

XI .N4

The India Rubber World

VOLUME LV

October, 1916, to March, 1917

VOLUME LVI

April, 1917, to September, 1917

New York:

THE INDIA RUBBER WORLD PUBLISHING CO.

1917

Vol. LVII

OCTOBER 1, 1917

No. 1

A

Abdominal Elastic Belt, "Auto-Body".....	*459
Accelerated Aging Tests, Value of (Correspondence) 277	
Accelerators, Organic, Brief Review of the	190
Accelerators, Vulcanizing	452
"Accident Prevention, Industrial" (Book Review) 80	
"Accounting Methods, Unified, for Indus- trial".....(Book Review) 461	
Adamson Law: Railway Service Must Be Maintained	(Editorial) 375
Adhesive Coatings, Preparing and Apply- ing Without Solvents.....	*525
Adhesive Plaster, Rubber-Coated.....	19
Aeronautic Exposition, Pan-American, First 263, 351	
Aeronautic Manufacturers' Association.....	351
Agnew, G., Death of.....	210
Air Hose, "Resistol".....	*84
Air Pressure in Tires, Method of Determin- ing	21
Air Supply Device for Rubber Boots (Correspondence)*659	
Aircraft, Italian, in the War.....	*511
Airplanes, Rubber Hose for Use on.....	520
Airplanes, Thirty-Five Hundred for 1917....	*576
Akron Rubber Trade...36, 97, *162, 163, *222, 223, 288, 353, 413, *474, *543, *607, 671, 738	
Aligning Motor Car Wheels.....	*32
Allis-Chalmers Steam Turbine and Alterna- tor Unit	*586
Alloy for Rubber Molds, New.....	455
Alkire, W. Scott, Death of.....	730
America on the Seas.....(Editorial) 375	
American "Blimps" a Success.....*575	
Capital in Eastern Plantations (Correspondence) 404	
Chemical Industry, Advance of (Editorial) 125, 126	
Chemical Society Convention and Expositi- on (portraits of Messrs. Weber, Pear- son and Tuttle).....	*6, 718
Chemical Society, Rubber Section, Fall Meeting	584
Rubber Section, Boston Meeting (Editorial) 696	
Competition in Tires Resented.....	260
Exports, Heavy, Due Chiefly to the War..	192
Grown Para Rubber.....(Editorial) 568	
Merchant Marine, Rubber and A (Editorial) 188	
Rubber Industry After the War (Editorial) 187	
Society for Testing Materials Rubber Nomenclature, A. S. T. M.....	384
"Textile Directory, 1916, Official" (Book Review) 80	
Americanization Activities in Rubber Mills.	711
Anchorage for Cords of Cord Tires.....	*589
Anderson, William O., Death of.....	661
Aniline Method for Determination of Min- eral Fillers.....	70
Aniline Oil Poisoning.....	10
Testing	*131
Appleton, Jr., Captain Francis H.(Portrait) 666	
Arizona, Egyptian Cotton in, by Irrigation..	*378
Ocotillo Rubber of	*75
Army and Navy Dependents, Care of.....	574

B

Artillerymen—Do Rubber Heels and Soles Protect?	(Correspondence) 597
Asbestos for Tire Fabric.....	218
Sheet Packing, Compressed, "Klingerit" Type	204
Sheet Packing, Machine for Making.....	*521
Association for Better Legislation, An (Editorial) 440	
Auto Bucket and Anti-Draft Shield.....	*336
Shade, No-Glare, With Rubber Washer....	*526
Automatic Mixing Mill.....	*456
Strength and Elasticity Tester.....	*329
Automobile Accessory Week.....	218
Nomenclature	(Book Review) 80
Automobile Pedal Pads.....	*86
Show, Seventeenth Annual.....	261
Tire Fabrics	*701
Tire, Three-Section	*218
Topping, Dridek.....	*590
Automobiles, "No-Man" Top for.....	*334
"Stik-Tite" Window Curtain.....	*334
Automotive Engineers, Society of.....	448
Annual Banquet of.....	263
Tire and Rim Division Report.....	578
Aviation Cord, Elastic.....	*726
Aviator's Hood	*398
Babco, Edward S.....(Portrait) 604	
Bag, "Goodie," With Elastic Bands.....	*147
Bait, Rubber Pork.....	*397
Ballata Industry in Dutch Guiana	230
Ball, Combination.....	*526
Balls, Toy, Decorated.....	*18
Band, Handy Rubber.....	528
Bark Rot of Hevea in Burma.....	105
BARNARD, JOHN E.— Financing an Industrial Village.....	*450
Housing the Connecticut Mills Employees..	*342
Port Sunlight a Model Industrial Village..	*386
Barrier, Edward A.....(Portrait and Sketch) 345	
Bates, J. F., Death of.....	278
Bathing Cap, Howard's Ideal.....	*528
Cap, "Liberty".....	*655
Cap Machine, Squires.....	*198
Cap, Non-Breakable.....	*146
Cap Novelty.....	*458
Caps for the Coming Season.....	*334
Costume Novelty.....	*526
Read Press, Seven-Platen.....	*455
Bed, Twin, Outing Trailer.....	*591
Belting, Rubber Replacing Leather.....	555
Bennett, J. Quincy, Death of.....	211
Benton, C. O., Death of.....	278
Bethune, Sir Alexander Sharp, Death of (Portrait) 531	
Bias Cutter, Bolton Vertical.....	*721
Take-Up, Stevens.....	*200
Bicycle Riding is on the Increase (Editorial) 568	
Rinns, H., Death of.....	210
Blanchard, F. C., Death of.....	340
Blanket and Anron, Rubber, Goodrich.....	*19
"Blimps," American, A Success.....	*575
Blow-Out Patch, "Buckle-On".....	*204
Bolivian Rubber Notes.....	746
Boll Weevil—A Menace to the (Correspondence) 277	
Bolt, Pneumatic Security	*274
Boston Rubber Trade...36, *98, 162, 223, *287, 352, 414, 475, 543, 606, 671, 739	

Bourne, Lyman M., Death of(Portrait) 593	
Bowers' Specific Gravity Tables.....	645, 709
Bowes, Robert J., Death of.....	34
Braender, Philip, Death of	(Portrait) 153
Braider, The New Era.....	*455
Brazil Rubber Statistics ..53, 112, 176, 239, 303, 369, 420, 497, *551, 623, 688, 750	
"Brazil To-Day and To-Morrow." (Book Review) 727	
Brazilian Rubber Notes.....	613, 679
BRIGGS, LAURENCE P.— Plantation Rubber in Cochin China—II... *	3
Plantation Rubber in Cochin China—III... *	136
British Chew Gum, The.....(Editorial) 126	
Embargo, List of Rubber Materials.....	610
Guiana, Plantation Rubber in.....	46, 552
Motorcycle Belts	*206
Rubber Associations	(Editorial) 316
Brushes, Hand and Power, for Rubber Workers	267
Buckleton, Captain Ernest E.....(Portrait) 510	
Burette Reading, Device for.....	*650
Burma, Bark Rot of Hevea in.....	105
Burner, Adjustable High-Temperature.....	*328

C

Cable Market Reports...50, 109, 174, 236, 305, 363, 427, 488, 557, 618, 683, 750	
Calculator, Tensile Strength.....	*83
"Camp-Mobile," The.....	*203
Canada, Rubber Statistics ..57, 118, 181, 241, 310, 370, 433, 499, 622	
Canadian Trade Index.....(Book Review) 207	
Caoutchouc, Synthetic.....	131
Carburizer, Pruden Powdered Coal.....	*721
Carelessness, Penalizing	(Editorial) 376
Carrel-Dakin Solution, Mulford Apparatus for Applying	*656
Carton Erecting and Filling Machine, Wills.*	392
Castilloa Knife, Belgian Expert Devises (Correspondence) 209	
Caustic Soda Dissolver.....	*199
Cement Can, Convenient.....	*14
Tube Filling and Closing Machine.....	*587
Cements, Plastic, Rubber in.....	385
"Ceylon Agricultural Society, Year Book" (Book Review) 400	
Ceylon and Malaya, Crop and Rainfall....	*43
Ceylon Rubber Statistics...51, 111, 175, 236, 305, 364, 431, 489, 558, 618, 684, 751	
Chains for Dual Solid Tires, French Type..	*79
Chandler, John J.....(Portrait) 534	
"Chemical Analysis, Standard Methods of" (Book Review) 461	
Chemical Convention & Exposition (Portraits of Messrs. Weber, Pearson and Tuttle) *6, *69, 127	
"Chemical Directory of the United States" (Book Review) 529	
Discovery and Invention in 20th Century (Book Review) 592	
Engineering Catalogue.....(Book Review) 462	
Engineers' Boston Meeting.....	718
Industries, Third National Exposition, 585, 719	
Industry, American, Advance of.....(Editorial) 125	
Patents ...12, 74, 131, 133, 197, 269, 325, 388, 453, 519, 582, 650, 717	
Patents and Allied Patent Problems (Book Review) 727	

Society, American, Rubber Section Meeting at Boston (Editorial) 584, 696	Chemicals & Compounding Ingredients, Market for60, 121, 185, 244, 312, 372, 436, 502, 564, 624, 691, 758	In Licensed Export List..... 643	"Chemistry and Physics, Handbook of" (Book Review) 400	And Technology of Paints..(Book Review) 275	Applied, Reports of the Progress of (Book Review) 727	Chemistry, Industrial, Elements of (Book Review) 206	Chemistry, Methods of Analysis.....11, 73, *131, 265, 325, 389, 453, 519, 580, 650, 717	"Chemists, German-English Dictionary for" (Book Review) 461	Rubber, What They Are Doing.....10, 73, 131, 195, 264, 325, 387, 451, 517, 580, 648, 716	Trained Rubber, Call for.....(Editorial) 696	Chewing Gum, The British Advocate (Editorial) 126	China, Importance of Forestry in. TABLE OF CONTENTS ON LAST PAGE OF READING.

A PENSION PLAN FOR MUTUAL BENEFIT.

ANOTHER large firm has adopted the pension system in the belief that it will benefit both employer and employee. Realizing that the certainty of a competence in old age offers a great incentive to faithful and efficient work and also tends to minimize unrest and discontent, the Crompton & Knowles Loom Works, of Worcester, Massachusetts, and Providence, Rhode Island, which supplies equipment for rubber manufacturers, has instituted a liberal, retroactive plan to reward upon retirement those of its 2,600 operatives who have grown old in the firm's employ. The scheme is based proportionately upon the length of service and the average monthly wages. An employee whose earnings have averaged \$60 monthly for 25 years prior to his retirement will receive annually the minimum pension, a sum equal to the income from \$4,500 at the usual 4 per cent savings bank rate of interest, the principal obviously being equivalent to yearly savings of \$180 for the 25 years. On this basis a man with a record of 25 years' service will receive \$180 annually; 30 years' \$216; 35 years, \$252;

40 years', \$288. When the average wages have been greater than \$60 monthly the pension principal will be increased proportionately. For example, average earnings of \$90 monthly for a period of 40 years will increase the principal to \$10,800 and the pension to \$432 annually; in other words, the retired employee will derive the benefit corresponding to the income from accumulated yearly savings of \$270 for the entire 40 years.

In its announcement the firm emphasizes particularly the advantages of long service on the part of its operatives by reminding them that many large employers will hire absolutely nobody over 45 years of age, however skilled, for a permanent position; also that as a physical examination is frequently required it will become increasingly difficult to procure employment in new situations beyond that period of life. The net result of the plan will doubtless be to retain the most valuable operatives and to cause them of their own volition to seek retirement when incapacitated for further efficient service.

RUBBER PROSPECTS IN FRENCH INDO-CHINA.

THE growing importance of plantation rubber in French Indo-China has led us to publish in full the informing report of Lawrence P. Briggs, the American Consul at Saigon. Beginning with a product of 55 tons in 1909 it increased to 297 tons in 1915. For the present year, however, the increase is far more rapid. The first quarter of 1916 shows a product of 257 tons, or nearly as much as was exported in the whole of 1915. And that this growth is to continue is shown by the conservative estimate of O. Berguet, president in charge of the Association of Rubber Planters of French Indo-China, which is 4,000 tons in 1920. The product will doubtless far exceed this, for rubber growing has been found so profitable and the colony is so well represented by the Planters' Association, that much French, and no doubt American, capital is sure to be attracted to further *Hevea* planting in French Indo-China.

"IT SHINES FOR ALL" BUT THE RUBBER MEN.

THE uniformly sage, sane and sensible "Sun," New York, dropped a stitch in its news fabric September 8, when it published an article entitled "Artificial Rubber," etc. It was readable,—indeed, to the uninitiated, plausible,—and is being copied by other newspapers, but its inaccuracies were so glaring that we cannot forbear from gentle criticism.

For example, the writer says:

At the beginning of the war the European Government

discovered, what indeed was generally foreseen, that they would have to obtain the bulk of their rubber, raw and vulcanized, from the United States.

Read the "Central Powers" instead of "European Governments" and this would pass. The other powers depend upon England for their rubber.

Speaking of French rubber reclaiming, the writer avers:

Washing with steam is the method usually adopted, which drives off the sulphur in fumes and melts the rubber without burning it.

"Washing with steam" is bad enough but "melting"! Melted rubber is a sticky, tarry, offensive mess that always remains sticky, tarry and offensive. Melting never has been, and never will be, a part of any rubber manufacturing process.

Continuing, he says:

The one thing which this peculiar art of making old rubber feel and look like new requires is to restore the elasticity and compressibility of the original rubber, but this unfortunately it fails to do.

Compressibility? Is rubber, then compressible? Or water? We thought not.

Solemnly he states, a line or two further along:

They are now making rubber from gelatine.

Of course, and of course, they are emphatically *not*. Further on he iterates:

It is stated that the rubber which remains behind can be vulcanized so successfully that the final product has all the properties, elastic and compressible, of the best Para rubber. Compressible again after what we said above! Our temper is going fast.

And as a final insult to anyone's intelligence, this melter and compressor of rubber, cites the old glue and glycerin formula, the gas tubing cover, the tire filler compound. Artificial rubber? And in the "Sun"!

THE COST OF WET RUBBER.

FOR the fiscal year ending June 30, 1916, the United States imports of plantation rubber were over 90,000 tons. The shrinkage on this amount may be reckoned at two per cent, or 1,800 tons. The same quantity of wild rubber; figuring a 20 per cent shrinkage, would lose 18,000 tons.

Freight rates from the Far East for 1915 may be reckoned at 2½ cents per pound, or \$56 a ton. Therefore, manufacturers paid somewhere in the neighborhood of \$100,800 on freight alone, on the water contained in that plantation rubber.

But had this been wild rubber with a shrinkage of 20 per cent, the contained water would have cost the importers \$1,008,000 for freight, besides an extra amount for insurance, etc., not reckoned herein.

This, however, is not all the saving. It is estimated that it costs one-half cent per pound to wash and dry wild rubber, or \$11.20 per ton, and to wash 90,000 tons would

cost another exactly equal amount, namely, \$1,008,000. In other words, the year's consumption of plantation rubber was cheaper by over \$2,000,000 than would have been an equal amount of wild rubber.

This is why wild rubber, if it is to compete, should come to the market clean, and with a greatly limited shrinkage.

A LATIN-AMERICAN VIEWPOINT.

A SOUTH AMERICAN importer was asked why he always bought European-made tires and refused to handle the American product. For reply he brought out a circular of a well-known American-made tire and pointed to the statement, "We make 5,000 tires a day." He then produced a circular of a European-made tire that claimed, "In our factory 500 tires are made every day." Shrugging his shoulders, he said: "Five thousand tires a day means haste and carelessness. Five hundred a day, care and finish. That is why."

THE NATIONAL RETAIL DRY GOODS' ASSOCIATION is advocating the passage of an "Anti-return Goods Law." If the return of goods could be regulated equitably for both buyer and seller it would be of inestimable value, particularly to the makers of the goods. The rubber trade is a great sufferer through unfair claims, adjustments and returns. Why should not the alert and enterprising Rubber Club of America, Inc., force reforms in this field?

"KEDS" IS THE NEW NAME FOR TENNIS SHOES TO BE used hereafter by all who make or handle the footwear of the United States Rubber Co. As a bit of word coinage it is clever and original and will go far toward killing the popular but objectionable term "Sneakers."

A RUBBER HEEL EXPERT ESTIMATES THAT THE AVERAGE man takes 8,000 steps a day. An engineering authority reckons that a 180-pound man raises his feet two inches (or more) from the ground in walking, and that the impact of his heel is 30 foot-pounds each step. Now, the average rubber heel lasts three months. Eight thousand steps a day means 720,000 steps in ninety days. The mechanical engineer thus deduces that the total impact, or shock of three months' walking would be 21,600,000 foot-pounds. What, besides rubber, would withstand such constant pounding? Wood would be battered to pieces; stone reduced to impalpable powder; iron flattened out to a thin disk; gold beaten so thin as to be almost transparent. Rubber outwears them all, and that is the cause of its marvelously increasing use for heels the world over.

Plantation Rubber in Cochin China—II.

By Lawrence P. Briggs, United States Consul at Saigon, French Indo-China.

GETTING POSSESSION OF THE LAND.

AFTER deciding on a location, the next step is to get possession of the land. Theoretically, the government of Indo-China permits the acquisition of domain lands by gift or by auction sale under certain conditions of cultivation.

Free concessions apply only to tracts of 50 hectares or less. Application must be made on stamped paper to the administrator-in-chief of the province in which the land is located, indicating clearly the location of the land, its approximate extent and boundaries, and enclosing a rough sketch of the tract. In the case of tracts exceeding 10 hectares, the application must also be accompanied by the fee for the administrative inquiry, which fee is uniformly 20 cents (about 10 cents United States currency) per hectare. The application is then registered and a receipt signed by the administrator is returned to the applicant. Then for two months the administration posts notices of application (1) on the land, whose boundaries should be marked by the applicant; (2) at the town hall of the village where the land is located, and (3) on the door of the office of the administrator of the province. At the end of the two months the application is delivered, together with the report of the native authorities and the protests of third parties, if any, to a special investigating committee composed of the following officials: the administrator-in-chief of the province, president; the chief, or under-chief of the canton, and two notables of the village. If the land is located in a forest region, an agent of the Forestry Service is added to this committee. The applicant, the owners of the adjoining property and the occupants of the tract, if any, are duly summoned and sign the official report (process-verbal), formulating in it all observations and reservations which they consider necessary. When informed by the administrator of the conclusions of the committee the applicant, if he accepts, deposits with the administrator a map of the land and an official report of its location and delimitation. These reports and documents are sent to the governor of the colony, who, if he approves, will put the applicant in possession of the land. The applicant must establish his domicile on the plantation, or at the seat of the province, and must put the concession under cultivation, within three years in the case of concession of 10 hectares or less and within five years in the case of 10 to 50 hectares, under the penalty of forfeiture of all or part of the land granted. If at the end of this period all the

conditions have been complied with, the holder of the concession is granted a definite title to his land.

In actual practice, however, no rubber estates of any consequence are ever granted gratuitously in French Indo-China. In the case of tracts of more than 50 hectares the land is sold at public auction. Application is made in the same way as for a free grant, and the notice is the same, except that it must also be published for two months in the "Bulletin Administratif" of the colony and the "Moniteur des Provinces." A similar committee meets and fixes the price of the land and other costs. The applicant

may establish his residence at the capital of the protectorate instead of either of the places mentioned in the preceding paragraph, and the reports and specifications (*cahiers des charges*) must be approved by the governor in council. After approval notice must be given, from 15 days to a month in advance of the sale, by placards printed in French and in the native language of the district, naming the day, hour and place of the sale. These placards must be posted (1) on the door of the office of the administrator of the province, (2) at the town hall of the village, (3) at the town halls of neighboring villages and (4) in the government offices at Saigon. Notice must also be published in the "Bulletin Administratif" and the "Moniteur des Provinces." All persons wishing to bid on this land must deposit a sum equal to one-fourth of the minimum price when this amount exceeds 100 piastres, which sum will be returned to all except the successful bidder. All terms, conditions and reservations are fixed by the specifications (*cahiers des charges*) signed by the investigating committee and by the applicant or someone holding his power

*Bleekroden, an indigenous rubber tree in French Indo-China over-tapped by natives.**

of attorney. The purchase price is paid by the successful bidder in two instalments—one within 20 days of the sale, the other a year later. Upon the fulfilment of all the conditions of the *cahiers des charges* a definite title is granted by a special decree of the governor in council. The price paid in the past for rubber lands sold at public auction has varied from 50 cents to 5 piastres per hectare.

In the case of rubber lands, all grants, whether by free title or

*The *Bleekroden* is indigenous to Indo-China, if properly tapped, yields a quickly coagulating latex. The caoutchouc, when separated from impurities, is pronounced of excellent quality, and has sold at 70 to 80 per cent of current prices for fine Para. The natives hack the trees so ruthlessly as to prevent proper flow of the latex, and frequently to such extent as to endanger the life of the trees.

by public auction are made under certain conditions of cultivation. In all grants up to 500 hectares, one-tenth of the grant must be planted each year with at least 120 rubber trees per hectare, so that half the grant is under rubber cultivation at the end of five years, under the penalty of forfeiture of all or part of the estate. This time is extended to ten years in the case of grants exceeding 500 hectares. For the remainder of the concession the holder may leave it in waste land or pasturage or plant it to rice or other cultures. But a definite title will not be granted until half the plantation is under cultivation. An administrative committee visits each grant in November of each year to see that all these terms are complied with.

For the first seven years a rubber grant is exempt from land tax. At the beginning of the eighth year one-tenth of the estate is subject to the impost levied on the first class of "various cultures" (275 piastres per hectare), and the uncultivated half is subject to the impost on the third class of various cultures (48 cents per hectare). After the tenth year one-half of the estate is subject to the first-class tax, the other half to the third-class tax.

All these terms and conditions are applicable to foreigners under the same conditions as to French citizens or colonists.

Rubber lands, planted or unplanted, may also be purchased of private individuals from time to time. During the past year several small plantations were offered for sale. The foreigner should be wary about purchasing a small estate, for rubber production in the past has been largely an experiment, and there has been some reckless tapping, especially on the smaller plantations. The larger estates are generally held by joint-stock companies. Their shares are sometimes offered for sale by the notaries of Saigon through the columns of the local papers and especially those of the "Bulletin Financier de l'Indochine." At present it is practically impossible to purchase stock in the better plantations.

A few cases may serve to illustrate the prices at which these plantations have been sold or offered for sale during the past year. The most important deal in rubber plantation property since the beginning of the European war was the sale in May, 1915, of the plantation of Tan-thanh-dong. One of the leading stockholders of this firm was a German; so the firm was dissolved and the property sold. The amount received was 225,000 piastres. This was considered a very low price; but the sale took place before the phenomenal rise in the price of rubber and under conditions which may have restricted the number of bidders and limited the amounts offered. In November, 1915, a small plantation near Saigon was offered for about 30,000 piastres. This plantation consisted of 450 hectares, of which 150 hectares were planted with 50,000 trees a little more than five years old and ready to be tapped, a nursery containing more than 150,000 young trees and some timber and buildings. While these cases may have some significance, they do not indicate the prices at which the best rubber plantations are now held.

CLEARING AND PLANTING.

Some of the older plantations were located on cultivable or prairie land, but in the red soil region the clearing of the plantation is a more serious problem. The vegetation is tropical and dense, and the stumps and roots must be removed or in the moist, hot season they will furnish a hotbed for mold and other plant diseases. In spite of the cheapness of native hand labor (10 to 20 cents per day), the clearing of a plantation sometimes costs as much as 25 piastres per hectare [over \$5 per acre]. However, the vegetation is less dense, the rainfall less constant and the cost of clearing less expensive than in the more tropical climate of neighboring rubber producing countries.

Before the plantation is ready, a small tract of land is prepared as a nursery. Here the seeds are planted, generally toward the end of the rainy season (September to January). The young

plants are sheltered from the sun during the dry season and at the beginning of the rainy season (May or June) they have attained a height of 1.50 to 1.80 meters [5 to 6 feet] and are ready to be transplanted. Holes are dug 80 centimeters to 1 meter [32 to 40 inches] in depth and wide enough to accommodate all the roots. On the earlier small plantations the trees were planted very close together. The larger plantations—Xatrach and Suzannah—at first adopted $4\frac{1}{2}$ by 5 meters; but this distance was found too small, and the later plantations have generally left a space of 6 or 7 meters between trees.

CARE OF THE PLANTATION. DRAINAGE, CULTIVATION, IRRIGATION, FERTILIZATION.

The question of drainage is sometimes an important one in Cochin China; for the whole delta region is subject to inundations from July to November, while in some parts of Cochin China the rainfall from May to October, inclusive, averages over 20 inches per month, and during some months it is sometimes as great as 30 inches. Up to the present time no precautions have been found necessary against the invasion of the waters of the Mekong and other waters coming from lower levels, and it is unlikely that any such precautions will ever be necessary, because most of the good rubber lands are somewhat higher than the flooded delta district. But it has been found necessary on nearly all these plantations to provide ditches and sometimes large reservoirs for the drainage of excessive rainfall or the overflow of neighboring streams during the long, wet season.

The soil between the trees is kept soft by plowing and kept clean by constant weeding. The larger plantations have steam plows of 60 to 100 horse-power but the smaller ones use native wooden plows or ordinary American steel plows drawn by native cattle or *carabao*. The weeding is generally done by hand.

The dryness of the months from November to April, and especially from January to March, makes irrigation necessary on nearly all the rubber plantations of Cochin China. The rainfall during these months averages as low as 2 inches per month. Sometimes there are months with no rain, but this is not common; and the uniformly cool nights during this season combined with the always humid tropical atmosphere provide a little moisture by condensation. Water can often be stored during the rainy season. At any rate, streams are abundant and underground veins are everywhere near the surface. Ditches and reservoirs, useful for both drainage and irrigation, are found on practically all the rubber plantations. A few of the smaller plantations employ stationary hand-pumps or movable double-balance, two-cylinder, suction drainage pumps of 4,000 or 5,000 gallons capacity per hour. On the larger plantations the type of pump most in use is a mounted centrifugal, gas or petroleum motor-pump of 10,000 to 50,000 gallons per hour. The type and make of pump used varies with conditions, but Worthington pumps of various styles find a comparatively good sale.

Up to the present time the use of fertilizer has been very small and practically confined to some of the older gray soil plantations and the nurseries. The substances used have been stable manure, oil cake, malt, azote, potash, phosphates and superphosphates. On the red soil plantations nothing but stable manure has been used. The larger plantations have small herds of cattle and employ the manure in the nursery and around the roots of the young trees. The time will undoubtedly come when the use of a small amount of fertilizer will be necessary to supply the lacking soil constituents discussed in a previous paragraph of this report.

TREE ENEMIES AND DISEASES: NEW PLANTS AND SEEDS.

As has been stated in a preceding paragraph, the principal enemies of the rubber tree in Indo-China are water, drought and typhoons. This region seems to be singularly free of rubber diseases. The long, dry season has its drawbacks, but it seems to insure the trees against mold and similar maladies common to other rubber regions of the more tropical Orient. There has

never been even a slight epidemic of any kind in the rubber region of Indo-China.

At first seeds and even plants were imported into Cochin China from Ceylon, Singapore and Java; but the presence of cryptogamic diseases in the rubber trees of these districts, led to a decree in 1910 prohibiting the importation of *Hevea* plants into Indo-China and providing for the disinfection of imported seeds. Since that time new plantations have generally purchased their initial plants or seeds of the Belland, Ong-Yem and other earlier plantations.

SECONDARY CULTURES: USE OF MACHINERY.

Secondary cultures do not yet form an important element in the rubber plantations of Cochin China. A little rice and sometimes maize is raised for the employes and the stock, and a certain amount of land is devoted to pasturage. The amount of land given over to these purposes will necessarily increase when land is worn and the need for fertilization with stable manure or by turning under a crop becomes more pressing. Cocoanuts and other native fruits are often raised, especially on the small native plantations. The Locninh plantation has about 300,000 coffee plants, the Xa-cam plantation about 115,000, the Delignon plantations in Annam about 125,000, and other plantations a smaller number, making in all about 550,000 coffee plants. A small plantation in Cochin China has about 11,000 cashew trees, one in Annam about 10,000 kapok plants and another raises annually several hectares of Soya beans.

The cultivation of these secondary cultures in connection with that of rubber demands a variety of agricultural implements. The smaller plantations use native hand-made plows, harrows, hoes, spades, etc., but the larger plantations use modern machinery, such as traction plows, harrows, rollers, trucks and mowing machines. The motive power is sometimes native cattle and *carabao* and sometimes steam. With the development of this industry, both intensively and extensively, there will come a greater demand for agricultural machinery.

Agricultural machinery is sometimes purchased in France by the Paris representative of the plantation, but it is generally bought of local importers. In either case it is imported from France, although much of the machinery is of American origin. The leading Saigon importers and dealers are Descours, Cabaud et Cie, Graf, Jacque et Cie, and Bonnefoy Freres. The directors of these firms are also directors of large rubber estates in Cochin China.

TAPPING AND GATHERING.

The rubber trees of the gray soil plantations are generally tapped at the age of five or six years. By this time they have attained a height of 15 or 20 feet and a circumference of about 18 inches. On some of the red soil plantations the trees reach this size during the fourth year and are tapped at this age. The half-herringbone method is almost universally employed. The trunk is usually divided into fifths and two of these parts tapped at once over an up-and-down extent of about 20 or 30 inches per year. The tapping is generally done every day—except during the months of January and February—the middle of the dry season, when the trees are given a rest.

The table given below shows the volume in cubic centimeters of latex produced each month by groups of selected trees on the experimental station at Ong-Yem during 1910:

Month	10 Trees.	20 Trees.	42 Trees.
January	1,713	895	Not tapped
February	1,253	4,159	Not tapped
March	1,520	9,821	3,865
April	1,740	8,962	15,225
May	1,557	9,034	15,110
June	5,595	9,720	14,138
July	4,795	7,680	11,585
August	7,194	11,073	12,330

Month	10 Trees.	20 Trees.	42 Trees.
September	5,635	12,312	11,586
October	7,632	10,164	11,593
November	7,730	11,581	8,912
December	7,439	9,610	2,962

Experiments made at the same time show that the weight per cubic centimeter of the latex is a little greater during the season of heavy production but that it contains a smaller percentage of rubber than during the dry season. The density of this latex varied from .88 to .98 grams per cubic centimeter, the amount of dry rubber produced per gram of latex varied from .30 to .72 grams. Making due allowance for unusual conditions, these tables give a fair composite picture of the relative productivity of the different seasons of the year.

The latex is gathered daily. A native can tap from 300 to 400 trees a day and gather latex from about an equal number. At the Suzannah plantation, where native labor is very efficient, the director hopes to bring this amount up to 600 trees per man and 450 trees per woman. Since the beginning of rubber cultivation in Cochin China the average annual rubber production per tree has been about three-quarters of a kilo; but the old Belland plantation claims an average of 2½ kilos for 1915, and some portions of the newer plantations are said to average over a kilo per tree. As the above tables will show, selected groups of trees at Ong-Yem have produced over 5 kilos each per year. In considering these figures it must be borne in mind that up to the present time most of the trees tapped each year are new and that the trees have been planted too close together to obtain the best results.

METHOD OF PREPARATION.

The methods of preparation vary slightly on the different plantations. The first step is to strain the latex. To prevent the too rapid coagulation a little water is sometimes placed in the receptacles in which it is collected. The latex is strained through a fine sieve, which collects all the leaves and other impurities, and is then placed in porcelain-lined basins about 8 by 12 inches and 3 or 4 inches deep and allowed to coagulate. Sometimes a solution of acetic acid is added to assist the coagulation.

The coagulated mass is then passed several times through one or more sets of rollers until it is pressed into thin sheets. Some plantations have a heavy set of smooth rollers which merely press the rubber into sheets and smaller rollers which impress a design upon them. The rollers are generally of steel or zinc. One of the leading plantations has employed copper rollers, but is considering a change due to the objections of prospective purchasers of the product. When finished the sheets are about 11 or 12 inches wide, 20 to 24 inches long and ⅜ to ¾ inch in thickness. These sheets are then taken to the drying room.

The strainings of the latex, the lumps found on straining, the water left in the cups, basins and other receptacles and the foam and other skimmings after straining are prepared into various grades of rubber and "scraps."

The rubber is sometimes dried by natural air in a closed room, sometimes dried with hot air and sometimes simply exposed in a dry place to the tropical atmosphere. The first of these methods is followed at Natrach, the second at Suzannah and the third at the Belland plantations and in general at all the smaller plantations. The Suzannah plantation has a \$14,000 drying plant, consisting of an "Ouragan" mechanical drier operated by a 75 horsepower motor. The rubber produced on this plantation is ready for market within ten or twelve days after leaving the tree, while on other plantations of Cochin China the preparation of the rubber requires from twenty to thirty days, according to the season. Some plantations smoke the sheet rubber in the closed room by conducting wood-smoke into the room through a pipe; others by the addition of a little creosote to the latex.

(To be continued.)

The Chemical Convention and Exposition.

THE fifty-third annual meeting of the American Chemical Society was held in New York City the last week of September, and in point of attendance and interest far exceeded any previous meeting. More than 2,000 members registered at the Chemists' Club during the week. Meetings were held on the first five days of the week, some of them being at Columbia University, others at the Chemists' Club, the New York College of Pharmacy, and the Grand Central Palace. At this latter building was held during the week the Second National Exposition of Chemical Industries, 200 firms and companies making exhibits.

During the forenoon of Monday, at the Chemists' Club, a committee was busy registering the names of visiting members, a large number of whom were accompanied by their wives. To each was presented a badge which was an open sesame to most of the functions on the program. At this club, rooms were set apart for visiting ladies, a large committee of ladies having charge of this portion of the program. Here also the reception rooms and the large dining room were thrown open to members and visitors, while the chairmen of the various committees were on hand to fulfil the duties assigned to them.

The formal opening of the exposition was held at the Grand Central Palace on Monday afternoon, the opening address being by President Charles H. Herty, and other speeches by Dr. Francis A. J. Fitzgerald and Dr. Arthur B. Daniels.

On Tuesday, at the general meeting of the society at Horace Mann Auditorium, Columbia University, J. Merritt Mathews, president of the New York section of the American Chemical Society, presided, and addresses of welcome were made by Dr. Haven Emerson, Health Commissioner of the City of New York, and President Butler, of Columbia University.

In accordance with the general program the various divisions held meetings at which papers were read pertaining to that special portion of the industry to which the division was devoted. Among the papers read in other divisions than the Rubber Section which would be of interest to the readers of this journal, and which, therefore, may be accorded attention in the coming number, are: "Showerproofing," by E. L. Mack; "Vulcanization of Rubber," by D. Spence; "Aniline and Other Coal Tar Products," by George P. Adamson, and "Bureau of Mines Studies on Occupational Diseases," by Dr. W. A. Lynott, Washington, D. C.

The evenings were set apart mainly for social functions. On Tuesday a reception was held at the Hotel Astor, where members, guests, and members of the American Electrochemical Society and Technical Association of Pulp and Paper Industry were present. On Wednesday evening the Electrochemical Society held a smoker, members of the American Chemical Society being their guests. Thursday evening a grand banquet was held at the Waldorf-Astoria. Friday afternoon and evening were devoted to visiting the exposition at the Grand Central Palace. Meanwhile a special program was laid out for the visiting ladies, this being in charge of an able and efficient committee.

Taken altogether, the convention was most assuredly the best in the history of the society. In the completeness of arrangement, great credit is due to the officers and committees having the details in charge, including President Charles H. Herty, Secretary Charles L. Parsons, the chairmen of the various meetings; Carl L. Alsberg, Edward Bartow, J. E. Breckenridge, C. G. Derick, H. E. Howe, Irving Langmuir, J. H. Long, L. M. Tolman and L. E. Weber, and the following committees:

EXECUTIVE. J. M. Matthews, chairman; Frank Hemingway, treasurer; L. H. Baekeland, H. R. Moody, P. C. McIlhiney, E.

G. Love, T. J. Parker, Allen Rogers, T. B. Wagner, A. E. Hill, C. M. Joyce, Chas. F. Roth, secretary.

FINANCE. L. H. Baekeland, chairman; Carleton Ellis, J. B. F. Herreshoff, E. G. Mackenzie, T. B. Wagner.

REGISTRATION. H. R. Moody, chairman; Chas. F. Bacon, D. D. Berolzheimer, Charles A. Lunn, F. J. Metzger, A. Nagelvoort, A. C. Neish.

RECEPTION. P. C. McIlhiney, chairman; J. Alexander, S. R. Church, H. M. Ittner, R. W. Moore, J. C. Olsen, Emil Schill, M. Toch, H. A. Metz, H. Schweitzer, E. G. Nellis, V. G. Bloede, J. G. Bergquist.

ENTERTAINMENT. E. G. Love, chairman; H. A. Baker, T. W. Pritchard.

HOTEL. T. J. Parker, chairman; T. R. Duggan, J. M. Weiss.

PRESS AND PUBLICITY. Allen Rogers, chairman; Ellwood Hendrick, B. C. Hesse, T. J. Keenan, A. Nagelvoort, E. F. Roeber, Charles F. Roth.

THE RUBBER SECTION.

THIS was the first meeting to be held by the rubber chemists for a long while, and the large attendance seemed to prove that this section of the Chemical Society is capable of doing some real constructive and research work in the rubber industry.

The transactions of this section were held at Rumford Hall at the Chemists' Club. Dr. L. E. Weber, of Boston, Massachusetts, was chairman, and Dr. John B. Tuttle, of Washington, D. C., secretary. The papers included the following:

"A Revision of Wesson's Method for the Direct Determination of Rubber," by J. B. Tuttle and L. Yurow.

"Wet Combustion in the Nitrosite-Combustion Method for the Direct Determination of Rubber," by L. G. Wesson and E. S. Knorr.

"The Aniline Method for the Determination of Fillers in Rubber Goods," by Otto H. Klein.

"Increase of Resins in the Vulcanization," by L. E. Weber.

"The Second Report of the Joint Rubber Insulation Committee," William E. Del Mar, secretary.

"The Rubber Chemist and the Rubber Trade," by Henry C. Pearson, Editor of THE INDIA RUBBER WORLD.

CHANGES OF RESINS IN VULCANIZATION.

Dr. L. E. Weber's paper had been announced under the title "Increase of Resins in the Vulcanization," but in his introductory remarks, he pronounced this somewhat of a misnomer, because, under the conditions under which the experiments were carried out, an actual decrease in the resin content resulted in the vulcanization process in the majority of cases. Dr. Weber said:

It is a generally accepted fact that in the course of vulcanization the resins show a material increase, the term resins being a convenient abbreviation of what is more accurately referred to as the organic acetone extract. The amount of this increase is said to vary, but is usually in the vicinity of 1 to 1½ per cent. That is to say, the rubber will show an actual resin content of somewhere between 4 and 5 per cent, whereas before vulcanization its resin content was between 3 and 3½ per cent. The nature and cause of the increase is not understood, in fact the whole subject has received very little attention. That this is so is rather to be wondered at, especially when one considers the fact that the resin content is our most reliable guide in recognizing the presence of high grade rubbers.

It has without doubt been observed on numerous occasions that rubber compounds very rich in rubber do not show this increase, their resin content being approximately the same before and after vulcanization. It therefore seems reasonable to suppose that certain of the mineral ingredients which are present in the more highly compounded stocks are responsible for the

increase, and it was in the hope of determining which of these minerals were effective that the experiments enumerated below were carried out. In order to observe more clearly the effect which the various minerals exert on the resins during vulcanization, the more common minerals were added in varying amounts to a standard rubber compound and the increase in the resin content determined analytically. The basic compound consisted of 100 parts of rubber and 8 parts of sulphur. A series of compounds were mixed up containing rubber and sulphur in the identical proportions but with varying percentages of zinc oxide, litharge, lime, calcined magnesia, white lead, barytes and whiting. These minerals were added in percentages based on the rubber. For instance, a typical compound would read as follows:

Rubber, 100 parts; sulphur, 8 parts, and litharge, 5 parts.

Or again:

Rubber, 100 parts; sulphur, 8 parts, and zinc, 20 parts.

In this manner the effect produced by the various minerals could be noted readily with a minimum of calculation. Of course,

more marked as the amount added increases up to 50 per cent. Zinc also seems to follow the same rule in that the resin content decreases with the amount added, whereas in the case where zinc oxide and litharge were both present, decrease in the resin content is about the same as would have been produced by the litharge alone. The cases of lime and magnesia are very interesting, even the relatively small amounts of 5 per cent producing very marked decreases.

An explanation of the above observations is hazardous, in view of the limited amount of experimental data. It is at once apparent, however, that the substances which bring about decreases in the resin content are all of a basic nature, and the two materials which are particularly active, namely, lime and magnesia, have a relatively strong basic nature. In view of the known fact that the resins from *Hevea* rubber are in part saponifiable, it seems reasonable to suppose that salts have been formed in the vulcanizing process between the saponifiable resins and the mineral oxides, with the formation of acetone insoluble metallic resinates. It is

DR. LOTHAR E. WEBER.

HENRY C. PEARSON.

DR. J. B. TUTTLE.

in each case the resin content is based on the actual amount of rubber present. For the sake of convenience all samples were cured in the press at 45 pounds pressure for various periods, depending on the nature and amount of mineral added.

The following table shows the changes in the resin content of the crude rubber, the crude rubber vulcanized with sulphur alone, and the compounds containing rubber, sulphur and minerals in various proportions.

Crude rubber gave resin content of 3.54 per cent.

100 parts rubber and 8 parts sulphur gave resin content of 3.53 per cent, based on rubber present. Additions of minerals as follows gave percentages based on rubber present:

5 per cent litharge gave resin content	3.6 per cent
10 per cent litharge gave resin content	2.8 per cent
20 per cent litharge gave resin content	2.7 per cent
50 per cent litharge gave resin content	2.1 per cent
20 per cent zinc oxide gave resin content	3.4 per cent
50 per cent zinc oxide gave resin content	3.1 per cent
20 per cent white lead gave resin content	4.0 per cent
20 per cent litharge and } resin content	5.6 per cent
50 per cent zinc oxide {	
5 per cent lime gave resin content	2.5 per cent
5 per cent calcined magnesia, resin cont.	2.6 per cent
50 per cent whiting gave resin content	3.5 per cent
50 per cent barytes gave resin content	3.7 per cent

These figures are indeed surprising and directly in contradiction to what one would have expected. There is a much more marked decrease in the resin content than increase. To be sure, barytes and whiting are without effect one way or the other. This is more or less what one would have expected in view of their inert action in the vulcanization process. The addition of 20 per cent of white lead is the only case where there has been any appreciable increase. Even in this case the increase is so very small as to just lie outside the limit of analytical error. It is interesting to note the action of litharge. When added to the extent of only 5 per cent no change in the resin content is observed. There is a marked decrease on the addition of 10 per cent, which becomes

not improbable that a connection exists between the action of these minerals on the resins and the accelerating action which the former produce. This seems the more probable, in view of the fact that the elimination of the resins from the crude rubber practically inhibits vulcanization.

As already stated, the above samples were all vulcanized in the press, a fact which should be clearly borne in mind. The samples are at present being vulcanized in live steam and will doubtless show increased resin content on analysis. To be sure the introduction of live steam brings forth another factor into the vulcanizing process. From the above figures, however, it would seem, in the presence of metallic oxides, as if the primal tendency of vulcanization were rather to decrease the resin content than to increase it, probably owing to the formation of metallic resinates.

THE RUBBER CHEMIST AND THE RUBBER TRADE.

Mr. Pearson's address, in brief, was as follows:

As a text to my address I want to use a brief letter received this month from an old-time rubber superintendent—a man who has had an unusual measure of success, who is absolutely honest but thoroughly of the old school:

TO THE EDITOR OF THE INDIA RUBBER WORLD.

Dear Sir—A considerable space of every edition of your valuable magazine is given to "What the Rubber Chemists Are Doing."

It has been my privilege to talk with several managers and invariably each has a problem. When asked why not let the chemist work it out, they answer they have tried and failed to find the solution. Now is it true that chemists are of any advantage or only a fad, same as the game of efficiency that has been taken up by many, but is being gradually dropped? Chemistry and efficiency have their place in the world's work, but a good practical man

can make a rubber factory pay larger dividends than any corps of chemists running around with abstracted reasonings. If there is anything that gets the "goat" of a superintendent, it is to have some half-cooked chemist tell him how to run the factory. Very truly yours,

This naturally leads one to ask exactly what the status of the chemist in the rubber industry has been, what it now is, and is to be, and incidentally the status of the so-called practical man.

The beginnings of the industry, of course, were coincident with the discovery of vulcanization. Offhand one would say that Charles Goodyear was the discoverer—and he was, as far as the printed page goes. The fact, however, that before Goodyear's time the Indians up the Amazon were mixing gunpowder (because of its sulphur content), with rubber latex, spreading the mixture on cloth and exposing it to the strong rays of the sun, would really suggest that they had discovered vulcanization without knowing it. As they made no claim to such discovery, perhaps it would be well to let them go into the discard.

The discovery of vulcanization, as far as Charles Goodyear went, was the result of hundreds of experiments. It was the fortunate result of a constant groping after an ideal by an exceedingly pertinacious experimenter. That he didn't know exactly what he had done is proved by the fact that he patented the "triple compound," composed of rubber, sulphur and white lead and that for years after white lead appeared in every compound.

The English discoverer of vulcanization, Thomas Hancock, another practical man, worked for years trying to produce rubber compounds that would not get sticky in hot weather nor stiff in cold, and finally, securing through a friend named Brockedon a sample of the American vulcanized product, discovered sulphur on the surface. As a result he invented the type of vulcanization known as the sulphur bath. That is, he melted sulphur, immersed rubber in it, raised the heat and secured vulcanization.

About the same time Alexander Parkes, a chemist, produced a process of vulcanizing rubber by using chloride of sulphur; in other words, invented the cold cure.

In Germany during the years of the American and English search after vulcanization, Dr. Leudersdorff, of Berlin, through his own initiative, compounded rubber with sulphur, treated the surfaces with powdered sulphur, and at times got results that looked like vulcanization. He did not at that time appreciate what he had, but without doubt he would eventually have discovered vulcanization, even if the rest of the world had remained ignorant of it.

About the same time a Dutch apothecary named Jan Van Geun, who lived in Haarlem, put upon the market a rubber tubing that did not get stiff in cold weather, was not softened by heat and withstood acid. What his process was nobody knows, but the evidence goes to prove that he did discover vulcanization.

The matter thus stands, without counting the Indian, that the world's vulcanization of india rubber was discovered by two practical men, two chemists and a druggist.

American rubber manufacture divided itself into three periods. The first was of pioneering. In spite of the fact that vulcanization had been accomplished, the early manufacturers were a long way from being able to produce rubber goods in quantities, without a percentage of spoiled goods and seconds that would put any present manufacturer out of business. The early pioneers were Candee, Meyer, Poppenhusen, Day, Hartshorn, Hodgman and Hayward. None of these men were chemists, but they tackled their varied problems with undaunted courage and succeeded in spite of many failures. The next generation, which embraced the well-known names of Converse, Forsyth, Cheever, Spadone, Bourn, Banigan, Hood, Goodrich, McClymonds, Dale and Cowen, inheriting the compounds and processes of their predecessors, began to appeal to machinists and mechanical engineers to assist them in mechanical problems, and occasionally to chemists. In spite of this, the man who had worked up through the various processes, the practical man, was esteemed more than any other individual. It is only proper to say that he often possessed a high degree of skill, and that through his experience he was able to avoid many errors, and that his results showed in earnings that were sometimes remarkable. The old-time practical man was a czar when it came down to the question of compounding. In many cases he alone possessed the secret formulae, and if he left an employer he carried them with him.

To digress a moment, it might be interesting to cite one

of the formulae used by all of the great shoe factories during the early days. The upper compound, besides whiting, litharge, sulphur and tar, which were more or less necessary, contained white lead, lime and barytes. Just why, nobody knew. These ingredients, with the exception of the tar, were weighed out in quantity into a huge bin and then run through an old-fashioned burr mill for fineness. They were not known as compounds but as paints.

It must not be thought, however, that the practical men did not produce anything. They were the producers of excellent mixers, masticators, tubing machines, calenders and spreaders. They also designed scores of machines for the manufacture of belting, packing, hose, insulated wire and so on. When competition became fierce, they made bigger and better machines and cheapened their compounds where they could.

They also produced many valuable compounds and processes. Of these the most notable are the mechanical process for rubber reclaiming invented by Clapp, and the acid process invented by Mitchell, Bourn and McDermott. None of these men were chemists, although very early in his career as a manufacturer of reclaimed stock Mr. Mitchell employed chemists in consultation. Up to 1900 the chemist had made hardly any impression at all upon the rubber trade.

The writer was so impressed with the future usefulness of the chemist in rubber mills that he took occasion when opportunity offered to talk with the leaders of the trade, so as to learn their attitude regarding the possible value of a laboratory and a chemist in connection with their own problems. E. S. Converse stated that they had employed chemists, but that the cost to their company had been greater than any value received from their work. Joseph Banigan said, in a jocular vein, that "he had no use for chemists, druggists or apothecaries." L. K. McClymonds said that the value of the chemist would be simply in determining the purity of compounding ingredients, and that he hired a competent superintendent to look after that. Henry C. Morse said that he would give more for the guess of his old superintendent, Leigh, than for all the certainties produced by the best chemist on earth.

In those early days only two men took the chemist seriously. One was James B. Forsyth, of the Boston Belting Co.; but he had the misfortune to deal in secret with a man whom he believed to be a chemist, but who was really a charlatan and an expert user of chemical terms. It was a long time before Mr. Forsyth discovered that he was being fooled. Dr. Benjamin F. Goodrich, founder of The B. F. Goodrich Co., was the other man who thoroughly believed, almost from the beginning, that rubber manufacture was as much a chemical problem as a mechanical one. Very early he employed a German chemist, and indeed proposed to the writer that he come to Akron to be the president of a research laboratory and chemical plant, offering a block of stock, and saying in his enthusiastic manner, "I will make you rich." As I then had visions of starting a rubber paper, I refused something for which perhaps the Goodrich company should tender me a vote of thanks.

It was not until a young chemist from Boston, through a reclaiming process that he invented, made a spectacular success for himself and for his company, followed by an equally spectacular success in extracting rubber from low-grade gums and making much more money for himself and for his company, that rubber manufacturers in the United States really awoke to the fact that the chemist could be anything besides a dreamer of dreams and a tester of the purity of compounding ingredients.

Looking at the rubber trade of the United States of today, it is absolutely impossible to even indicate how much chemists have done in rubber lines. Their work in producing reclaimed rubber of better types than ever before known, and in handling stock that at one time went under the furnace, is a matter of common knowledge. So, too, are the various extraction processes that have rendered resinous rubber, such as guayule and Pontianak, of so much value to the trade. Also, in the speeding up of the great variety of compounds by new and harmless accelerators, their work has been beyond praise. In the rearrangement of compounds, in the production of new and valuable ones, and above all in the testing of everything that goes into the factory and goes out of it, they have revolutionized the old rule-of-thumb methods. So true is this that every mill of any note today has either its own laboratory or leans hard on some outside consulting laboratory. Nor would any manufacturer today, once having employed chemists, think of doing without them any more than he would think of eliminating steam or electricity in his power plant.

It is a pity that time does not permit me to name the many eminent chemists—English, German, French and American—whose research work as set forth in books, pamphlets and essays constitutes some of the most valuable of the world's technical literature. Such a list, with an adequate description of the work done, would, however, far exceed the limits of this paper.

The fact being, then, that the chemist has not only established himself, but has practically taken over the industry that should have been his from the beginning, leads one to ask, "What of the future?" Are the problems all solved? To an imaginative man it doesn't seem that much more than a beginning has been made. The remembrance of the beginning of "Bakelite," a real competitor for hard rubber, and of the "Cravenette" process an equally real competitor of rubber clothing, is exceedingly suggestive. Rubber is and always will be an expensive commodity. It is individual in its extreme elasticity and resiliency. Why, then, where the plasticity of rubber is alone made use of, as in clothing, belting, packing, hose, matting and a score of other things, should not some other plastic, waterproof of course, dispossess it, and isn't the chemist the man who will doubtless accomplish that? That would give much more rubber for the millions of automobile tires that are in sight for the next few years. It would also leave sufficient rubber for thread, elastic bands, and goods for which no other plastic is fitted. There is a suggestion, also, of a rubber compound for footwear that will be waterproof from the outside and will allow insensible perspiration to work out from the inside. Why, too, as long as rubber sheets can be made absolutely inextensible, should they not be a compound for tires, to do away with the necessity for strengthening fabrics, either woven or cord?

Again, looking at the rubber processes from a distance, it seems a bit awkward that so much heat and pressure and expensive machinery should be needed to accomplish vulcanization. Why should not the chemist of the future add some substance to the rubber mass which in the course of a few hours will effect vulcanization without the application of heat? Were this possible, its value in colored rubber goods would probably be incalculable. If this compounding vulcanization did not darken the mass, how easy it would be to make hard rubber goods pure white—to rival and even surpass celluloid and "galalith" in all their gaudy colors. Or if the chemist finds himself unable to do this, let him recall the fact that in the East there is a rubber tree the latex of which, on coagulation, is bright blue. It is his privilege to discover what gives that particular color, and by applying it to the great orchards of the Far East, produce rubber of all the colors of the rainbow.

Coming down from the realms of imaginary triumphs to those directly before the chemist, there are in his own factory quite enough and more than he can intelligently solve in years to come—those are individual. For the trade at large there is the standardization of almost everything that goes into the mill and comes out of it, and then, for our own country's preparedness, the production of a cheap, high-grade, synthetic rubber.

The succeeding papers were confidential communications that will not be released until further experiment has been carried on and the results checked up. Owing to lack of space the rest of the essays will appear, however, in the November issue of THE INDIA RUBBER WORLD. An exceedingly interesting symposium, led by Dr. Geer and participated in by some 20 other rubber chemists, will also be treated at length in the November issue.

THE CHEMICAL EXPOSITION.

THE National Exposition of Chemical Industries was held at the Grand Central Palace during the week, and nearly two hundred displays filled the main floor and gallery of the great exhibition hall. Of these, comparatively few were specially devoted to the rubber industry, but those that were included several of the most striking variety.

By far the largest exhibit was that of the Buffalo Foundry & Machine Co., Buffalo, New York. This occupied the entire end of the main hall, and included an installation of "Bufllovak" apparatus—a 1,600-gallon nitrator for manufacturing nitro-benzol; a 2,500-gallon caustic box for making caustic soda; a 700-gallon sulphonorator; an 8-foot horizontal type evaporator; vacuum drum dryer in operation; vacuum surface condenser, two-stage vacuum pump; vacuum shell

dryer; fusion kettle, equipped with stirring device; autoclave, crystallizing pan and a fully equipped nitric acid plant. All these huge pieces of apparatus bore their names in bold lettering. Around the booth were transparencies showing photographs of apparatus made by this company.

J. P. Devine Co., manufacturer of vacuum dryers, Buffalo, New York, exhibited a complete installation of a double drum vacuum dryer, the first one built in America. This included, besides the dryer, a surface condenser and motor drive. It is especially designed for drying, in vacuo, viscous heavy liquors and pastes. Another notable feature of the exhibit was a high pressure cast steel autoclave built to withstand a pressure of 1,000 pounds to the square inch. The Devine nitrating kettle was another feature of the exhibit, as was also a series of photographs of various forms of dryers, etc.

The Werner & Pfleiderer Co., Saginaw, Michigan, had on exhibition a number of their kneading and mixing machines, including the rubber masticator for dry compounding, which was described in THE INDIA RUBBER WORLD of September 1. There was also shown a huge vacuum type "Universal" kneading and mixing machine with a heavy double agitator, and a copper bowl rapid dissolver, machines well known in rubber and chemical manufacturing circles.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, devoted its space mainly to an exhibit of controllers for electric motors. Among these was a Type F automatic control for alternating current motors, and a Type CS motor control.

The Bristol Co., Waterbury, Connecticut, showed recording instruments, including a recording thermometer for vulcanizers, an operation recorder for automobile tire presses which gives upon the traveling sheet 20 distinct operation records, and a new wet and dry bulb recording thermometer showing continuously the moisture content of the atmosphere.

E. I. Du Pont de Nemours & Co. and associated companies, including the Du Pont Chemical Works, Du Pont Fabrikoid Co., Fairfield Rubber Co. and The Arlington Co., had a very interesting exhibit of their products, including several chemicals used in the manufacture of rubber goods, their "Fabrikoid" for upholstery purposes, and rubberized cloth made at the Fairfield factory. There was also an exhibit of articles manufactured from "Pyralin," a substitute for hard rubber.

Another substitute for hard rubber, "Bakelite," was shown in the exhibit of the General Bakelite Co., New York City and Perth Amboy, New Jersey.

The exhibit of The J. H. Day Co., Cincinnati, Ohio, manufacturers of machinery used in mixing and compounding rubber, was most complete and interesting.

The Barrett Co., New York City, was well represented by a large and comprehensive exhibit, showing among other chemical products, toluol, benzol and carbolic acid, that are used by the rubber trade.

The Barber Asphalt Paving Co. had on exhibition among its asphalt products the "Genasco" mineral rubber, which is well known in the rubber trade. The Corn Products Refining Co., New York City, among other articles not used in the rubber trade, showed its well-known rubber substitute "Paragol," which is a sulphonated corn oil used as a filler.

The Luzerne Rubber Co., Trenton, New Jersey, exhibited hard rubber pipes and fittings, stop cocks, etc., for the conduction of acids, and also showed color boxes, photographic tanks, electrolytic cells, check ball valves and acid buckets.

Whitall Tatum Co., Millville, New Jersey, had an excellent exhibit of laboratory apparatus.

The exhibition was well patronized during every day and evening, not only by the members and guests of the American Chemical Society, but also by the general public. Moving pictures devoted to the exhibition of manufacturing and chemical engineering work were shown.

What the Rubber Chemists Are Doing.

THE STABILITY OF VULCANIZED RUBBER AND THE OPTIMUM CURE.

UNDER the above title Dr. Henry P. Stevens, in the "Journal of the Society of Chemical Industry" (August 31, 1916), presents the results of investigations made for the Rubber Growers' Association. The author remarks that in the manufacture of vulcanized goods the greatest care is taken to adjust the conditions of vulcanization to suit the particular compound to be vulcanized. Excess temperature or time will over-cure the product, and it will not age satisfactorily. Pronounced over-curing may exhibit inferior mechanical properties within a very short period of vulcanization, but in most cases the freshly vulcanized compound at first exhibits good mechanical properties, and it is only after a period of months or years that the over-curing becomes apparent by the gradual perishing of the rubber.

Pronounced under-curing also causes gradual deterioration, but the effect is not so marked as with over-cured rubber, and is more easily detected, as the mechanical properties of under-cured rubber are not fully developed.

It is obvious that for each particular rubber compound there must exist certain conditions of vulcanization, principally time and temperature, which will produce the optimum results. This cure has been termed the "optimum" or "perfect cure."

Schidrowitz and Eaton and Grantham have published their work on this subject. Each of these works was undertaken to compare the vulcanizing qualities of raw rubbers and to evolve a standard method of testing. These methods are based on the figures for tensile tests made on simple compounds of rubber with sulphur only, vulcanized for varying periods under constant conditions of temperature.

Eaton and Grantham say "we have always taken as the optimum, that point at which the product of the breaking load per unit cross section and the elongation is a maximum." Strictly speaking, they have taken the final length at rupture; that is, the elongation plus the original length, and multiplied this by the breaking load to give the product. This latter calculation appears to be the more correct.

The corresponding figure obtained by Dr. Stevens, termed "Tensile product," represents the breaking load per unit cross-sectional area of test piece, when the latter is fully stretched, as the volume of a piece of vulcanized rubber does not show appreciable alteration on deformation. The specimen giving the maximum product is held by Eaton and Grantham to be that which has been subjected to the optimum cure. It is obvious that if a number of vulcanizations be carried through with one compound for progressively increasing periods, some specimens may be under-cured, some over-cured and one will lie in the neighborhood of the correct cure, but it would be a mere chance if this last specimen were vulcanized for exactly the period required to produce the optimum effect.

These methods fail to take into consideration the fact that tensile properties of a vulcanized rubber are not constant, but vary with the age of the specimen.

Research work of recent years has shown that vulcanization proceeds after the actual vulcanization process is completed, and that vulcanization takes place, although very slowly, at the ordinary temperature of the air.

Dr. Stevens regards the vulcanization process as a sort of impulse, and the momentum induced carries on the vulcanizing effect after the vulcanization process is complete.

A specimen of vulcanized rubber, if tested at intervals of time over a given period, shows progressive changes during that period. Thus the product of the breaking strain and elongation of a specimen tested the day after vulcanization will usually give

figures which are lower than those obtained if the test be made a week or a month later. The term "optimum cure" if it is to have any practical meaning, must connote not only the physical properties of the freshly vulcanized rubber but also its aging.

There is another guide to correct curing, namely, the figure for the coefficient of vulcanization. With many types of compound this figure is difficult to ascertain, even approximately, but in a simple type, consisting entirely of rubber and sulphur, it is only necessary to extract exhaustively with acetone and to determine the sulphur in the residual rubber, expressing the results as a percentage of the raw rubber originally taken.

Dr. Stevens has carried through a comprehensive series of tests with the compound employed by Eaton and Grantham, composed of rubber with 10 per cent of sulphur. In each case the tests were carried out on the same lines as those of Eaton and Grantham, except that the vulcanized specimens were tested at intervals, the last test being put through approximately ten months after vulcanization. The rubbers employed were pale crepe and smoked sheet rubbers of ordinary commercial quality.

The results of the investigation prove conclusively that a rubber compound subjected to Eaton and Grantham's "optimum cure" is undoubtedly over-vulcanized, or over-cured, and that the word "optimum" is consequently incorrectly applied. If, however, Eaton and Grantham's definition be modified so as to include the aging factor, we have what appears to be a very good definition of the optimum or correct cure. It may be provisionally defined as that cure which gives the maximum figure for tensile product after full period of aging. It is not at present possible to define more exactly the period of aging. With rubber compounded with 10 per cent of sulphur only, the results show that the period should exceed the ten months allowed in the present experiments. Probably two or three years will be required. The vulcanized specimens must be preserved under suitable conditions and should not be exposed to light. It must not be forgotten that the temperature and possibly also hygrometric and other conditions of the atmosphere affect both the aging qualities and the physical tests.

The coefficient of vulcanization can only be taken as an approximate guide to the condition or degree of vulcanization. A figure for the coefficient exceeding 3.50 per cent for a vulcanized rubber and sulphur compound is an almost certain indication of over-curing.

ANILINE OIL POISONING.

In a communication to "The Journal of Industrial and Engineering Chemistry," W. W. Sanders relates the experience of the Goodyear Tire & Rubber Co., Akron, Ohio, with regard to its manufacture and use of aniline oil.

Since November, 1914, the company has manufactured about 1,500 tons of aniline, without a single fatality due to poisoning. This is the result of a persistent campaign to eliminate every possible source of danger and to care promptly for such cases of poisoning as have actually resulted. Men who are working constantly in the aniline plant and who have, in a measure, become immune to the effect of aniline vapor, show bluish lips and skin; the poisoning does not seem to go beyond that stage, and the men are not inconvenienced in any way. The severest cases have resulted from the spilling of aniline, nitrobenzol, or aniline hydrochloride directly upon the skin.

Realizing that poisoning may be caused either by inhalation of vapor or direct contact with liquid, the manufacturing precautions have been based on these two points. The building is provided with suction ventilating fans in the roof. Several 24-inch fans, located in the exterior side wall of the building, play

streams of air directly upon the men while they are at their operating positions. In fair weather the windows are removed, at other times satisfactory floor ventilation is provided. Suction ventilating ducts are led directly to stuffing boxes and iron boring feeders, where there is always more or less escaping vapor. The manufacturing system is closed, so that it is unnecessary for open aniline to be handled. Drinking men are excluded from the operating force. The men are provided by the company with regular rations of milk, with two clean working uniforms weekly per man, and with rubber boots. Shower baths are installed and their daily use insisted upon. Frequent inspection for leaks is made of pumps, valves and stuffing boxes.

The necessity of replacing the stirring paddles in the aniline reducers is the cause of many of the poisoning cases observed. In spite of continued washing and steaming out, there is sufficient aniline saturating the residual iron borings in the reducer bottom to make it inadvisable for men to remain in the reducer for more than a half hour.

METHODS OF ANALYSIS.

IN the article "Select Methods of Analysis of Golden Sulphide of Antimony" published in this department in August, credit was unintentionally omitted. It was condensed from the original in "Le Caoutchouc & la Gutta-Percha," by André Dubosc.

The following article is by the same author and also from the same publication:

SULPHIDES OF ANTIMONY AND THEIR ANALYSIS.

Golden sulphuret of antimony or pentasulphide of antimony is an important factor in the manufacture of inner tubes, druggists' and surgical rubber goods.

The pentasulphide is in non-stable equilibrium and under the increase of temperature, which occurs in the course of hot vulcanization, releases colloidal sulphur, which unites with rubber easier than flowers of sulphur.

This dissociation occurs at 130 to 135 degrees C., leaving as residuary product red trisulphide of antimony, a pigment, giving to the product the beautiful red color sought by the trade.

Red trisulphide under the same conditions, does not give the same results as the pentasulphide. It does not release the colloidal sulphur necessary for vulcanization. At 130 to 135 degrees C., it has a tendency to change into black sulphide. Instead of red goods, brownish unsightly products are obtained.

Under these conditions, one can realize the importance, from a practical standpoint, of knowing the trisulphide content of the golden sulphurets offered by dealers.

The manufacture of golden sulphuret of antimony is much more delicate than many imagine it to be and, even when starting from Schlippe's salts, very minute precautions must be taken to escape changing the pentasulphite or real golden sulphuret of antimony into the almost valueless trisulphide of antimony.

That is what many do not know and it explains the lack of value of some of the products found in the market.

Following are a few analyses of such products offered in the trade, which, in view of their composition, will not give complete satisfaction in vulcanizing.

GOLDEN SULPHURET A.

PENTASULPHIDE OF ANTIMONY.....	21.960%
TRISULPHIDE OF ANTIMONY.....	77.960%

GOLDEN SULPHURET B.

PENTASULPHIDE OF ANTIMONY.....	43.000%
TRISULPHIDE OF ANTIMONY.....	57.000%

GOLDEN SULPHURET C.

PENTASULPHIDE OF ANTIMONY.....	57.825%
TRISULPHIDE OF ANTIMONY.....	40.735%

GOLDEN SULPHURET D.

PENTASULPHIDE OF ANTIMONY.....	23.291%
TRISULPHIDE OF ANTIMONY.....	76.029%

Most of these products, owing to their high content of trisulphide, are only interesting as pigments; for, as vulcanizers, their reaction is very weak.

Such goods should be replaced by the types which contain lime sulphate as impurity, but in which all the antimony is in the form of pentasulphide as shown in the following analysis:

ANTIMONY SULPHIDE P No. 1.

PENTASULPHIDE OF ANTIMONY.....	64.692%
FREE SULPHUR.....	13.420%
LIME SULPHATE.....	9.852%
OXIDE OF ANTIMONY.....	12.046%

ANTIMONY SULPHIDE P No. 2.

PENTASULPHIDE OF ANTIMONY.....	56.998%
FREE SULPHUR.....	15.000%
LIME SULPHATE.....	28.002%

ANTIMONY SULPHIDE P No. 3.

PENTASULPHIDE OF ANTIMONY.....	68.099%
FREE SULPHUR.....	18.000%
LIME SULPHATE.....	13.901%

These products are perfectly manufactured. They were obtained starting from Schlippe's crystallized salt, and are precipitated by sulphuric acid. Their only impurity is lime sulphate.

With pentasulphides, like those of series P, the reduction does not extend to black sulphide, but stops at red sulphide, yielding colloidal sulphur, and therefore permitting (1) a more rapid vulcanization; (2) a perfect red and not a brownish coloring.

TOTAL SULPHUR IN RUBBER.

Davies' method consists in treating a half gram of finely ground vulcanized rubber in a 300 cc. Erlenmeyer flask with 15 cc. of saturated solution of arsenic acid, 10 cc. of fuming nitric acid and 3 cc. of saturated bromine water. The mixture is covered and boiled till oxidation is complete and the solution clear. If needed, more nitric acid may be added. The solution is evaporated to syrupy consistency, a few crystals of potassium chlorate added, and evaporation continued nearly to complete dryness, to expel entirely the oxides of nitrogen. After cooling, take up in 50 cc. of 10 per cent hydrochloric acid, heating over a water bath until solution is complete. The insoluble matter is separated by filtration and the filtrate diluted to 300 cc. from which the sulphate is precipitated in the usual manner.

The action of the arsenic acid is to raise the boiling point of the solution and to produce oxidation. The reagent is prepared by addition of arsenious anhydride to water till its boiling point is raised to 284 degrees F.

COLOPHONY IN SHELLAC.

A. Hutin in "Le Caoutchouc & la Gutta-Percha" discusses the adulteration of shellac and describes his methods for qualitative and quantitative determination of colophony which is a common addition for cheapening shellac.

QUALITATIVE TEST.—A gram of finely powdered gum lac is saponified with a slight excess of caustic soda, diluted with water and slight excess of copper sulphate solution added. If colophony is present resinates of copper is formed which will give a green color to turpentine. Pure gum lac under these conditions gives no indication.

QUANTITATIVE TESTS. (a) A gram of finely pulverized shellac is dissolved in 97 or 98 degree alcohol. Sand is added to form a mass and the whole evaporated to dryness on a water bath. The process of solution in alcohol, addition of sand and drying is performed three times to eliminate the gum lac, each time the mass being scraped from the dish. The gum lac and sand from these operations is extracted in a Soxhlet for four hours with chloroform. The colophony is dissolved, while the gum lac is not affected. (b) Add to one gram of finely powdered gum lac 50 cc. of 10 per cent borax solution. The gum lac will dissolve, but the colophony will not. Should the gum lac contain a phenol-formaldehyde condensation product as an adulterant, the latter would not dissolve in the

borax solution but would remain with the colophony present. Condensation products, as applied, would be insoluble in alcohol and acetone, in which they only swell. The colophony could be recognized in the alcoholic extract and determined. Before long gum lacs are likely to be adulterated by products similar to "Bakelite" when a method is found to produce an alcohol soluble form to meet the requirements of the consumer.

CHEMICAL PATENTS.

THE UNITED STATES.

SYNTHETIC CAOUTCHOUC. An improvement in the manufacture of synthetic caoutchouc from isoprene by polymerization, consisting in first polymerizing the isoprene and then adding to the polymerized product ethyl acetate in sufficient quantity to dissolve the caoutchouc-like substances which are not real caoutchouc and to precipitate the real caoutchouc. [Arthur Heinemann, West Kensington, London, England. United States patent No. 1,194,839.]

LIQUID COATING COMPOSITION. A composition of matter consisting of Pontianak gum copal, 90 pounds; shellac, 10 pounds; alcohol, 14 gallons, and benzol, 6 gallons. [Alfred R. Picker, assignor to Durlaque Manufacturing Co.—both of St. Louis, Missouri. United States patent No. 1,196,276.]

RECLAIMING RUBBER. Waste rubber scrap is treated in a bath made of sulphuric acid and an excess of calcium chloride, at a temperature below that of vulcanization; subsequent treatment with a solution of caustic alkali at a temperature below that of vulcanization; removing the alkali and plasticizing in highly heated water. [Harry O. Chute, New York City. United States patent No. 1,196,334.]

LABORATORY APPARATUS.

CONTINUOUS HOT WATER APPARATUS.

PROF. J. HOWARD ROOP, of Purdue University, describes in "The Chemist-Analyst" a novel apparatus for a continuous supply of hot distilled water for analytical work. The apparatus shown in the cut may be made by reversing the use of an ordinary worm condenser.

let O through a rubber tube to drain.

Connect the condenser C, and steam pipe by means of a piece of pressure tubing wired on at R. The outer jacket of the condenser forms for the worm bearing the distilled water. The top of the condenser is fitted with a three-hole rubber stopper and has running through it three glass tubes; D for the distilled water supply, A for air and S for a siphon.

The distilled water enters the worm tube through D and is drawn off at B by a length of rubber tubing; the flow being controlled by a pinch cock P. The tube at A allows air to enter and should extend a few inches above the siphon. The siphon carries off any extra water backing up in the worm, which can be caught in a bottle for distilled water. The outlet for the condensed steam escapes by the outlet O through a rubber tube to drain.

A NON-SPATTERING WASH BOTTLE.

To avoid spattering at the tip of the nozzle of the ordinary wash bottle, F. C. Clapp, of the Minnesota Agricultural Experiment Station, St. Paul, Minnesota, has utilized the principle of raising the water table of the wash bottle slightly above the level of the tip of the nozzle, thus avoiding "back action" by retaining the nozzle permanently full of water.

The diagram will make the principle clear. While the bottle is in use the thumb is held over the pressure release D, the water is forced up through the tube C till the water-table indicated has been reached, the water level being maintained by the stopper F. The nozzle works the same as though the wash bottle were full to the raised water level. Before releasing the pressure from the mouth piece the thumb is taken off the tube D so that the

height of the water-table A may be insured, and to prevent "back action" through B.

In construction the following details are important:

1. Make D 5 millimeters, or as large as possible, to afford a quick release of pressure, having it project only to the bottom of the small cork in A.
2. The size (4 millimeters) and length of B are not important except that the bottom projects an inch or so below the water-table.
3. The stopper F should be near the bottom of A for best results.
4. The tube A (12 millimeters) projects up through the stopper and to the bottom of the bottle.
5. The intake C should be 4 millimeters, or as small as possible, and still give sufficient flow. Its height determines the height of the water-table.

All dimensions given are outside measurements.

EXTENSION WEIGHING SCOOP.

A recent improvement is an aluminum weighing scoop, attachable by means of a bayonet joint to an extension. Samples can be weighed and introduced into flasks and narrow openings without transferring or getting any of the material on the sides of the flask or other receptacle. There are frequent occasions where the use of this little instrument is very desirable, as it not only prevents any loss of materials by placing the weighed sample precisely where wanted, but in this way obviates excessive use of reagent to wash adhering substance from the neck of narrow vessels. It is a great convenience in many determinations. [Scientific Materials Co., Pittsburgh, Pennsylvania.]

HYDROGEN SULPHIDE CONTAINER.

Ernst Richter has devised a container for hydrogen sulphide in the absence of a hood. It is described in "Chemical Abstracts" as follows: It is recommended that hydrogen sulphide water be filled into a small black-lacquered separatory funnel, the delivery tube (3cm. in length) of which is supplied with a perforated cork, so that the apparatus when not in use is closed by fitting a test tube on the cork. When it is desired to apply the reagent, the test tube is replaced by another containing the material to be tested.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

New Machines and Appliances.

RUBBER SHOE PATTERN ROOM.

MANY problems relating to style, fit, construction and economy of stock are involved in designing and making ready for the manufacture of a line of rubber boots or shoes. These problems come for solution to the pattern room. Such a room is shown in the illustration of the pattern department of the La Crosse Rubber Mills Co., La Crosse, Wisconsin. In addition to solving questions of design and construction, the pattern room furnishes the many sheet metal patterns needed by the factory in the manufacture of goods. These patterns are standardized and graded accurately to size and shape corresponding to the parts they represent in the shoe. The number of such patterns necessary in a factory is very large and subject to constant change and renewal.

Several features of pattern room work are clearly shown in the picture. On the drawing board in the foreground the pattern maker lays out a complete set of patterns for a middle size shoe, and cuts them from heavy paper. These serve as original

PATTERN ROOM IN A RUBBER SHOE FACTORY.

standards, and by means of a size-grading machine, seen in the background, they are reproduced in proper gradations for every size of shoe desired.

The graded sets of paper patterns are next transferred to sheet metal for use by the rubber cutters. This is accomplished by outlining the paper pattern on stout sheet tin and, by means of heavy, hand-operated bench shears, cutting the tin to the outline, as the operator in the foreground is doing. Careful size marking and filing is necessary to render the standard paper patterns always accessible, and provision for this may be seen in the various tools and furniture shown in the cut.

SOME GARVIN HARD RUBBER LATHES.

In the manufacture of fountain pen barrels and caps, pen and pencil holders, syringe and atomizer parts, electrical switch handles and many other hard rubber products, speed and turret lathes are important. In the illustration, Fig. 1, are shown two views of a 10-inch speed lathe commonly used in hard rubber mills for turning, threading and chasing. The bench lathe is shown in the first view with the combination cutting hob and leader that operates the chasing bar. In the second view the same machine is shown with floor legs and the chasing bar attachment removed. The lathe has hardened and ground spindles, running in conical-shaped solid bronze boxes and is provided

with a tight and loose pulley in the spindle. It is driven from a countershaft placed at the back of the lathe and connected to the main line.

The No. 2 screw cutting lathe, shown in Fig. 2, has a plain turret-head, automatic collet, a bar feed, and is very similar to

FIG. 1.—HARD RUBBER SPEED LATHE.

the No. 1 lathe, but is larger and capable of handling hard rubber rods up to 1 inch in diameter. It has tight and loose pulleys in the head instead of a cone pulley and the belt shifter is directly underneath the pulleys. The counter shaft is placed on a bench directly back of the machine which is driven by straight and cross belts.

Another interesting hard rubber turret lathe is furnished with short bench legs or floor legs as desired. This tool is designed to handle a greater variety and quantity of work than the lathes previously described. It has a power feed and an auto-

FIG. 2.—NO. 2 HARD RUBBER LATHE.

matic turret, automatic collet and bar feed for handling rubber rods up to $1\frac{1}{8}$ inches in diameter. The slide rest, besides having the hand lever operated cross motion, is provided with a sidewise swiveling movement. [The Garvin Machine Co., New York City.]

A CONVENIENT CEMENT CAN.

Receptacles and cans that are intended to hold inflammable mixtures should be designed with the idea of reducing the fire hazard to a minimum. Experience has proven that they must be made in such a way that their contents in case of fire will burn off slowly, confining the fire to the immediate vicinity instead of exploding and scattering the fire over a large area.

The illustration shows a cement can designed for a supply room and one which can easily be transferred to and from the cement house. It is constructed of heavy galvanized sheet metal with slanting bottom and a tight-fitting cover that prevents evaporation

and acts as a safety valve in case of fire. The quick closing gate valve saves time and reduces waste. The can is made in two sizes, holding approximately 5 and 10 gallons, respectively. [United Awl & Needle Co., West Medway, Massachusetts.]

THE MASTER CHRONOGRAPH.

Two of the principal causes that result in loss of profits to the rubber industry are loss of time and unnecessary motion. Careful investigation would doubtless bring to light in many plants the presence of leaks that are directly responsible for the failure to make goods at a profit.

The master chronograph is a specialized watch that is used as an aid in studying mechanical operations. The chronographic feature operates in seconds and fifths of seconds. The figures on the extreme outside of the dial are spaced one second apart and represent at any point of elapsed time exactly what the corresponding output or production per hour is, when the operation is of one minute's duration or less. The figures on the extreme inside of the dial,

such as 51, 45, 40, etc., represent operations per hour, when an operation goes past one minute and into the second minute. Between these figures one can easily scale the result. For instance: If it requires 29 seconds to perform one operation, as shown by the stopping of the large hand, the reading 124 directly under it is the corresponding output per hour.

If the hand is stopped over 19 seconds the reading directly under it shows the output to be 190 per hour.

Let us assume that the operation is of longer duration than one minute, that the large hand made one entire revolution and went on to ten seconds beyond, or one minute and ten seconds. The reading in that case would be 51 operations per hour, inasmuch as all figures for the second minute are placed on the extreme inside of the dial.

In the case of very short operations it is usually good practice to time ten operations and add a cipher to the amount shown on the computed dial.

Let us assume that it is desired to ascertain the number of

strokes per hour of a press or the production of an automatic machine, and while we count ten strokes or pieces, as the case may be, the hand reaches 19 seconds. Reading directly under it and adding one cipher, we have 1,900 as the number per hour.

For motion study and lost motion determination, rate standardization, general cost data and all other short time operations, this device is obviously useful. [Mortimer J. Silberberg, Chicago, Illinois.]

MACHINERY PATENTS.

PORTABLE RAG WRAPPING MACHINE.

THIS machine, designed for wrapped tread tires, provides a spider of novel form on which the tire remains from the time it is taken out of the mold, after the first cure, until the completion of the wrapping process and its removal for the final cure. Moreover, the machine is portable and self-contained, so

that it may be brought into action successively upon tires supported on different spiders.

In the drawing, *A* designates the base of the machine, the back of which rests upon legs *B*, while at its forward edge a pair of bars *C* are pivoted at *D*, the upper ends being connected by a handle *E*. When this is swung downwards the ends of the bars

are raised from the floor, and the machine is free to be moved about on rollers *F*.

The table *G*, supported by rods *H* and standards *I*, has a central opening above which is mounted on anti-friction rollers the annular gear *J*, provided with a hinged segment that admits the tire to the opening in the table. This annular gear is driven from the vertical shaft that is journaled in the frame and driven by the electric motor mounted on the base plate.

The fabric spool *K*, mounted on the annular gear, contains the wrapping strip *L*, that passes around the tension guide *M* to the tire *N*.

While the tire is being built up, the spider *O* acts as a core chuck, but in the wrapping operation it assists in rotating the core. The spider has three arms supporting the screws that adjust the three rollers *P* to the inner circumference of the tire by miter gearing located in the hub. Each roller is bushed and key-wayed to fit the short, splined stub of the portable jack shaft *Q* that is driven from the vertical shaft and rotates the tire.

In operation the hinged segment *K* is raised and the machine swung in position so that the tire enters the gap when the segment is closed. Then the jack shaft *Q* that transmits power from the vertical shaft to any one of the rollers *P* is connected up, and the machine placed in motion, whereby the tire is slowly revolved by the pulley *P*, and the strip of fabric *L* is spirally wrapped around the tire by the revolution of the horizontal gear *J*. [William C. Stevens, assignor to the Firestone Tire & Rubber Co.—both of Akron, Ohio. United States patent No. 1,194,565.]

MACHINE FOR MAKING AND COATING WEFTLESS FABRICS.

The method consists in using two parallel warps of threads of indefinite length, each warp having the width of the finished fabric, but each having a number of threads equal to half the

total number of threads in the finished fabric. The threads of each warp are inserted between threads of the other warps,

downward through the vertical comb E, which unites the two half warps in a single layer.

After passing around the roller F and between rollers G and H, where it is impregnated with rubber solution, the fabric is guided over the heated drum I, and the spreading device J applies a coating of rubber to the front surface. It then passes around the drum, over the water cooled roller K, and between rollers L and M to the spreader N, which rubberizes the back surface of the fabric.

The fabric, which is now coated on both sides, passes under the steam-heated hood O, and around the guide roller P to the wind up roller Q, the liner being supplied from roller R. The solvent vapors are drawn through pipe S by a suction pump to the chamber T, into which are also drawn vapors from the drum I. [Eugene Bourdin, Lyons, France. United States patent No. 1,195,554.]

MECHANICALLY OPERATED STRAINER HEAD.

To avoid difficulty and loss of time attendant in changing the strainers of rubber reclaiming machines when they become clogged, is the object of this invention. The accompanying drawing is a side elevation of a tubing machine showing one of the three mechanically operated strainers and the operating motor attached overhead.

The strainer head A discharges in three directions longitudinally and laterally, and is bolted to the tubing machine head, forming a continuation of the stock discharge passage. It is chambered for steam and provided with guideways in which the three strainers slide vertically. One of the side strainer heads is shown at B, and C is a side elevation of the front head. These are raised and lowered by screws, one being shown at D, that are turned by three splined gears located in the casing F and driven by a pinion and vertical shaft connected to the motor G. The individual movement of the screws is controlled by three levers, one of which is shown at H, each lever being provided with a pivoted link I, that automatically stops the movement of the strainers beyond a prescribed point.

The strainers are rectangular perforated plates in two sections that are removably held in the strainer frame, their perforations

registering with those of the frame plate and a wire mesh of finer gage, in two sections, interposed between. Thus the fine wire strainer is protected from injury by the larger particles of metal and other solids in the rubber and holds back the finer particles and shreds of fabric. When the strainers become clogged they are raised or lowered, as the case may be, until one of the sections clears the head and the other is opposite the outlet, then the clogged section and wire sheet are removed for cleaning without interrupting the operation of the machine. [Frederic B. Garrahan, Paterson, New Jersey. United States Patent No. 1,195,576.]

INNER TUBE ROLLING MACHINE

Generally speaking, inner tubes are made by hand, and therefore the following illustrated description of a new mechanical device for doing this work is of interest.

Referring to the drawing, which is a side elevation of the machine, the operation is briefly as follows: The pole A is placed on the endless belt carrier B, and the four narrow rollers, two of which are shown at C, C, are brought down in contact with the ends of the pole and supported by the idler roller D, located under the belt. The sheet of rubber stock is now laid on the platen E, which rests upon and moves with

the belt carrier. The upper edge of the sheet is then solutioned, the carrier belt placed in motion, and the platen and the superposed sheet of stock are carried into the machine to a point where the edge of the sheet becomes attached to the revolving pole upon which it is rolled up, the platen being checked in a position which imparts a slight tension to the sheet and delivers it smoothly and evenly to the pole. [Frank Fenton, assignor to the Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,197,192.]

TIRE BUILDING MACHINE WITH FABRIC STRETCHING DISKS.

The object of this invention in tire building machines is to apply a positive and predetermined stretch only to such points in the fabric strip where stretch is necessary to make the fabric conform to the shape of the core. Thus, longitudinal stretch in the margins of the fabric strip is eliminated, puckering obviated and the stitching operation reduced to a superficial rubbing.

The drawing is a side elevation of the machine showing a tire core A mounted and driven in the usual way. On the table will be seen the stock roll B, from which the frictioned fabric strips C are passed around an idler roller and then down and around the stretching drum D to the core, the liner being wound up on the roller E.

The stretching drum is made up of 11 disks of equal diameter, comprising annular rings and graduated friction surfaces, assembled side by side on the stationary shaft *I*. Each friction disk revolves on the shaft at a surface speed relative to the speed of a corresponding portion of the core. A pronounced drag is thereby produced on the middle of the fabric, the edges being free to travel unimpeded and the intervening portions are retarded to a degree corresponding to the drag produced by the friction disks over which that part of the fabric passes. Thus the fabric is built up on the core in a smooth and uniform manner. [George F. Fisher, assignor to the Hartford Rubber Works, Hartford, Connecticut. United States patent No. 1,195,800.]

A FRENCH PORTABLE REPAIR VULCANIZER.

This device comprises a casing *A*, which is trapezoidal in section, and made of aluminum or other metal. This casing is closed by a cover *B*, and constitutes the heating element for vulcanizing.

The cover can be flat, as shown in the drawing, or an arched or convex cover may be used.

The opening *C* is closed by a movable plate *D*, which is hinged to the casing and admits air to aid combustion. At the top of the casing there is a set of holes through which the products of combustion are exhausted.

The heater is made up of a hollow brass cylinder *E*, closed at one end, while the open end is closed by another cylinder of the same metal fitting over it. The cylinder is provided with a rectangular opening on its side, which is covered by a metallic screen, and, corresponding with this opening, there is a heart-shaped opening in the outer cylinder, constituting an aperture that is adjustable both lengthwise and transversely. This opening is the burner of the heater, and is also used for pouring the fuel into the heater. Inside of the cylinder there is a braid of asbestos or some other absorbent material. By turning the knob *F*, the length of the aperture and the width of the flame are regulated, thereby controlling the temperature of the vulcanizer.

The side of the casing is provided with two lugs *G* through which are passed two bolts that, in connection with iron washers and thumb screws, are used in clamping the object to be vulcanized between the wooden blocks *H* and the heating element. The temperature of the apparatus is measured by a thermometer that is not shown in the drawing. [Gauttieri and Cavaletti. French patent No. 480,124 (1915).]

PROCESS PATENTS.

MAKING CRINKLED RUBBER.

THE surface of crude rubber, when taken from the mill before being completely broken down, presents a wrinkled or puckered appearance, as will be seen in the accompanying illustration. After washing and drying, the ingredients are added and the stock milled carefully to permit breaking down. The crinkled sheet is then removed from the mill and cut into the required pattern for articles such as bathing slippers, wash cloths, handles for bicycles, etc.

After having received its final form the article is cured,

preferably by the cold process, to obviate the possibility of the stock softening and thereby losing its characteristic surface appearance. It is therefore better to effect the cure by dipping for a short time in a weak solution of sulphur monochloride. [Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut. British patent No. 100,727.]

METHOD AND APPARATUS FOR RECLAIMING. Rubber scrap of different densities is reduced to a pulp in water which is mixed with a heavy oil, and air is admitted to the bottom of the tank causing the particles of low specific gravity to rise to the surface with the oil, while the heavy particles settle. The film on the surface containing the lighter rubber is skimmed off by a slowly moving endless conveyor, while the heavier particles which settle are removed by the same means. [Thomas J. Pennington, Chicago, Illinois. United States patent No. 1,195,264.]

MISCELLANEOUS PATENTS.

CORD TIRE FABRIC.

A CORD fabric tube is built with two layers of rubberized cord, the inner layer laid at right angles to the axis of the tube, and the superposed layer comprising cords extending

from the tread line diagonally half way around the tube, and then diagonally back to the tread line. [John F. Ives, Cleveland, Ohio. United States patent No. 1,194,388.]

A similar patent

granted to the same inventor covers a two-ply fabric strip composed of two layers of rubberized cords, the inner layer extending at right angles to the edges, and the superposed layer extending diagonally from the center to the opposite edges of the strip. [John F. Ives, Cleveland, Ohio. United States patent No. 1,194,389.]

SAFETY PRESSURE GAGE

The inventor of this device has combined an air pump connection with a pressure gage that may be set to the required tire pressure, and when this point is reached the excess air escapes with a whistling sound. In the drawing, the upper is a sectional view and the lower one a side elevation of this device.

The gage being connected to the tire valve stem at A, the tube B is attached to the air supply, and the barrel C adjusted to the desired pressure on the scale shown in the lower figure. When this pressure is reached the air acts on the piston, comprising a tubular member D and an annular member E,

forcing back the spring F, and causing the valve G to move

away from the valve H. This allows the air to escape between them, and to flow through the opening I and the sleeve J, causing the whistle K to indicate that the desired pressure has been reached. [Frederick A. Schroeder, assignor to the Hill Pump Valve Co.—both of Chicago, Illinois. United States patent No. 1,196,142.]

TIRE PRESSURE INDICATOR.

In the accompanying illustration, the drawing on the left is a front elevation of this device, showing the valve and pressure indicating dial. Referring to the central drawing, the end of

the tire valve is attached at A, and the gage part B is forced down by hand to the position shown in the drawing on the right. Thus the stem C will unseat the pin in the valve, and air from the tire will pass upward around the stem, through the opening E and into the gage,

which will indicate the tire pressure on the dial. If additional air is required the manual pressure is removed from the dial and the air pressure raises the gage to the position shown in the central figure. Then air from the source of supply freely passes through the opening F into the central opening, and thence through the valve into the tire, the pressure being sufficient to unseat the valve. [James W. Frazier and Fred E. Hansen, Cleveland, Ohio. United States patent No. 1,196,226.]

GOLF BALL. This patent provides an inner rubber bag or container filled with liquids of different specific gravities, one of which is mercury. [William R. Knight, Belleville, assignor to St. Mungo Manufacturing Co., Newark—both in New Jersey. United States patent No. 1,194,751.] A similar patent granted to the same inventor was illustrated in THE INDIA RUBBER WORLD, September 1, 1916, page 662.

LEAK ALARM. A rubber bulb is made integral with the inside of the inner tube and provided with a whistle which gives an effective alarm when the tube becomes deflated to a predetermined extent. [George W. Wells, assignor to Walker-Wells Co.—both of Amesbury, Massachusetts. United States patent No. 1,195,883.]

THE UNITED KINGDOM.

RUBBER COVERED ROLLERS. Rollers of the cushion type with a metal core around which rubber tubing under fluid pressure is spirally wound and an outer sleeve applied and vulcanized, have been covered in British patent No. 2,606, 1915, by the inventor of the following patent. The present invention relates to means for preventing the spiral tubing from creeping endwise. [Jabez Musckett Pendleton, Manchester, England. British patent No. 15,001 (1915).]

HARD RUBBER STORAGE BATTERY SEPARATOR. A thin hard rubber separator is molded with longitudinal ribs on the sides between which are additional ribs formed on one or both sides of the separator, tapered, thickened portions being provided at the ends to obviate longitudinal breaks, and it is then finished by punching perforations in the thin portions. [The India Rubber Co., New York City. British patent No. 100,994.]

COATING PNEUMATIC TIRES. This device provides a circulation of air within the inner tube and through an outside tube so that the air within the tire will remain cool during travel. This is obtained by attaching an annular tube to the spokes of the wheel and connecting it to the inner tube of the tire, the air circulating freely between both tubes. [P. J. Cuddihy, Rutherford New Jersey. British patent No. 100,897.]

New Goods and Specialties.

RED RUBBER DOLLS

FOR years the toy buyers of America have looked to the German factories for amusement devices of all kinds. The war has stopped this trade and for the holidays this year

practically all toys will be of American make.

Among the novelties for the coming season are the clever Dutch dolls shown here.

These rubber toys are claimed to be the only red rubber toys made in America. Being made from solid red stock they will not peel as do some

veneered rubber toys. For this reason they are absolutely safe for children and may be put in the mouth and played with without chance of harm.

These dolls are made as boy and girl. The designs are live and attractive, the little figures standing sturdily on their feet, the base being substantial enough to form a good pedestal. [Davol Rubber Co., Providence, Rhode Island.]

RUBBER-INCASED DESK CLOCK.

In many factories the constant vibration of the machinery is communicated so strongly to the floors and furniture as to interfere with the accurate running of clocks. Sometimes the presence of electricity acts as a similar preventative. To overcome this the "Nojar" desk clock shown here has been perfected. The works are of a first class make of such clocks, but instead of a wood or metal case is one of heavy rubber, which insulates the works from electricity, and cushions them from the vibrations. The design is chaste, and

the clock is an appropriate fixture for workshop or office and is also a convenient timepiece for a traveler, as it can be carried in the bag or suitcase, without special packing. [Pennsylvania Rubber Co., Jeannette, Pennsylvania.]

TOOTH-BRUSH ATTACHMENT.

The recently patented tooth-brush attachment shown herewith consists of a small piece of rubber made to slip up over the handle, around the back, and up above the sides of the brush,

having a bead of about one-eighth of an inch approximately flush with the ends of the bristles. Its purposes are to massage the gums while the teeth are being brushed, to hold the water and powder within the bristles, and to prevent the back and sides of the hard portion of the brush from injuring the gums. If it is desired to carry the tooth-brush in the pocket or in a traveling bag, the bristles may be turned around so that the rubber

attachment acts as a protective covering. [Theodore R. Plank, Los Angeles, California.]

"RINEX" SOLES.

With the cost of sole leather reaching unparalleled heights, the demand for a substitute has been far reaching and imperative. One of the new comers in this field is the "Rinex" sole, which is claimed to have all the good qualities of leather soles and rubber

soles, with none of the objections of either. This sole is recommended for lightness, toughness, flexibility, comfort, and wearing qualities. It is composed largely of rubber, with other materials, which add to its efficacy. It is made in the various shapes and thicknesses required by the shoe manufacturer, and in black, white and tan colors. [The United States Rubber Co., New York City.]

DECORATED TOY BALLS.

Rubber balls as toys for children come in more and more attractive guise, to delight the eyes and hold the attention of their youthful owners. The inflated rubber balls here shown are coated in assorted solid colors with a "New Process Finish," which affords a bright glazed surface claimed not to check nor crack. Imprinted on both sides, in the same color or in a different color for each side, are various decorations, illustrating nursery rhymes, circus animals, baseball figures, etc. These balls are furnished in three diameters: 2 3/8, 2 1/2 and 3 1/2 inches. [The Faultless Rubber Co., Ashland, Ohio.]

STEEL ERASER FOR FOUNTAIN PEN.

A small steel knife or eraser attachment housed within the rubber cap of a fountain pen affords a handy device for scratching out ink marks from penned or typewritten records. It is also applicable to ink pencils, lead pencils, etc. To accommodate this attachment, no change is necessary in some fountain pen models

and but slight lengthening in others. A tubular plunger carrying the blade or knife is inserted in the cap, the movement of

this plunger to bring the knife out through a slot in the end of the cap, and back inside, being effected through a small pin projecting from a bayonet slot in the side of the cap. [W. E. Meadwell, Ithaca, New York.]

CUSHION RUBBER-SOLED CANVAS SHOE.

In this high-tensioned age the majority realize the importance of reducing or eliminating shocks to the nervous system, and a shoe sole that prevents shock in walking would rightly be considered a benefaction. In the "Aviator" sport and tennis shoe, here shown, a resilient cushion, comprising a filler of aerated or sponge rubber between the inner and outer soles of the shoe, serves as a shock absorber and heat insulator. The illustration shows a shoe cut through the center longitudinally, revealing the air-spaced rubber filler, which, it will be seen, is doubly thick at the heel, where the need of a shock absorber is greatest. This gives also an added springiness to the step, a real aid to pedestrianism, while for protracted gymnasium work on hardwood floors, "Aviator" shoes are said to produce less than half the fatigue ordinarily felt when wearing the usual sporting shoes. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

A FLEXIBLE COUPLING AND UNIVERSAL JOINT.

The old type of universal joint, while generally positive and effective, has its objectionable features. To overcome these and give one of uniform strength in every direction, and between all points, and to reduce shocks and give more elasticity, the Thermoid-Hardy Fabric Flexible Coupling has been evolved. The main features of this invention are two three-armed spiders, attached on opposite sides of a flexible disk, at alternate points. These disks are composed of frictioned Sea Island cotton fabric, three thicknesses of

which are built up to form the cushion. These are attached to the spiders by bolts and nuts, washers being provided to prevent tearing during adjustment. The strength of the superposed layers, their threads at different angles, combined with their flexibility, makes a coupling which is economical to assemble, eliminates back-lash, requires no lubrication, is not affected by water nor oil, prevents the transmission of shocks and sounds, and is frictionless. It has been adopted, or is being tested, by many prominent engineers and factories in this country and abroad. [Thermoid Rubber Co., Trenton, New Jersey.]

RUBBER-COATED ADHESIVE PLASTER.

Rubber in a plaster for surgical uses adds to its adhesiveness. A rubber-coated zinc oxide plaster which sticks and stays stuck, and which, besides its surgical use, can be used for repairing articles of glass, china, cloth, wood, rubber tires, hose, etc., is now put up in various widths and lengths, in attractive metal boxes. [Bauer & Black, Chicago, Illinois.]

HAT "SWEAT" BAND WITH RUBBER DISKS.

For purposes of ventilation it is necessary that some means be provided so that the inner band of a man's hat, known as the "sweat band," will not come in too close contact with the head. Some sweat bands contain projections which form corrugations, unpleasant in sensation and exerting injurious pressure on the head of the wearer. Also, they do not materially assist in maintaining the hat on the head.

In the improved method here shown, thin rubber disks, or buttons, are fitted into holes about the size of a 10-cent piece made in the leather band. These rubber buttons when inserted form a perfectly smooth surface, but each button has a flange which keeps it from coming through the band and a humped back which throws it forward when the hat comes in contact with the head. As it permits a comfortable, natural position of the hat and free passage of blood through the scalp, the headaches so apt to be produced by ill-fitting hats are avoided, and it is claimed also to prevent baldness. [Robert H. Holmes, New York City.]

GOODRICH RUBBER BLANKET AND APRON.

Many a good suit has been ruined when a motor ride is interrupted by accident or injury to the mechanism underneath the car, rendering necessary the "get out and get under" process cele-

brated in song, to discover and remedy the trouble. A rubber blanket which, unlike many others, is not at all cumbersome, but can be folded into a small, compact package and carried easily

under the car seat or in the tool box, is a suit saver, and perchance a life saver, if the ground be of a moist variety. This is also an excellent camping blanket, and, in fact, its uses are manifold and its disadvantages nil.

The rubber apron for garage workers, also illustrated, completely envelops the wearer from neck to heels, thus affording the thorough protection particularly desired when washing the cars. For the uncleanly operations of vulcanizing tires, repairing automobile parts, etc., this ample covering is also highly useful, and it is claimed to be made of an excellent grade of rubber. [The B. F. Goodrich Co., Akron, Ohio.]

STYLES IN WATERPROOF GARMENTS

The three silk and rubber wraps here illustrated show the transition from summer to winter styles. The fabric used for the first two garments, appropriately named after the water nymph "Undine," is the result of a newly patented Scotch

process, the material being specially dyed, treated and rubberized. The color combinations and patterns furnished in the "Undine" fabric are exceptional—hand some—plain colors in all the newest sport shades, as well as plaids, checks and stripes, the material being double faced or satin-faced, as desired for the individual garment.

The cape shown, in a wonderful shade of rose pink, the box-plaited collar, and the edging on the shoulder cape and around the lower edge, lending the softening, becoming touch sought by feminine buyers.

As the days grow colder and autumn winds begin to blow, a closer fitting wrap is

more in demand, and the coat, hat and bag shown in the lower

illustration form a most attractive fall outfit for walking or automobiling. [Lewis & Bettinson, New York City.]

A stunning model imported by the "Dry Goods Economist,"

also shown, may be suitably worn when the snow flies. The coat and hat are of blue rubber, trimmed with rows of stitching and seal fur.

THE "SILVERTOWN" VALISE-TENT

The illustration shows a rubber-proofed outfit of decided utility, intended primarily for the use of officers in active service. It is thoroughly practical and designed not only to keep out rain, but to be impermeable even when resting in a pool of water. The material is rubber-proofed on the outside, so there is no absorption of water and consequent increase in weight. The valise weighs only 14 pounds, has no loose parts to get misplaced or lost, and is an exceptionally portable contrivance. It has a piece of strong canvas underneath, which forms the covering for the valise when packed, and straps which are at-

tached to the canvas, eyelet holes being provided along the two sides for interlacing, if desired.

In two or three minutes it can be made into a comfortable tent, or it can be used as an ordinary ground sheet. The illustration shows the valise erected as a tent. The flap marked *A* is a continuation of the top and sides and, when extended, shields the opening from driving rain. The flap marked *B* is a continuation of the bottom and sides and can be raised so that no water can possibly enter through the opening. Inside may be seen the roomy pocket in which the kit may be placed and used as a pillow. The dimensions of the tent, when erected, not including extension flaps, are as follows: Length, 6 feet 6 inches; width, 2 feet 3 inches; height, at top end, 2 feet 3 inches. [The India Rubber, Gutta Percha & Telegraph Works Co., Limited, Silvertown, London, England.]

THE NEW CRAVENETTE FINISH

The Cravenette Co. of New York has recently entered the field of broad silks and silk mixed fabrics of every description, with an entirely new finish. It is called "Cravenette Finish" and imparts permanent water-resistant and spot-proof properties to the fiber of the silk, so that a garment is insured against the damaging effects of water.

The feature most interesting to the rubber trade is the application of this finish to the goods after they have been rubberized, including silks, crêpe de chînes, wool, cotton and all other single or double texture fabrics used in the manufacture of rubberized goods. Thus the exposed portions of the garment or article are rendered water-repellant and spot-proof; the linings of ladies' silk rubberized garments are therefore immune from water spotting and single or double texture raincoats of wool, or wool and cotton, will not become water soaked.

It is noteworthy that this finish in no way affects the rubber or the fabric and by reason of the added water-resistant qualities the fabric will last and the garment preserve its appearance for a much longer time than ordinarily. Moreover, if for any reason the seams should separate and water come in contact with the lining, it will be unnoticed as the absorption is prevented by the special finish.

The Cravenette Finish department of the Cravenette company is located at Mount Vernon, New York, where the factory capacity at the present time is about 3,000,000 yards per year.

FIRESTONE "GIANT" SOLID RUBBER TIRES.

There are certain conditions of service under which a single solid tire is superior to two tires fitted as twins on wheels of heavy motor trucks.

The Firestone Tire & Rubber Co., Akron, Ohio, is selling "Giant" single tread solid rubber tires in 8-inch, 10-inch and 12-inch sizes.

These massive single tread tires have deep grooves in the tread to provide against side-slipping and are said to be as near pneumatic resiliency as can be produced in solid tire form.

It is claimed that this construction gives a greatly increased rubber cushion under the load, with a saving in weight in rim parts. Their very appearance certainly suggests strength and durability.

It is understood that the 8-inch "Giant" is considered as an oversize for 4-inch and equal to 5-inch twin tires, the 10-inch being oversize for 5-inch and equal to 6-inch twins, while the 12-inch "Giant" is oversize for 6-inch and equal to 7-inch twins.

These large tires are said to present a great advantage in uniformity of wear. They adjust themselves to the unevennesses of the road, and are built with a broad base to insure better traction when the vehicle has a tendency to skid. The manufacturers anticipate that this form of tire will come rapidly into wider use. [Firestone Tire & Rubber Co., Akron, Ohio.]

THE FEAR-NAUGHT TUBELESS TIRE.

This is a tubeless pneumatic tire that seems to be immune from many of the troubles that threaten the pneumatic tire of ordinary construction. It is said to be proof against blow-outs, due to the sturdy character of the casing, and liability to puncture is greatly minimized by the unusual thickness of the tread. Moreover, should a puncture actually occur, the tire will continue to carry the load without rim cutting, as it is non-collapsible.

It is really a single tube tire divided in the center by an annular rib of rubber, forming two continuous air chambers that

are inflated through an air valve of the ordinary type that opens into both chambers. Only one-half of the air pressure required for an average tire is recommended for this one. It is without beads, attachment to the rim being made by eight threaded lugs that are vulcanized in the tire. These pass through the rim and when the nuts are tightened the tire is securely held in place against a rubber liner of annular

form that occupies the bead space in the rim. They are made in all sizes to fit clincher and quick demountable rims. The Department of Militia and Defence of Canada has tested these tires with the view of adopting them for military use. The prototype of this tire was illustrated and described in THE INDIA RUBBER WORLD, February 1, 1904. [Fear-Naught Tire Co., Paterson, New Jersey.]

THE DUCO PNEUMATIC TIRE GAGE.

This new English device possesses some novel advantages that will appeal at once to the motorist who realizes the importance of keeping his tires properly inflated. It is, in fact, a combined air pump connection and pressure gage.

It is used in the following manner: The wheel is turned so that the tire valve occupies the highest possible point, the valve stem, therefore, extending downward. The upper part of the device is then slipped over the stem and the air turned on. While the tire is being inflated the air does not come in contact at all with the gage. When it is desired to know if the tire is fully inflated, a valve is operated by pressing the button at the end

of the valve stem and the pressure of air in the tire is immediately shown by a hand that points to the figures on the dial gage, indicating the tire pressure. Upon removing the hand pressure from the button the air is at once diverted from the gage and passes directly into the tire. [Brown Brothers, London, England.]

METHOD OF DETERMINING AIR PRESSURE IN TIRES.

Many tires that pass on to the scrap heap are prematurely and needlessly worn out through under-inflation. The amount of air necessary to carry will depend upon the amount of work that is to be done and the load carried. The following method for determining the correct air pressure for different loads is suggested by the Fisk Rubber Co.:

The motorist should determine the load for each tire and regulate his air pressure to carry that load without injury to the tire. To do this, weigh front and rear of the loaded car separately, and divide by two, which will give the weight carried on each wheel.

Now that the weight of load carried by each wheel is known, determine the air pressure by using the factor given opposite the tire size to divide the amount of the load, the result being the pressure required:

3-inch tire.....	Divide weight of load by 8
3½-inch tire.....	Divide weight of load by 10
4-inch tire.....	Divide weight of load by 12
4½-inch tire.....	Divide weight of load by 14
5-inch tire.....	Divide weight of load by 16
5½-inch tire.....	Divide weight of load by 18

Example.—On a 4-inch tire you find the load to be 720 pounds. Refer to above table and note that on a 4-inch tire 12 is the factor: 720 pounds divided by 12 equals 60, therefore inflate the tire to 60 pounds air pressure.

As the load carried by the front tires is usually less than on the rear, by using the method as suggested, it will be determined that less air pressure is needed. The ideal load for the best all around results under average conditions is as follows:

3-inch tires.....	400 pounds
3½-inch tires.....	550 pounds
4-inch tires.....	735 pounds
4½-inch tires.....	960 pounds
5-inch tires.....	1,210 pounds
5½-inch tires.....	1,485 pounds

A load heavier than these figures may be carried, but the resulting pressure necessary to get good tire mileage is usually very hard on the car and its occupants. To obtain best results weigh car as suggested, divide any load by figure given and inflate to that amount; test air pressure at least once a week.

THE EDITOR'S BOOK TABLE.

SIERRA LEONE, ITS PEOPLE, PRODUCTS AND SECRET SOCIETIES. By H. Osman Newland, F. R. Hist. S., F. I. D. [John Bale, Sons & Danielsson, Limited, London, England.] 16mo, illustrated, 240 pages. Price 7s. 6d.]

THIS book is more than a guide book, for while it contains a large amount of information regarding Sierra Leone, it is also a personal narrative of the author's experiences during his travels in that country, which being told in a somewhat chatty way, imparts much of this information in a most entertaining style. One chapter is devoted to life on a rubber plantation, and as the author is director of the Peneiro Rubber Estates, Limited, he speaks from experience and with authority. According to the book, the estate visited covers about 3,500 acres, about 18 miles out, on the railroad which runs from Freetown into the interior. *Hevea* rubber has been planted, while *Manihot* or *Ceara* rubber trees were growing wild—the result of former plantings—when the present company took possession. Mr. Newland mentions also the *Castilloa* and the *Fontumia elastica*, explaining the comparative values of these as rubber producers, showing the way in which the latex is secured from the different varieties, and giving various hints valuable for prospective planters in equatorial Africa.

A postscript consisting of more than 40 pages, is contributed by H. Hamel Smith, editor of "Tropical Life," this being devoted mainly to practical planting notes for Sierra Leone and West Africa. Regarding the cultivation of the *Hevea Brasiliensis* he says, "Trees that have been planted are too young at present for me to be able to say definitely whether they will prove a commercial success. All I can say is that they are growing well." In Mr. Smith's postscript are directions for the laying out of an estate; an article on moisture conservation, and directions for cultivating cacao and ground nuts. This is followed by an appendix giving some laws for the guidance of traders. The publishers state that if there is sufficient demand, the book will be issued annually, or biennially, with amendments and additions to date, as the "Sierra Leone Year Book," and with it, a Who's Who section.

IMPORTER'S DIRECTORY OF THE NETHERLANDS EAST INDIES. Published by the Division of Industry and Commerce of the Department of Agriculture, Industry and Commerce, Buitenzorg, Java. [4to, 98 pages. Paper bound.]

It certainly shows that the Dutch Government in the East Indies appreciates the value of publicity to increase foreign trade, when it publishes a directory in English to furnish information to merchants and manufacturers who wish to open trade relations with the local tradesmen. The book is a valuable one, inasmuch as it gives, in well arranged and classified form, the names and addresses of mercantile houses in Borneo, Sumatra, Java, Celebes and the smaller islands of the Dutch East Indies. The rubber trade, of course, is well represented.

NEW TRADE PUBLICATIONS.

ON the cover of a 48-page vest pocket booklet issued by the Dominion Rubber System, the alliterative caption "Foot Facts" and the Dominion seal stand out prominently in red and white against a background printed to simulate leather. The booklet contains practical information concerning care of the feet and of rubber footwear, and the story of the discovery of rubber and its uses, written in an entertaining, popular style with humorous illustrations. There are various data regarding postage, population and other Canadian matters, tables of measurement, a calendar for 1916 to 1918, etc., interspersed with which are advertisements of Dominion rubber footwear, while a number of blank pages afford space for personal memoranda.

A little advertising card, which includes a blank for using as a post-card in ordering, is sent out by the M & M Manu-

facturing Co., Akron, Ohio, to describe its inner tube splicers, showing the construction of these little accessories for the tire repairer and the method of using them.

The Link-Belt Co., Chicago, Illinois, in its latest "Silent Chain Bulletin," calls special attention to its casings for silent chain drives, giving full description, with diagrams and photographs of the casings themselves, and the means taken to render them dust-tight, oil-tight and accident-proof, points of interest to users of power transmission.

The B. F. Goodrich Co., Akron, Ohio, is sending out a compact little pamphlet entitled "Supporting the Chief," to call attention to its various lines of fire hose, solid tires for fire trucks, pneumatic tires for fire chiefs' automobiles, and also firemen's coats and "Hi-Press" footwear. The booklet is one which will be appreciated by members of fire departments, not only because of the reading matter, but also for the fine illustrations of fire apparatus and firemen in action.

No. 2 of "Extra Service," a little paper published monthly for free distribution among employes of The Federal Rubber Co., Cudahy, Wisconsin, has been received. It contains news and gossip of the factory, pithy sayings and a large amount of bright matter, interesting to its readers.

We are in receipt of the first issue of "Miller Talk," a house organ which the Miller Rubber Co., Akron, Ohio, intends to publish monthly. This maiden number is an eight-page leaflet printed on smooth-finished buff paper. The title page is adorned with a picture of the Miller factory buildings and three broadly smiling cartoon figures with hands at ears, typifying the policy of the paper announced further down the page as "A big ear for all the gossip of the shop and a cheerful tongue to pass along the best of it." It is a friendly, chatty little sheet concerning the doings of Miller employes, with good illustrations, cartoons and jokes.

The motor tire price list of Wood-Milne, Limited, Preston, England, shows some handsome illustrations of new treads of these well-known, English tires; also a description and illustration of the Wood-Milne patent pump for inflating tires, a small, compact machine weighing but a few pounds and contained in a box about 5 by 12 inches. The book contains code words for ordering and full price lists of all the various sizes of tires, the American sizes being listed separately for convenience. A supplementary catalog gives a list of solid band tires made by the same company.

Henley's Telegraph Works Co., Limited, London, England, has sent out a new price list of electric cables and wires, insulated with vulcanized and unvulcanized india rubber. It is a comprehensive work of over 100 pages, giving full descriptions and specifications of the many lines of cables, bell wires and flexible cords, and jointing materials made by this concern. A description is given of the Henley wiring system, the method of running electric wires on the surfaces of walls, and other matter of interest to users of cables and electric conductors.

The India Rubber, Gutta Percha & Telegraph Works Co., Limited, London, England, has sent out various price lists in uniform size, that they may be secured in the convenient binder furnished by this company. There have recently been received from this concern individual price lists of mechanical and general rubber goods; rubber gloves, gauntlets and mitts; matting; vulcanized fiber; waterproof fabrics; confectionery molds; balata belting and cycle tires. Each of these is well printed, and in

most the various articles comprised are illustrated, these illustrations being mainly finely engraved half-tones, while many of the lists contain matter descriptive of the manufacture, quality and use of the articles. This company is also sending out small pamphlet price lists of its various lines of automobile and truck tires.

* * *

A new semi-monthly journal entitled "Aviation and Aeronautical Engineering" is now being published by the Gardner, Moffat Co., Inc., New York City. It is a handsomely illustrated and finely printed magazine, very largely devoted to the theoretical, technical and mechanical problems of aeronautics, and contains papers by well-known engineers in this comparatively new science. The technical editor is A. Klemm, A.C.G.I., B.Sc., S.M.; the managing editor, Herbert M. Williams, B.S., and the military editor, Philip J. Roosevelt. Undoubtedly this journal will fill a special niche, and will find a clientele of its own in the line of aviation.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[217.] Inquiry has been received for names of rubber brokers with offices at San Francisco, California, or Seattle, Washington.

[218.] The names of firms making tissue paper transfers for marking inner tubes are requested.

[219.] Manufacturers of inner tube skiving machines are sought.

[220.] Names of concerns specializing in the manufacture of aluminum cups used in tapping rubber are requested.

[221.] A request has been received for names of firms supplying Dichlorethylene.

[222.] We are in receipt of an inquiry for vulcanizing accelerators.

[223.] A correspondent wishes to know where he can secure cotton linters for use in rubber shoe soles, and the fluffy fibrous waste that results from buffing automobile tires.

[224.] A correspondent wishes to know where he can secure a copy of "Dives' Plain Talks on Rubber."

[225.] Addresses of concerns making ivory or celluloid parts for "pacifiers," also the gelatine or jelly filling, are requested.

[226.] We have been asked who manufactures the Grieve Inflatable Waistcoat.

[227.] Addresses are requested of rubber companies making a business of selling stock to manufacturers of automobile tires, calendered and ready for use.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in the Netherlands desires to communicate with American manufacturers and exporters of fancy rubber articles. Report No. 22,426.

A business man from Spain, now in the United States, wishes to enter into commercial relations with American manufacturers of rubber goods. Report No. 22,458.

DRAWBACK ALLOWANCES.

The following are the amounts and names of concerns to which the Treasury Department of the United States has paid drawback allowances on exported goods relating to rubber, manufactured in whole or in part from goods previously imported into this country:

COTTON WATERPROOF CLOTH: J. L. Multy Co., \$75.02; C. Stohns Sons, Inc., \$682.48; Blumenthal & Co., \$794.68, due \$72.17; Garner Print Works & Bleachery, due \$96.67; Rigby Waterproofing Co., \$2,885.05; Stowe & Woodward Co., due \$10.69.

WOOL WATERPROOF CLOTH: Commonwealth Manufacturing Co., \$1,093.40; Cravenette Co. of New York, \$5,087.79; Einstein Manufacturing Co., \$4,063.61; Firth & Foster, \$367.51; London Shrinking & Finishing Works, \$28.07; Manhattan Manufacturing Co., \$318.94; Julius Kallman Co., \$11.43; Bradford Dyeing Association, \$5.20; Kennedy & Britt, \$214.14.

JUDICIAL DECISIONS.

DICKSON & CO., LIMITED, vs. DEVITT. Messrs. Dickson & Co., Limited, were the agents in London of the Third Mile (Federated Malay States) Rubber Co., Limited, which had bought rubber washing machinery in England to be shipped to Singapore. On November 8, 1915, Messrs. Dickson instructed the defendant to "insure, marine and war risks, machinery to the value of £500 [\$2,433] despatched for shipment to-day per steamer 'Suwa Maru' or other steamers, London to Port Dickson." The defendant effected an insurance on the machinery against marine risks per "Suwa Maru" or steamers from London to Port Dickson, but by some mistake only effected an insurance on the machinery against war risks per "Suwa Maru." The machinery was not taken by the "Suwa Maru," but on December 9 was shipped in the "Yasaka Maru," which was torpedoed in the Mediterranean Sea, and the goods were lost. The plaintiffs were unable to recover on the policy against war risks because that policy only insured the goods per the "Suwa Maru." They therefore brought action against the insurance broker Devitt, alleging that through his negligence and breach of duty they had been unable to recover the loss of £500 under the policy, and they claimed that sum.

The British Court held that a client was entitled to rely on a broker carrying out his instructions to insure, and that the client was not, as between himself and the broker, bound to see whether those instructions had been carried out and to look at the documents himself. If the policy had been in accordance with their instructions the plaintiffs would have been covered, but as it was not in accordance with those instructions they were not covered, and, therefore, the loss must fall upon the defendant.

FABRIC FIRE HOSE CO. v. TOWN OF CADDO AND OTHERS. This was an action for material furnished to a municipal corporation. The Supreme Court of Oklahoma held that where a plaintiff sues upon a claim against a municipality for material furnished, and proves his contract and delivery of the material to the municipality, and that the debt therefor is due and unpaid, he makes a *prima facie* case, and the burden of the proof is then upon the municipality to establish that the debt was illegally contracted. [The Pacific Reporter, Vol. 158, page 350.]

CONSOLIDATED RUBBER TIRE CO. AND OTHERS v. DIAMOND RUBBER CO. OF NEW YORK. This case, relating to the Grant tire patent, was the subject of an article in THE INDIA RUBBER WORLD for May, 1916. The Circuit Court of Appeals, in New York City, held that where a defendant has deliberately and persistently infringed a patent, even after its validity was established, any doubts as to the amount of damages for which it is liable will be resolved against it. That, in finding an established license fee under a patent as a basis for computing damages for infringement, the law does not require that all license fees should have been for exactly the same amount at all times. Approximately \$210,000 damages were awarded to the plaintiffs. [The Federal Reporter, Vol. 232, pages 475, 508.]

A guarantee of 4,000 miles of service is now furnished with "Tyrian" tires, manufactured by the Tyer Rubber Co., Andover, Massachusetts, together with direct factory service to customers located near the factory. This company invites automobilists to visit the factory and inspect the manufacture of these tires.

Interesting Letters from Our Readers.

RUBBER AND THE BARKLEY BILL.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—The Barkley bill imposing penalties upon those who misbrand goods may have its merits. While it appears to be a drastic measure which would make amenable and probably hamper certain rubber manufacturers who employ the words "pure gum," "pure rubber" or "pure Para" to describe their products as well as those who claim that their goods are "all rubber," or "contain nothing but pure rubber," still its equity of principle cannot be denied. It is admittedly difficult to frame any law incapable of imposing hardship upon some one, and so with the Barkley bill, yet it will surely prove of greater potential benefit than injury to the rubber business as a whole, tending to eradicate extravagant, indefinite and false statement and leading the way toward an accurately descriptive nomenclature.

Every rubber expert knows that substances other than rubber itself are essential to the production of rubber articles of every sort, the gum being virtually useless in a pure state. Just as an alloy of copper and zinc gives us brass, having important characteristics not possessed by either constituent metal, so rubber compounds contain legitimate ingredients other than pure rubber which impart desirable qualities not inherent in the gum alone. There is nothing about this to conceal and business foresight should have counseled against the use of catch phrases that might seem to do so, whatever the actuating motive. Certainly the enactment of the proposed law will in no wise damage manufacturers of honest goods; their reputation and popularity of product cannot suffer as a result of truthful statement in their own or competing publicity.

The rubber business is by no means exceptional in that some of its nomenclature is misleading. The term "solid gold," for instance, intended primarily to distinguish between gold plate and metal of uniform consistency throughout, is well known to infer part alloy introduced in small proportion to increase the durability of jewelry, and in larger proportion to cheapen it. Almost invariably, though, the term is qualified by the marking 10k., 14k., 18k., etc. This informs the purchaser what he should receive and places the matter on a definite basis subject to expert analysis so that failure of jewelry to measure up to the indicated standard constitutes an actionable case of misrepresentation. By comparison the notably lax terms of the furniture trade seem obviously dissembling. "Mahogany," for example, means mahogany veneer, not "solid mahogany," according to common usage. This may be the truth, but it is not the whole truth. But furniture manufacturers are awaking to the necessity of reform, and with the aid of their trade papers are now attempting to abolish the misuse of the phrase "American quartered oak" as so frequently applied to furniture which is neither American in spirit nor quartered oak in fact.

It is chiefly against such flagrant misrepresentations that the war of truth in advertising is now being waged so assiduously by the Associated Advertising Clubs of the World. Business acumen calls upon every conscientious advertiser to lend his hearty support to this movement. Indeed, the time is at hand when it behooves the advertisers in every kind of industry to restrain by concerted action those who use the legitimate parlance of the trade falsely with fraudulent intent, and to purge the trade vocabulary of all inadequate terms, not only those inexact phrases which may mislead the public harmlessly, but those fine sounding yet indefinite phrases with which unscrupulous manufacturers may cloak a multitude of sins or take ad-

vantage of conscientious competitors in dealing with poorly informed persons.

Happily the primary object of the loose terms common to the rubber trade has not been to deceive, although in certain instances they may have been resorted to in an attempt to distinguish between honest goods and those containing adulterants or made with scrap rather than new rubber. For the most part they have been adopted in response to the spirit of the times and as a direct outgrowth of pure food laws and advertising campaigns and their effect upon other lines of goods. The mistake has been in ignoring the fundamental fact that all rubber products are fashioned out of rubber compounds rather than pure gum. To infer anything otherwise courts distrust among those hundreds of thousands of intelligent persons who know something about the making of rubber goods, even though in a very general way; also it is unfair to those conscientious manufacturers who prefer to tell the strict truth even if not the whole truth.

It might be argued that if any article has the desired appearance, serves the intended purpose and possesses reasonable durability it does not really matter whether it be composed of pure rubber or what not, but this is beside the question. The same might be said of a diamond ring. The purchaser is entitled to know what he is buying and to receive an article equivalent in value to the price paid. There is no adequate reason for any misleading statement about it whatever, whether it be made in good faith or otherwise. To countenance inaccurate descriptive phrases and permit them to become the so-called technical terms of the trade is a grave mistake that will eventually redound to the detriment of any business. Were rubber publicity of this character directed solely to the trade, the issue would not be of serious moment, but instead it makes its appeal to the public at large. And this explains its very existence, for addressing such inaccurate phrases to the trade would manifestly be an insult to expert knowledge.

Viewed from every angle the Barkley bill offers a potent instrument with which to accomplish much permanent good in the rubber business as well as elsewhere, and its enactment should be welcomed by progressive men of integrity and foresight who seek to build reputations for the future as well as fortunes for the present.

TRADE CRITIC.

OUTSIDE HELP FOR RUBBER MILL ENGINEERS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—The rubber industry, like any of the other great industries of modern development, has had to create its own tools and methods of manufacture, rather than find them ready made to hand. The mechanical engineer of the average plant is the hardest worked man in the whole outfit; at least it would seem so, and if you ask him he will probably admit it himself. Usually a machine shop of very elaborate proportions is attached to all important plants, and the production of special machinery suited to the needs of the plant is an important factor in its organization. Inventive ability and technical ability of all sorts are employed and liberally paid. A way must be found leading out of all kinds of difficulties. The success of the plant is largely dependent upon the ingenuity and resourcefulness of the engineers working in its mechanical department, assisted by a corps of able helpers, and having at their beck and call all kinds of apparatus and facilities for experiment.

Very little study or interest has been given to the troubles and problems of the mill engineer by the average machine shop, outside the walls of these plants, except in some few notable cases where independent machine shops doing general work have really taken a leading part in the production of improved machinery useful in the rubber industry. In the average case the mechanical engineer has the whole burden of the development of labor-saving machines. Machine builders as a rule have been content to follow, rather than lead, and have contributed very little towards the special equipment required in building up their industry. Cases where any creative work in the line of special machine design has been undertaken voluntarily and on the sole initiative of the outside shop, are unfortunately far too few.

The mill engineer welcomes assistance, and does everything to encourage it, but the average machine shop for general work waits to be told what to do and how to do it, rather than buck up and give the mill engineer a helping hand.

The doctrine of coöperation is the only sound one in industrial development. The average plant producing rubber goods is strong financially, and is willing to pay handsomely for the proper sort of coöperation from outside sources in solving its problems. When an industry devoted to the production of rubber goods is obliged practically to go into the machinery business, just so much of its energy, thought and genius as it bestows on the machinery business are lost to the rubber business. The machinery business is the business of machinists. Mechanical problems are naturally the problems with which the machinery business should cope, rather than leave their solution to the skill and ability of engineers in other lines.

Of course it is not possible for machine builders to foresee and to provide for all kinds of contingencies arising in the constantly varying requirements, and new requirements, in the production of rubber goods. It is not too much to ask, however, that a little more "pep" and "punch" be put into the efforts of machine designers outside of the rubber plants. It is not too much to expect the experienced machinery houses to bring out labor-saving machinery which would go the mill engineer "one better." The mill engineer is only too willing to pin a medal on the successful designer, and leave the honors to the machinery trade, if only he can get from it the help he needs and is willing to encourage liberally.

THE CAMERON MACHINE CO.

Brooklyn, New York, September 20, 1916.

[THE INDIA RUBBER WORLD has always made a point of encouraging coöperation between machine builders and the trades employing machinery. Its columns are always open to machine builders who have produced something useful to the rubber trade. In fact we write hundreds of letters each year inviting producers of new machines to bring them before the trade through our columns.

The products of the Cameron Machine Co. are cases in point. The Cameron principle, the "Score Cut," appealed to us at once and that is why we have so willingly given space to the various Cameron slitting machines. Although it is perhaps not necessary, we assure them, or any other producer of rubber working machines or devices, that our columns are open to them provided, of course, that their products are of value to the rubber trade.—THE EDITOR.]

RUBBER MEN JOIN QUESTION CLUB.

The Question Club is a unique and highly exclusive organization which carefully preserves the secret of its name, purposes, and qualifications for membership. Organized 12 years ago with five members, five new members have been added to the roll, each year since, in every case men of power in their respective callings. Two of the five enjoying the honor of election this year are Charles McCullough, of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, and William J. Lamb, of the Fisk Rubber Co., Chicopee Falls, Massachusetts.

FROM A RUSSIAN PRISON CAMP.

THAT THE INDIA RUBBER WORLD is considered the headquarters for all facts pertaining to the rubber industry was brought vividly to mind recently by the receipt of a postal card from a captured German soldier in a Russian prison camp. The card is here reproduced photographically, both the face and back. The face shows the address, and also the permit or "frank" (in Russian and French) to allow it to go through the mails free of postage because sent by a prisoner of war. The message on the back has been allowed to go forward, after the censor has erased the name of the firm, presumably a German one, and obliterated

Gorbatow, 15 Juni 1916

Vor Ausbruch des Krieges stand ich in Unterhandlung mit Hr. Geo. D. Levysohn, so einer der führenden Männer einer...
Ich wäre Ihnen nun dankbar, wenn Sie mir die Firma mitteilen wollten, da er in gehört. Ihre Ansprache kann ich Ihnen erst nach Beendigung des Krieges erwirken da ich jetzt Kriegsgefangener in Russland bin. Korrespondenz nur deutsch oder französisch erlaubt.
Hoheachtungsvoll
Max Hack
Boennoninny Maker. Jah. Topdamobekara. Zeuckaa Anmeka. Topdamobr. Russia.

A CENSORED POSTAL CARD FROM RUSSIA.

with dense black ink a portion of the address at the bottom. A translation of the message is as follows:

"Gorbatow, June 15, 1916. Prior to the outbreak of the war I was in communication with Mr. Geo. D. Levysohn, one of the executives of..... (erased by censor)..... I would be very thankful to you if you would inform me of the name of the firm with which he is now connected. I can compensate you for your trouble only after the end of the war, for I am now a war prisoner in Russia. Correspondence is only allowed in German and French. Respectfully yours, Max Hack. My address is (in Russian), Boennoninny Maker Jah, Topdamobekara, Zeuckaa Anmeka, Topdamobr, Russia."

The card is interesting as a side-light on the censorship of the mails since the war began.

Contract has been made for the first unit of the tire factory of the International India Rubber Corporation at South Bend, Indiana, mentioned in the July issue of THE INDIA RUBBER WORLD. The dimensions of the building will be 382 by 80 feet, and it will cover 28,700 square feet of floor space.

TENNIS SHOES FOR SUMMER OF 1917.

THE manufacturers of rubber soled, canvas upper footwear, variously designated as sneakers, tennis shoes, sport shoes, etc., and "Keds" (the new name), publish their price lists for the summer season early in the fall previous, generally about September 1. On that date the United States Rubber Co. sent out its net price list, as did also the Canadian Consolidated Rubber Co., Limited, and soon after most of the other manufacturers issued lists which closely approximated in prices those of the previously mentioned companies.

There had been some apprehension on the part of customers that the new prices would show a heavy advance. Crude rubber prices had changed somewhat from those of a year ago, although

APSLEY RUBBER CO.

the higher cost of Brazilian varieties was practically offset by lesser values for plantations. But practically every other material which entered into the manufacture of these shoes has enhanced in value, while labor costs are quite a little higher than a year ago. There was considerable surprise manifested, therefore, when the conservative advance in prices was noted; none of these over 10 cents a pair, some of them less, while a few were continued at the same prices as a year ago.

Last year several companies introduced lines of rubber-soled canvas shoes without the rubber foxing. These simulated welt-sewed shoes, and were generally designated as welts, or of "welt construction." The popularity of these lines has been such that the manufacturers are preparing for much larger sales the coming season. These shoes cost somewhat more to manufacture, and the prices range from 10 to 20 cents a pair more than similar shoes of the older construction.

There is a noticeable increase in the number of lines of shoes with full heels. Manufacturers have found it necessary to place stiffeners, of metal or fiber, in the shanks of these to insure against discomfort to the wearers.

In no particular has the improvement in

ROTARY OXFORD, WITH WELT AND FULL HEEL, WHITE DUCK AND WHITE SOLE. UNITED STATES RUBBER CO.

tennis lines been more manifest than in the matter of lasts. But a few years ago there was practically but one shape of toe. Now there are wide and narrow toes, straight and nature-shaped lasts, while the better fitting of the material to the lasts, and the addition of leather reinforcements of seams, make to-day's tennis lines as trim and stylish as the products of manufacturers of fine leather shoes.

A new name has been invented for this style of footwear. It is "Keds." This word is to be used in place of "tennis" or

"tennis shoes" by the United States Rubber Co., to identify its lines, in contradistinction with similar goods of other makes. This word is the keystone of a most comprehensive campaign of advertising to the consumer trade. Incidentally, it may be stated that the company will run a similar campaign to popularize its raincoats under the newly-coined word of "Raynsters."

The United States Rubber Co.'s catalog and price list of sporting and tennis shoes for the season of 1916-17 is a pamphlet of 36 pages showing in neat half-tones the many lines of canvas upper, rubber-soled shoes made by this company. Each page is devoted to a special line and is ornamented with a blue border having the word "Keds" at the top and a picture at the bottom appropriate to the line shown on the page. The changes in prices on United States Rubber Co.'s tennis goods are as follows:

*No advance.

The Apsley Rubber Co., Hudson, Massachusetts, sends out its net price list in a 24-page pamphlet with a four-color cover. The half-tone engravings of the various lines are excellently drawn and well printed, some of them being shown in appropriate colors. Among the novelties is a line of pumps and Oxfords made from a new fabric in brown and gray stripes. Another noticeable addition is a wading shoe having a pure gum suction sole and a high lacing, with bellows tongue. An "Auto" gymnasium shoe with high foxing is another addition to this popular line.

The Canadian Consolidated Rubber Co., Limited, Montreal, Canada, devotes its September issue of "Foot Prints" to a catalog of sport shoes. This is a larger catalog than those previously mentioned and contains a very comprehensive list of the various lines made by this company. The illustrations are well drawn and engraved, and show some novelties, among them the new "Aviator" shoe shown and described elsewhere in this issue. Another novelty is a lawn bowling shoe similar in design to a line made in England which was illustrated in the September number of THE INDIA RUBBER WORLD. This catalog includes a number of lines of bathing shoes, bathroom and boudoir slippers, etc.

* * *

The Miner Rubber Co., Limited, Montreal, Canada, also uses its monthly house organ as an outing shoe catalog, which is quite elaborate in its arrangement, each page embellished with a well drawn illustration in colors, appropriate to the line of shoes mentioned on the same page, the "Greyhound" trade-mark being printed in outline at the top and the brand, "Miner's Greyhounds," at the bottom. The various lines are shown in color and particular attention is called to the pneumatic heel styles, and the lines made by the pressure cure process. Among the new ideas shown are the "Educator" line for children, the "Tramper" balmoral with high foxing and wing tip, and the "Beach" balmoral of white canvas with a tan rubber sole and heel but with white rubber foxing.

RUBBER EXHIBITS AT FIRE ENGINEERS' CONVENTION.

In connection with the forty-fourth annual convention of the International Association of Fire Engineers, at Providence, Rhode Island, August 29 to 31, a fine exhibition of fire apparatus and appliances was shown in the Armory building, among which might be mentioned the hose manufactured by the Bi-Lateral Fire Hose Co., Chicago, Illinois, and the Fabric Fire Hose Co., New York City. The Bowers Rubber Works, San Francisco, California, had an interesting exhibit of its pneumatic reversible landing mat, recently illustrated in THE INDIA RUBBER WORLD; the Dayton Rubber Manufacturing Co., Dayton, Ohio, exhibited its airless tires for use on fire apparatus; the Globe Manufacturing Co., Pittsfield, New Hampshire, made a good display of waterproof clothing; the New England Truck Co., Fitchburg, Massachusetts, had on exhibition a chemical and hose car equipped with large Goodyear pneumatic tires, and the Sewell

THE RUBBER CLUB OF AMERICA, INC.

The Seventeenth Annual Banquet of The Rubber Club of America, Inc., will be held in New York City on Monday evening, January 8, 1917, in the Grand Ballroom of the Waldorf-Astoria. The unqualified success of the last banquet and the general assurance that the coming event will bring out a much larger attendance have resulted in preparations being made to accommodate the expected numbers. An attractive program has been arranged and speakers of national reputation will entertain and edify the members and guests present.

The Executive Committee met at the Union League Club, New York City, September 21. Those present were: Van H. Cartmell, who presided; George B. Hodgman, William E. Bruyn, Paul W. Litchfield, Frederic C. Hood, Henry C. Pearson, Sidney S. Meyers, attorney, and Harry S. Vorhis, secretary.

A special committee consisting of Messrs. Pearson, Bruyn, Meyers and Vorhis was appointed to take up with the Treasury Department the classification of Pontianak now dutiable at 10 per cent ad valorem.

The Banquet Committee was recommended to appoint district committees for Boston, Trenton, Akron, San Francisco and Montreal, that interest in the annual banquet be furthered.

The following firm and associate members were elected:

FIRM MEMBERS.

Gordon Tire & Rubber Co., Canton, Ohio
Representative—H. B. McMaster.
The Falls Rubber Co., Cuyahoga Falls, New York
Representative—W. J. O'Donnell.
Turner Vaughn & Taylor Co., Cuyahoga Falls, Ohio
Representative—S. H. Vaughn.
The Alliance Tire & Rubber Co., Alliance, Ohio
Representative—Milton Bejach.
Connecticut Cottons Co., Boston, Massachusetts
Representative—Harry L. Burrage.
Featheredge Rubber Co., Inc., Chicago, Illinois
Representative—B. B. Felix.

ASSOCIATE MEMBERS.

P. T. Jackson, Bay State Cotton Corporation, Boston, Mass.
The following transfer of firm membership was made: The B. & R. Rubber Co., North Brookfield, Massachusetts, to Quabaug Rubber Co., North Brookfield, Massachusetts. Representative, T. G. Richards.

The following transfers from associate to firm memberships

SALESMEN, AGENCY REPRESENTATIVES, AND FACTORY EXECUTIVES OF THE FAULTLESS RUBBER CO. AT A RECENT CONVENTION.

Cushion Wheel Co., Detroit, Michigan, showed one of its cushion wheels for fire apparatus with part of the side steel bands and rubber flanges removed to show the position of the soft rubber cushion between the inner wheel and the tire felly, giving a very clear idea of its construction. There were many other exhibits of interest.

were made: W. G. Ryckman, New York City, to W. G. Ryckman, New York City. Representative, W. G. Ryckman; George Watkinson, New York City, to Standard Emarex Co., New York City. Representative, George Watkinson.

Discussions and routine business followed, closing one of the most satisfactory meetings held by this committee.

NEW INCORPORATIONS.

Albany Rubber Tire Co., Inc., September 14 (New York), \$3,000. Jennie F. Hurd, Edward M. Hurd, M. O. O'Donnell—all of Albany, N. Y.

Auto Ball Cock Co., August 11 (New Jersey), \$125,000. Robert B. Barber and Jane Massey Barber, Hazleton, Pa.; William E. Massey and Mina R. Massey, 1001 Wesley avenue, Ocean City, N. J. Principal office, 421 Eighth street, Ocean City, N. J. To manufacture and deal in automatic plumbing supplies.

Chase National Import and Export Corporation, September 6 (New York), \$5,000. George H. Warrin, 478 Marion street; Albert E. Baker, 552 Forty-seventh street, and Leon Dalrymple, 162 Lefferts place—all in Brooklyn, N. Y. Principal office, 25 Beaver street, New York City. To deal in South American products, rubber, etc.

Chemical Pump & Valve Co., August 11 (New Jersey), \$30,000. Frank A. Warter and Emil Warter, Perth Amboy, and Fred Batzel, South Amboy—both in New Jersey. Principal office, 46 Commerce street, Perth Amboy, Middlesex County, N. J. To manufacture and deal in pumps, valves, and tanks.

Eagle-Picher Lead Co., September 2 (New Jersey), \$10,000. William Wood, Thomas J. McCoy, Alfred Burdsal, William C. Wood, and John Ritterhoff. Principal office in State of New Jersey is at Blanchard street, Newark. To manufacture and deal in lead and zinc products.

Elastic Braid & Lace Co., August 11 (Massachusetts), \$25,000. Charles M. Porter, 112 Boston avenue, Somerville; George Fick-eissen, 63 Reynolds avenue, Chelsea, and William E. Waterhouse, 46 Lake avenue, Melrose—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in elastic braid, laces, braided fabrics and similar products.

Fero's Lexington Store, Inc., September 22 (New York), \$10,000. James J. Fero, and William A. Miller, 792 Seventh avenue, and Alfred Hines, 1074 Lexington avenue—both in New York City. To deal in tires, auto supplies, etc.

Goodrich Auto Service Corporation, F. W., September 22 (New York), \$75,000. Frank W. Goodrich, 312 East Fifty-eighth street; Peter V. Hoyt, 745 St. Nicholas avenue, and Henry W. Showers, 15 Wall street—all in New York City. Tire and auto service station.

M. & L. Auto Co., Inc., The, August 10 (New Jersey), \$25,000. R. C. McIntosh (president and treasurer); Norman D. Laughlin (vice-president and secretary), and Silvia D. McIntosh (stockholder)—all of Plainfield, N. J. Principal office, 322 West Front street, Plainfield, N. J. To deal in automobiles, tires, oils and accessories.

Meyer Tire Duck Co., John H., September 11 (New Jersey), \$300,000. John T. Neff and Rollin G. Neff, 26 Beach street, East Orange, N. J., and Samuel C. Steinhardt, New Rochelle, N. Y. Principal office, 26 Beach street, East Orange, N. J. To manufacture and deal in cotton and other fabrics.

Mutual Tire & Rubber Co., August 22 (Delaware), \$1,000,000. E. E. Bishop, M. L. Gatchell, and I. M. Bristow—all of Wilmington, Delaware. Principal office, Corporation Registry Co., 900 Market street, Wilmington, Del. To manufacture and deal in tires for automobiles, motorcycles, bicycles, carriages, and vehicles of all kinds.

Newark Rubber Tire Co., Inc., September 6 (New Jersey), \$10,000. Harry J. Martin, 67 Cabinet street; William F. Rothlis-berger, 49 Osborne Terrace, and Joseph P. Dunn, 266 Halsey street—all in Newark, N. J. Principal office, Room 804, 810 Broad street, Newark, N. J. To deal in rubber tires, automobile supplies and accessories.

Northway & Christopher, Inc., September 14 (New York), \$5,000. George S. Northway, John H. Burke and Daniel J. Seubert—all of Syracuse, N. Y. Principal office, Syracuse, N. Y. To manufacture and deal in rubber goods, tires, etc.

Para Co., The, August 19 (New Jersey), \$10,000. Irving L. Wright, 918 Stuyvesant avenue; George W. Pearson, P. O. Box No. 444; S. Roy Heath, Fisher place, and Harold S. Maddock, 15 Atterbury avenue—all in Trenton, N. J. Principal office, 7 North Montgomery street, Trenton, N. J. To manufacture and deal in tires.

Peerless Tube Co., August 28 (New Jersey), \$50,000. Charles O. Geyer, W. F. Harding, and Lewis H. Condit, Jr.—all of 70 Locust avenue, Bloomfield, N. J. G. H. Neidlinger (president), C. R. Pitt (treasurer). Principal office, 70 Locust avenue, Bloomfield, N. J. To manufacture and deal in cement tubes, etc.

Phineas Jones & Co., May 15 (New Jersey), \$100,000. Henry P. Jones, Phineas Jones, and H. Percy Jones—all of 45 North Broad street, Newark, N. J. To manufacture and deal in tires, wheels, etc.

S. Schein & Sons, Inc., August 28 (New York), \$20,000. Joseph S. Schein, 816 East 176th street; Jacob M. Zinaman and Avel B. Silverman, 51 Chambers street—both in New York City. To deal in rubber, gutta percha, balata, etc.

Sioux City Tire & Manufacturing Co., August 30 (Iowa), \$220,000. C. F. Skirvin (president); John Nagle (treasurer), and Charles F. Sawyer (secretary)—all of Sioux City, Iowa. Principal office, 607-609 Trimble Block, Sioux City, Iowa. To manufacture rubber goods, automobile tires, etc.

Tire Company of California, Inc., September 20 (New York), \$7,500. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, N. Y. To manufacture auto tires, etc.

Triple Tread Tire Co., August 10 (Illinois), \$500,000. H. G. Lund (president), 4720 Dorchester avenue; M. Lund (secretary), 7219 South Park avenue, and Edward Grunich—all of Chicago, Illinois. Principal office, 1545 Michigan avenue, Chicago, Illinois. To manufacture and deal in tires, inner tubes, etc.

Vulcanized Rubber Co., June 20 (Maine), \$1,500,000. Alfred F. Jones (president); T. L. Croteau (treasurer), and James E. Manter (clerk)—all of Portland, Maine. To manufacture and deal in crude rubber, lumber, merchandise, etc.

Washington Rubber Products Manufacturing Co., Inc., August 29 (New York), \$5,000. Henry Siegel, Abraham S. Gussew and Alexander Meyer—all of 5 Beekman street, New York City. To manufacture rubber goods, especially bathing caps, folding bags, auto tops, etc.

BERLIN RUBBER CO. CHANGES ITS NAME.

By order of the council, the name of Berlin, Ontario, Canada, was changed to Kitchener, September 1. The Berlin Rubber Manufacturing Co., Limited, its leading industry, in accordance with the above change, has renamed the corporation, and is to be known hereafter as the Kitchener Rubber Manufacturing Co., Limited.

MAPLE LEAF TO BUILD.

Maple Leaf Tires, Limited, Toronto, Canada, has begun the erection of a new plant at Belleville, Ontario. The property was originally part of the Yeoman's estate and contains approximately 23 acres. The main building will be 281 feet long and the width throughout 62 feet, with two large extensions or wings to the northward making the total width 125 feet. Several subordinate buildings will also be constructed as speedily as possible. The factory will be equipped with the best modern machinery obtainable, every comfort for the workmen being considered. The approximate cost will be \$100,000 and employment will be given at the start to about 100 hands. The company expects to manufacture 250 tires daily and many other rubber products, such as belting, garden and water hose, shoe soles and heels, rubber bottles, etc.

News of the American Rubber Trade.

BRIGHTON MILLS BUILDS NEW PLANT.

IN connection with plans for increasing its product, the Brighton Mills, Passaic, New Jersey, large manufacturer of tire fabrics for the rubber trade, has purchased about 300 acres of land at Allwood, New Jersey, which is within a mile of the present plant. Nearly 50 acres of this property, which is located on the Newark branch of the Erie Railroad, about midway between Newark and Paterson, will be reserved for factory purposes, and the balance will be developed into homes for the employees. Building operations have just started.

It is planned to increase the total output by approximately 30 per cent. The machinery to be installed was ordered months ago, and it is confidently expected that the new plant will begin turning out tire fabric in January.

John Nolan has been engaged to plan out the streets and landscape effects. Morris Knowles, of Pittsburgh, Pennsylvania, will supervise the sanitary installations. The John W. Ferguson Co., Paterson, New Jersey, will be the builders, and Murphy & Dana, of New York City, have been engaged as architects for the houses.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on September 25, are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new)	64½	65½
Firestone Tire & Rubber Co., common.....	1050	1080
Firestone Tire & Rubber Co., preferred.....	110	112
The B. F. Goodrich Co., common.....	72¼	72½
The B. F. Goodrich Co., preferred.....	112	114
Goodyear Tire & Rubber Co., common.....	270	290
Goodyear Tire & Rubber Co., preferred.....	106½	108½
Kelly-Springfield Tire Co., common.....	83	83½
Kelly-Springfield Tire Co., 1st preferred.....	98	100
Miller Rubber Co., common.....	250	275
Miller Rubber Co., preferred.....	104	106
Portage Rubber Co., common.....	160	170
Portage Rubber Co., preferred.....	160	170
Swinehart Tire & Rubber Co.....	90	96
United States Rubber Co., common.....	59	59¼
United States Rubber Co., preferred.....	113	114

RUBBER COMPANY DIVIDENDS.

The Rubber Goods Manufacturing Co. paid its 70th regular quarterly dividend of 1¼ per cent on the preferred stock on September 15 to stockholders of record September 12.

A 2½ per cent dividend on common stock and a 1¼ per cent dividend on preferred stock has been declared by the Portage Rubber Co., the common stock dividend payable November 15 to stockholders of record November 3, and the dividend on preferred payable October 1 to stockholders of record September 20.

A quarterly dividend of 1½ per cent on the preferred stock of the Kelly-Springfield Tire Co. has been declared, payable October 2 to stockholders of record September 15.

PROPOSED FISK INCREASE.

Stockholders of the Fisk Rubber Co., Chicopee Falls, Massachusetts, have been called to meet on October 2 to vote on increasing the capital stock by \$12,500,000. Of the new stock, \$7,500,000 would be first preferred convertible, and \$5,000,000 second preferred. At the same time the stock-

holders will vote on increasing the common stock by an amount sufficient to take care of the conversion of the present outstanding second preferred stock, and the proposed new preferred issues. The adjustment of Fisk stocks is to be completed by reducing the amount of the authorized capital stock by \$5,000,000, the amount of second preferred stock. Series B, authorized a few months ago but not issued.

STANDARD TIRE COMPANY FORGES AHEAD.

C. P. SMITH.

Charles P. Smith, newly appointed sales manager of the Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio, reports an increase in the company's business in the last six months of 650 per cent. The plant is running day and night, with three shifts, and enlargements are being made, and machinery and equipment ordered, which will give a capacity of about 600 tires daily. The Standard company has recently put on the market a new tire called the "Velvetread."

"RUB-HIDE" IN RUBBER.

A marked tendency in the compounding of india rubber today is a lessened use of inorganic and an increased use of organic fillers. While we hold no brief for the Henderson Rubber Co., Baltimore, Maryland, the notable increase in its business, as shown by the addition to the plant, would seem to prove that "Rub-Hide" was finding a place in the rubber trade. This substance, made from raw hide according to rubber manufacturers, possesses the following virtues: It adds notably to the tensile strength while giving practically the same elongation; it has no deteriorating effect, but rather is a preservative. That it stands the heat as in vulcanization is shown by the fact that it is used not only in soft rubber goods such as tires, inner tubes, and mechanicals, but in hard rubber as well. From 25 to 33 per cent is used in ordinary compounding.

WATER-CURED RUBBER GOODS.

The S. & W. Rubber Manufacturing Co., College Point, New York, is about to put on the market a new line of inner tubes, called "Velvet Water Cured" tubes. These goods will be, as the trade-mark indicates, cured in hot water; they will be produced in two colors, gray and non-blooming bright red.

Water-curing is not new, as quantities of hard rubber goods are thus cured. As far as soft rubber goes, the process is rarely used and certain mechanical difficulties being overcome, offers advantages—for example, water-cured goods are not likely to be overcured or "burned."

The company is also about to put on the market, tire casings, dress shields, elastic bands, bathing caps, jar rings, packing, etc., all water-cured.

The process is a product of the veteran inventor and experimenter in rubber goods, Arthur C. Squires.

PERSONAL MENTION.

Colonel Samuel P. Colt, president of the United States Rubber Co., New York City, has returned from an extended motor trip which included visits to the Canadian plants affiliated with the company.

The Pan American Society of the United States held a largely attended informal luncheon on September 11 in honor of His Excellency, Dr. Lauro Severiano Müller, Minister of Foreign Relations of Brazil, who sailed the next day for South America.

Frank Poel, formerly of the crude rubber importing firm of Poel & Arnold, returned from Europe the middle of last month.

Jose Sura da Costa, of Rio de Janeiro, Brazil, inventor of the Da Costa coagulating machine, is now visiting in New York City.

H. Stuart Hotchkiss, vice-president of the General Rubber Co., New York City, who is now in Sumatra, is expected to return next month.

Raymond B. Price, vice-president of the United States Rubber Co., who is at present in Europe, is expected to arrive home in November.

George Wilson has been appointed transportation manager of the Dominion Rubber System, with headquarters at the Canadian Consolidated Rubber Co., Limited, Montreal, Canada.

David S. Shearman, president of the Oldtown Rubber Co., Xenia, Ohio, is an heir of the estate of Mrs. Hetty Green, being a direct descendant of Sylvia Ann Howland, Mrs. Green's aunt, who left a trust fund of about \$2,500,000. Mr. Shearman and his five brothers will receive the share from the Howland estate, which would have been the portion of their father, who died in 1895.

Charles H. Roth, formerly vice-president and sales manager of the American Tire & Rubber Co., has been engaged as sales manager of the newly organized Iowa Rubber Tire Co., Bettendorf, Iowa.

Arthur Jackson Willis, whose portrait and biographical sketch appeared in the September 1 INDIA RUBBER WORLD, writes that a misstatement appeared therein, as he is not a graduate of Stevens Institute of Technology, although he attended that institution.

Harry L. Miller has been made manager of the Fisk Co. of Texas, at San Antonio, Texas, and was also elected secretary and a director of the company.

W. M. Doucette succeeds E. P. White as manager of the New York City branch of the Portage Rubber Co., at 1924 Broadway.

Clarence R. Bollinger has been appointed an adjuster of the Goodyear Tire & Rubber Co., Akron, Ohio, and will take charge of that department in the Goodyear branch at Buenos Aires, Argentina.

G. B. Overcynder, Rotterdam, Holland, managing director Surinam Balata Co., passed through New York last week on his way to Paramaribo, British Guiana.

G. A. PIRELLI IN NEW YORK.

G. A. Pirelli, of the well-known firm of Pirelli & Co., Milan, Italy, was in New York last month on business for his company. He reports unprecedented activity in the various plants controlled by the Pirelli interests, due to the large government and domestic orders. Building extensions and new plants are being erected to meet the requirements of the increasing business.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

NEW "USRUBCO" PURCHASING AGENT.

RAYMOND S. WILLIS, who has just been appointed purchasing agent of the United States Rubber Co., New York City, brings to this position a broad and varied business experience. He was a member of the class of 1898 in the Massachusetts

RAYMOND S. WILLIS.

Institute of Technology. On leaving this institution at the end of his junior year, he went ranching in Texas, Arizona and New Mexico. In 1900 he went to Mexico, where he became interested in rubber. From 1908 to 1910 he was connected in an executive capacity with the National Paper & Type Co.'s office in Mexico City. In 1911 Mr. Willis became secretary and purchasing agent in Barcelona, Spain, for the Barcelona Traction, Light & Power Co. This work was under the direction of the Pearson Engineering Corporation, Limited, New York City, which had previously built street railways in Mexico City and Rio Janeiro, and had charge of the engineering work of the Mexico Northwestern Railroad. Naturally, in connection with a project of this size, Mr. Willis had many invaluable experiences, and his work as purchasing agent in Spain opened his eyes to the possibilities afforded by the war for the extension of American markets. Consequently Mr. Willis resigned from the Barcelona Traction, Light & Power Co. to open his own export office in New York City.

Mr. Willis has been remarkably successful here and still retains an interest in the export business, although his entire time in the future will be devoted to his duties as purchasing agent for the United States Rubber Co.

SON OF A RUBBER ENGINEER.

Joseph A. Dennison, who, with his wife was lost in the mountain wilderness of New Hampshire, and rescued in an exhausted condition by a search party, was the son of John Dennison, for many years engineer at the works of the Tyer Rubber Co., Andover, Massachusetts. Several of the old engineer's children, too, found employment in the factory, while they were building up the family fortunes and getting the wherewithal to pay for their education. Joseph A. Dennison is a prominent and successful lawyer, a self-made man. After attending the public schools and Phillips Academy in Andover, he went to Dartmouth College, but left to take up newspaper work in Boston, Massachusetts, meanwhile studying law, and later graduating from Boston University Law School. He was Assistant District Attorney in Boston in 1905-1906, resigning in the latter year and resuming his law practice. Both Mr. and Mrs. Dennison are recuperating from the exhaustion caused by exposure and hunger during their wanderings in the trackless forest. A somewhat pathetic incident connected with this misadventure was the detention in Concord, New Hampshire, several days afterward of two Massachusetts boys who ran away from home to search for the Dennisons, hoping to secure the reward offered. They had not heard of the rescue of the missing couple.

TRADE NOTES.

Concerning the item of news of the Wilson Rubber Co., Canton, Ohio, which appeared in the September issue of THE INDIA RUBBER WORLD, it should be noted that the Wilson company has leased the plant formerly occupied by the Canton Manufacturing Co., and not that of the Canton Rubber Co., as was stated in the above mentioned paragraph. The Canton Rubber Co. is still located in the same factory building in Canton as heretofore, and is in no way connected with the Wilson Rubber Co.

The Republic Rubber Co., Youngstown, Ohio, is planning for additions which will include one new building and the remodeling of one of the existing buildings. Mills, calenders, boilers and various machinery will also be added, which will more than double the company's capacity in its pneumatic tire department, as well as considerably increase its capacity in other departments.

William H. Stiles, crude rubber importer and broker, has removed his office to 79-85 Wall street, New York City.

A. G. Spalding & Bros., manufacturers of sporting goods, have removed to the six-story building at 523 Fifth avenue, New York City, which has been completely remodeled to fill the requirements of their business.

The Falls Rubber Co., Cuyahoga Falls, Ohio, has removed its Cleveland, Ohio, branch from 2001 to 1844 Euclid avenue.

Among the wide range of exhibits at the Canadian National Exhibition at Toronto was that of the Dunlop Tire & Rubber Goods Co., Limited, showing an extensive line of mechanical goods and an interesting presentation of its popular rubber heels. Gutta Percha & Rubber, Limited, also made a creditable showing of military rubbers, lumbermen's rubber boots, leather tops, plain overs, croquets, tennis and sporting shoes and other offerings in the rubber footwear line.

The New York City office of the Boomer & Boschert Press Co. is now located at 25 West Broadway, Room 27.

H. B. Niblette, manager of the New York City branch of the Rubber Products Co., Barberton, Ohio, announces that this office is now settled at its new location, 148 West Sixty-eighth street, just west of Broadway.

The Electric Hose & Rubber Co., Wilmington, Delaware, will shortly erect a new one-story machine shop, 40 by 100 feet, to cost about \$11,000.

The Lycoming Rubber Co., Lycoming, Pennsylvania, employs more than 500 persons, and now has a daily capacity of 5,000 pairs of rubber shoes.

The new steel and concrete building of the National Rubber Co., Pottstown, Pennsylvania, is practically completed. The company recently declared its first quarterly dividend of 2 per cent.

A certificate of increase in the capital stock of the Stungo Radium Rubber Co., Pittsburgh, Pennsylvania, has been filed with the State Department at Dover, Delaware, increasing the capital from \$1,000,000 to \$3,000,000.

W. H. Jones, Southern selling agent for the United States Rubber Co., with headquarters at Baltimore, Maryland, was recently elected temporary chairman of the branch organization of The Rubber Club of America, Inc., lately effected at a meeting held at the Hotel Belvedere, Baltimore.

The net earnings of the United States Rubber Co., New York City, for six months, from January 1 to June 30, 1916, after deducting all interest charges, were \$4,920,649.80.

It is stated that an eastern syndicate has arranged to take over a large ranch in the vicinity of Redlands, California, for the planting of guayule and the erection of a factory for extraction of the rubber from the plant. The proposed enterprise will require an outlay of about \$1,000,000 and the employment

of at least a thousand men. It is said that about 70 beds or 2,000,000 plants have already been set out.

On account of the high prices of materials, the shoe repairers in various parts of Canada have formed local associations in the larger cities of Canada for the purpose of establishing uniform rates for repair work. It is noted that in St. Catherines, soling men's rubber boots is priced at \$1.85, while in Welland \$1.50 is charged for similar repair. Attaching rubber heels on men's boots is established at 50 cents (including cost of the heels) in all of the various cities, but for women's rubber heels, attached, the charges vary from 40 to 50 cents in the different localities.

The board of directors of the Kelly-Springfield Tire Co., New York City, has decided to retire from the retail field in that city, and is notifying its patrons of the names of dealers and distributors of its tires to whom retail orders should be given. The company states that if a customer desires to have his requirements filled direct, the orders will be executed, but the invoice covering the goods delivered will be mailed from one of the jobbing houses.

ROYAL CORD TIRES HOLD BOTH TRANS-CONTINENTAL RECORDS.

Last month a new record of 5 days 3 hours and 31 minutes from San Francisco to New York was made by a car equipped with Royal Cord tires manufactured by the United States Tire Co. This breaks the world's record by 14 hours and 59 minutes. The men who drove the car in relays reported that they experienced no tire trouble whatever.

Not satisfied with this remarkable record, a return trip was immediately arranged for and made in 5 days 17 hours and 23 minutes, breaking all previous records from New York to San Francisco.

THE GRYPHON RUBBER & TIRE CORPORATION.

The Gryphon Rubber & Tire Corporation is now located in its commodious new factory overlooking the Harlem River at Kingsbridge, New York, on the line of the New York Central Railroad. This location is admirable with respect to cheap electric power,

suitable housing for labor, shipping facilities, and convenience to the market for raw material as well as for the sale and distribution of products. The company expects to begin the manufacture of tires about

the first of November, and modern equipment is being installed which will allow for an output of 400 completed tires—shoes and inner tubes—per day. The president is Joseph W. Jones, a prominent engineer and manufacturer of wide experience, and the general manager, A. E. Gordon, has had over 15 years' experience in the manufacture of tires and other rubber goods.

GOODRICH BRANCH CHANGES.

W. W. Ledger has been made local manager of the branch of The B. F. Goodrich Co. at San Diego, California.

William J. Schwan is now manager of the service station at Yosemite, California. This station is to be classed as a tire depot.

H. W. L. Kidder has been appointed local manager at the Columbus, Ohio, depot of the Goodrich company.

A. H. Willett has succeeded R. Hasler as manager at New Orleans, Louisiana.

The Phoenix, Arizona, branch is now located at the corner of First and Monroe streets.

PERFECTION TIRE & RUBBER CO.

It is reported that the Perfection Tire & Rubber Co., with offices in the Marquette Building, Chicago, and factories at Fort Madison, Iowa, and Wabash, Indiana, has purchased a large tract of land in the Factoria district of Fort Madison for the erection of 100 houses for the use of the company's employees. Five thousand dollars has been deposited with a local bank as a guarantee of good faith.

On September 1 a change in officers of this company went into effect, and they are now as follows: C. R. Cole, president; R. J. Evans, vice-president; E. A. Stickelman, treasurer, and C. W. Harris, secretary.

Charles C. Gehring, formerly manager of the Pittsburgh branch of the United States Tire Co., has been transferred to the Cleveland, Ohio, branch, where he will act in the same capacity.

PENNSYLVANIA RUBBER CO. CONVENTION.

At the recent convention of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, managers of 14 branches, including such distant points as San Francisco, California, and Seattle, Washington, gathered together at the home plant. Important problems of the coming season were taken up and discussed with the greatest interest, and announcements were made concerning the New Bar Circle automobile tire, shown herewith, and a new bicycle tire similar in style of tread, and also called the Bar Circle.

Two of the meetings were held at the Greensburg Country Club, where luncheon was provided, and opportunity afforded the visiting managers to play golf. The social features of the conference were exceptionally pleasant, including a reception at the home of Seneca C. Lewis, general manager of the Pennsylvania company, a chicken and waffle dinner at Si Poole's Farm, and a lamb roast and picnic at Immel's Reservoir.

The new slogan adopted by the company is "Eight Million Dollar Sales in 1917." The August sales of

the company were the most satisfactory in its history, reaching over the half million dollar mark.

BOONE TIRE & RUBBER CO. TO BUILD.

The Boone Tire & Rubber Co. will shortly erect a plant at Belvidere, Illinois, containing 25,000 square feet of floor space. The buildings will be U-shaped in plan. The dimensions of the main building will be 50 by 180 feet, with two wings, 60 by 120 feet. The initial plant will have a capacity of 150 casings per day, and

a full line line of mills, calenders, and mold and heater equipment will be installed to handle this number of tires. I. V. Maclean, formerly president and general manager of the Hawkeye Tire Co., is president of the Boone company.

A SIMPLE METHOD OF ALIGNING MOTOR CAR WHEELS.*

UNDULY rapid wear of tires is in almost every case due to disalignment of the wheels. This results in greatly reducing the normal mileage, even though wheels are only slightly out of parallel. To detect this defect and properly correct it requires something more reliable than the eye, but nothing very elaborate is called for.

The illustration shows a very simple and practical method. Two strips of wood about 7 feet long are placed together and a small hole is then bored in the ends of both strips at the same time. Two pieces of twine must be cut in exactly equal

lengths (about 15 feet each) and the ends passed through the holes in the strips and knotted, care being taken that the two lengths of twine are still equal. Two ordinary kitchen chairs are then placed, one in front and the other at the rear of the car, with their backs toward the vehicle. Each chair serves to support one of the wood strips and the two lines of twine are stretched on either side of the car parallel to each other. The lines being roughly in position, adjust one of the wood strips by sliding it on the chair until one of the rear wheels and its corresponding line is found to be exactly parallel, fore-and-aft, by measuring the distance between the twine line and the rim. Then bring the front wheel on the same side of the car into alignment with the twine, without disturbing the first rear wheel, which is easily done if the front wheels are jacked up.

If the four measurements are the same, the wheels "track" perfectly. However, a slight variation between the front and rear wheels is permissible, but the measurements fore-and-aft of each wheel must be equal. Similar measurements are then taken of the second rear wheel on the opposite side of the car and the remaining front wheel is measured in the same way as previously described.

CORRECTION.

Owing to a clerical error in rearrangement of the list of the Rubber Trade Preparedness Committee, in the September 1 issue, the name of the Continental Rubber Co. of New York was omitted, President G. H. Carnahan's name being credited to another corporation with a somewhat similar title.

*From an article by the Palmer Tire Co., Limited, London, England.

TRADE NOTES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has sent to the trade an announcement, effective October 1, of a reduction in the prices of its Vacuum Cup, Ebony Tread and Bar Circle tires, claiming that, notwithstanding the present high average level in the raw material market, the growing demand for its tires has enabled the company to effect substantial savings in cost, in which it permits its customers to share.

The United States Rubber Co., New York City, received the only prize offered for tires at the Exposition Nacional de Panama, held in the city of Panama in the spring to commemorate the discovery of the Pacific ocean by Balboa. This award was in the form of a diploma and gold medal, which have been recently received by the company.

Under the direction of H. H. Replogle, manager of sales, the sales organization of the Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, held a convention at the home plant during the week of September 11. The conference was devoted to important matters of sales business, particularly items pertaining to taking care of the increased business of the company, which has practically doubled during the last 12 months. The management was much impressed with the enthusiasm and loyalty of the sales staff, and it is planned to hold similar conferences annually.

The Hawkeye Tire & Rubber Co., Des Moines, Iowa, is now operating in all departments. Charles A. Besaw, president of the Quality Rubber Co., Hartsville, Ohio, is the consulting chemist.

The Tire Reconstruction & Supply Co., Inc., New York City, has increased its capital stock from \$25,000 to \$75,000. This company is the exclusive Eastern distributor of the "Reliable" tire. A service station is maintained at 685 Eleventh avenue for repairing of all kinds of tires and tubes, especially for the trade, and the reconstruction of old tires, which are guaranteed for 3,000 miles at approximately one-half the cost of a new tire.

The Lion Tire & Rubber Corporation, which some months ago acquired the H. J. Heinz Co. factory at Lafayette, Indiana, will shortly commence operation.

H. J. Succop has been placed in charge of the Oklahoma branch of the Atlas Tire Co., New York City, tire jobbers and retailers. Mr. Succop has been in the tire business for seven years, starting with The B. F. Goodrich Co., and prior to his connection with the Atlas company was manager of the Knight Tire Co. at Pittsburgh, Pennsylvania. He reports that the Atlas company has almost doubled its business this year, and is about to open five more branches.

The Walters Rubber Co. of New York, Inc., distributor of the product of The Federal Rubber Co., Cudahy, Wisconsin, and "Walters" red tube, contemplates opening a tire storehouse at Mineola, Long Island, from which prompt delivery may be made. H. S. Walters, secretary and treasurer of the company, was previously connected with the United States Rubber Co., and the Federal company.

John McTaggart, an automobile engineer of Philadelphia, Pennsylvania, has invented an inner tube said to be practically impervious to puncture. The inventor decreased the air chamber 22 per cent and introduced a flexible steel mesh into its construction, producing a tube which has withstood remarkable tests.

Indiana has a new rubber enterprise in prospect in the Alpha Rubber Manufacturing Corporation, notice of whose incorporation appeared in the August issue of THE INDIA RUBBER WORLD. Fifty thousand dollars of the authorized capital of \$1,000,000 has been disposed of, and \$75,000 is about to be issued to pay for a plant in Indiana. The new company expects to manufacture tires as well as reclaim rubber.

It is expected that the new factory of the Brunswick-Balke-Collender Co. at Muskegon, Michigan, will be completed within two months' time. The plant occupies 40,000 square feet of floor space and will cost between \$40,000 and \$50,000. In order to provide for the increase in the number of its employes, the company has also contracted for the erection of at least 24 double dwellings, to be occupied only by its own workers.

SEWELL CUSHION WHEEL CO. EXPANDS.

The Sewell Cushion Wheel Co., Detroit, Michigan, is enlarging all facilities to allow for an increased output of its product—a wood and steel wheel with a soft rubber cushion between the inner wheel and outer felly. Ample precautions are being taken to guard against shortage of material, the new addition increas-

ing the floor space fourfold and enabling the company to carry a large reserve stock of rubber cushions, wood and steel, and at the same time to greatly increase production, the sales so far this year showing more than 100 per cent increase over the same period last year.

The new building is of reinforced concrete and steel construction, 71 by 74 feet in dimensions, three stories and basement, and is located at the rear of the company's property at the corner of Gratiot and Beaufait avenues. The executive offices, private offices of officials, and a large general office and reception room will occupy the second floor, the remaining space on this floor to be used for manufacturing the wooden part of the wheels. The entire first floor will be used for a machine shop, assembling departments and a fireproof vault for valuable papers, etc., a large vault for storing rubber having been provided in the basement. Careful attention has been paid to all details affecting the health and comfort of employes, and every modern convenience, including several sanitary drinking fountains on each floor, will be supplied.

THE ALLIANCE RUBBER CO. REINCORPORATES.

The reorganization of the Alliance Rubber Co., decided upon at a stockholders' meeting on August 24, will include reincorporation under the name of the Alliance Tire & Rubber Co. Stockholders will receive preferred stock at par and a 20 per cent stock dividend payable in common stock of the new company, also having first call on the securities offered to the general public. The factory management will remain the same as it has been since the business was begun.

The Alliance company has been unable to take care of all the business that came its way during the past year and the extra capital will be used for the enlargement of the factory, including a three-story structure closely resembling the original plant; the installation of additional mills, calenders, vulcanizers, molds, cores, etc., and the purchase of crude rubber and fabrics in larger quantity than has heretofore been possible.

The Obituary Record.

PIONEER IN THE GUAYULE INDUSTRY.

FRANCISCO MADERO, father of the late President Madero of Mexico, and one of the first to develop the guayule industry, died at his residence in New York city, September 3,

aged 67 years. He was born on March 11, 1849, at Rio Grande, in the State of Coahuila, and was educated in Belgium, graduating from college there with high honors. His grand father, Francisco Madero, owned nearly a million acres of land in Texas, but at the time of the war between Mexico and the United States, the family fled to Mexico, where, with his son, Evaristo, he settled at Rio Grande. Later the family moved to Parras, Coahuila, where Evaristo and

FRANCISCO MADERO.

Francisco, his eldest son, assisted materially in building up a new fortune. They bought a large acreage of land at Parras, established cotton mills and planted extensive vineyards, manufacturing cloth, raising wheat and making wine. Later, Francisco acquired a cotton plantation to supply cotton for the mills.

When it was discovered that guayule was a rubber producer, Francisco, his brother, Gustavo, and an American college friend, were among the first to appreciate the value of the discovery, and they at once instituted a factory at Parras for the extraction of the gum. They afterwards built factories at several points in Mexico, the family acquiring more than 2,000,000 acres, or more than 4,000 square miles, where the guayule plant grew wild. Francisco owned, personally, the works at Cuatro Cienegas in Coahuila, the principal factories belonging jointly to himself and other members of the family being the "Compania Explotadora Coahuilense, S. A." at Parras, and the "Compania Ganadera de la Merced, S. A." at Cuatros Cienegas. These plants were fully equipped for the extraction of the gum. In 1908 the eight factories were producing 350 tons a month, and an immense business was being done up to the time of the recent internecine war in Mexico, during which his son, Francisco I. Madero, then president of the Republic, and another son, Gustavo, were assassinated in February, 1913. The family fled to this country, and have resided in New York City ever since. The entire Madero property was confiscated about a year ago, but a month ago was returned to the family by the present *de facto* government.

The deceased was a typical representative of the high-class Mexican family—a wide-awake, enterprising business man, and a polished gentleman. He attained to the thirty-third degree in Masonry. He was fond of searching out deserving, talented young men, and paying for their education. Since his death many of the young fellows who were taken over by his family have

come to light through letters of condolence. He was highly honored in his own country and had many friends there, as well as a wide circle in New York City.

Francisco Madero married Miss Mercedes Gonzales Treviño, of Monterey, Mexico, who survives him. They had seven sons and four daughters, all of whom are now living except the two above mentioned.

AN EFFICIENT YOUNG OFFICIAL.

PAUL SCHMIDT, secretary of the Rubber & Guayule Agency, Inc., New York City, died at the Englewood Hospital, Englewood, New Jersey, on his 29th birthday, after many months of suffering. Mr. Schmidt was born in Hamburg, Germany, September 13, 1887, and received his education in the public schools of that city.

PAUL SCHMIDT.

On graduating he entered the office of Weber & Schaer in Hamburg and for ten years occupied steadily advancing positions in the rubber department of that concern. Three years ago he came to New York City and entered the employ of the Rubber & Guayule Agency, Inc., of which he became secretary and a director.

Early in the present year Mr. Schmidt made a trip to Mexico in behalf of the company, remaining there about two months, during which

time he evidently contracted a serious malady which was undoubtedly the ultimate cause of his death. After his return to New York he was operated on for appendicitis, and on account of his weak condition he suffered a relapse, causing his death on the date mentioned.

Mr. Schmidt was engaged to be married to an estimable young lady in Hamburg but, because of the war and also on account of his sickness, the wedding had been postponed until November of this year. He was a young man of unusual ability and promise and his early demise is the cause of profound regret, not only to his business associates but also to a wide circle of friends and acquaintances which he made during his residence in this country.

ROBERT J. BOWES.

Robert J. Bowes, for 27 years connected with the Lawrence Felting Co., of Millville, Massachusetts, and one of the best known mill men in Southern New England, died at his home in Millville, on September 11, from heart and kidney complications brought on by chronic rheumatism. He was born in Lawrence, Massachusetts, July 16, 1871, and moved to Millville with his parents in 1877, and had lived there ever since. He was educated in the public schools in Millville and Blackstone, Massa-

chusetts, and graduated from the Woonsocket high school, at Woonsocket, Rhode Island.

Following his graduation he entered the Lawrence Felting Co. with his father, the late William J. Bowes, who was the founder of the plant and for years its manager. Upon the death of his father, Mr. Bowes assumed management of the business and continued in charge for some time after the United States Rubber Co. acquired it, remaining until July 1, 1915, when, after 27 years' service, he resigned on account of poor health.

During the past summer Mr. Bowes spent much of his time at his summer home at Pleasant View, near Narragansett Pier. About the first of September he experienced a change for the worse and later returned to Millville, where he had another sinking spell and gradually grew worse until death came. He was a member of Millville Lodge, United Workmen, and Woonsocket Lodge of Elks. He is survived by his wife and two daughters, his mother, three brothers and two sisters.

LIEUTENANT ROBINSON.

President W. H. Robinson, of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, has the sympathy of his hosts of friends in the trade in the recent loss of his son, F. Reginald Robinson, who was killed in action on August 19. When the 73rd Royal Highlanders of Canada was organized, he was among the first to join, and afterwards qualified as a lieutenant. His battalion went to England early this spring, and he had been only one week at the front when death overtook him.

A VETERAN BOOTMAKER.

Otis York, one of the oldest employes, as well as one longest in service, in the Boston Rubber Shoe Co.'s Fells factory at Malden, Massachusetts, dropped dead of heart disease at the

door of his home in that city on September 15. He was 65 years old.

HIS SON WELL KNOWN IN THE TRADE

James L. Locke, father of Colonel Frank L. Locke, for many years superintendent of the Boston Rubber Shoe Co., died at the home of a nephew in Chichester, New Hampshire, aged 84 years. He is survived by two sons and two daughters.

S. SCHEIN & SONS, INC.

The New York and London headquarters of S. Schein & Sons, Inc., dealers in crude and scrap rubber, are in process of enlargement. The New York City branch was opened about a year ago at 140 Nassau street, and warehouse facilities being found necessary to care for the expansion of the company's American business, a six-story building was secured at 30 City Hall Place, where alterations and improvements are now being made. The European headquarters have been transferred from Finsbury street, London, to 66-70 Lawrence Road, Tottenham, England. This new plant has a frontage of 240 feet and a depth of 230 feet, and consists of two buildings, completely equipped for the expeditious handling and grading of rubber material in crude, scrap, finished or semi-finished state. Simon Schein and his son, Stanley, are in charge of the business at Tottenham, the New York plant being under the supervision of Joseph and Maurice Schein.

The manufacturers of toys in Canada formed an association last March to foster the production and marketing of Canadian made toys in the Dominion. The rubber toy industry is appropriately recognized by the choice of J. A. Wade, of the Canadian Consolidated Rubber Co., Montreal, as vice-president.

POOR PACKING OF PONTIANAK.

Rubber manufacturers have often complained of the bad shape in which rubber arrives, particularly when it comes from a distance. The accompanying illustration shows a shipment of Pontianak just as it was unloaded at Bush Terminal Docks, Brooklyn, New York. The picture is so graphic that further comment is unnecessary.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

A STATISTICAL report for the state industrial commission reveals the fact that during 1915 the rubber companies in Summit County, Ohio, practically all of which are in Akron, paid \$21,733,088 in wages and salaries. This is 61.1 per cent of the total payroll of the county, and is far in the lead, the second largest being that of the foundries and machine shops, with only \$2,495,120.

Although hundreds of new homes have been built in Akron during the past summer, the housing problem is still unsolved. Many changes at the factories are due to the fact that men come here to work, expecting to bring on their families, and when, after six months' time they are unable to find a house for rent, return where they came from because they cannot afford to maintain their families in other cities. Officials of The B. F. Goodrich Co. and other concerns employing thousands of men are now working on plans to meet this growing need. A plan similar to the farm credits system, where the men would eventually become home owners, has been proposed. This, it is urged, would not only insure permanent growth, but would induce workmen to save.

The Goodyear Tire & Rubber Co. has solved the housing problem for its employes by building houses on the easy payment plan. An addition of 350 acres has just been made to Goodyear Heights, a tract of land laid out for workmen in the plant of the company. On this land employes can build their own homes on the basis of rent, without any large first payment.

Activities of Akron's building and loan associations will be made clear to citizens who do not fully appreciate their work when the Ohio Building and Loan Association meets in Akron October 11-12, in its annual convention. All visitors to the city will be given rubber badges made in elaborate designs. When this association was organized there was no state control of the funds of building and loan associations, and through its efforts a bill was passed submitting all such institutions to state examination so the interests of their patrons would be safeguarded.

* * *

It is reported that the Kelly-Springfield Tire Co. has decided to change its location to Cumberland, Maryland. It is understood that the authorities of that city have offered very large cash and land inducements, involving \$750,000 and 75 acres of eligibly located land for a factory site.

* * *

It was proposed at the meeting of the Firestone Tire & Rubber Co., held September 30, that the capital stock shall be increased from \$4,000,000 to \$50,000,000, of which \$40,000,000 is to be common and the balance preferred. Present holders of \$1,000,000 preferred stock have been notified that the entire issue will be redeemed at 110, November 1. It is also the present intention to declare a 700 or 800 per cent dividend on the common stock. The full report of this meeting will be published in the next issue.

* * *

The track team of The B. F. Goodrich Co. won the one-mile relay race and the Police Trophy cup at the Police Field Meet held at Cleveland, Ohio, last month. The Akron team walked away with all the honors from Cleveland's best factory athletes. They won first and second in the mile, second in the 220-yard dash, second in the quarter, third in the high jump, and first and second in the half-mile, or a total of 36 points, 19 points more than the Hydraulic Pressed Steel Co. team, which was second in the meet.

* * *

Present building operations of the Goodyear Tire & Rubber Co. include more room for the office force as well as the factory

workers and will provide a much larger capacity both for tires and mechanical goods, one new building now nearing completion being devoted exclusively to the manufacture of mechanical goods. To provide for the constant flow of electric power and at the same time conserve the water supply which rotates the 10,000 K. V. A. turbine at the plant of the Goodyear company, a battery of five cooling towers is being erected.

At the Goodyear field and track meet held on Labor Day at Seiberling Park, more than 1,000 persons competed for supremacy in the various sports. The field was resplendent with the Goodyear colors, orange and black, and large American flags, and the carnival opened with a baseball game between the Akron and Boston Goodyear teams, won by the home team. While this was in progress, boxing and wrestling events were conducted in two separate rings. Races of every kind and description followed, as well as fancy diving, quoits, tennis, bait casting, nail driving, trap shooting, cock fights, clock golf and greased pig chases.

Woodson Reese, for the past two years manager of the Goodyear branch at Philadelphia, Pennsylvania, has been transferred to Akron as special factory representative.

* * *

The Denmead Rubber Co. will locate on the Denmead property in East Akron. Nearly three acres of land compose this property, which has the finest water privileges in the state, the Little Cuyahoga River passing through a part of it.

The Denmead company will take over from the Denmead Tire & Supply Co. the manufacture of rubber heels and soles and also the good will of the latter company.

* * *

The capital stock of the Star Rubber Co. has been increased from \$200,000 to \$400,000.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

FALL trade opens well in most lines of rubber business. In mechanicals the report is that the call for rubber belting is greater than a year ago, a fact that has been attributed to the great increase in cost of leather belting, material for which is fully double its normal price. But two leading leather belting manufacturers have told your correspondent that the demand for their product is up to the average, despite the high prices, so that the increased demand for rubber belting must be credited to a larger general demand for all kinds of belting, or to a conversion of users to a preference for that made of rubber.

* * *

There is a very general satisfaction shown by the trade that the new tennis footwear price lists, which appeared early last month, showed but a moderate increase over the figures of last year. The higher cost of cotton duck amply justifies the advance in footwear made from this material.

* * *

Speaking of cotton duck brings to mind that the steady increase in the use of automobiles, and the consequent present and prospective demand for tires, is a matter which is being given most serious consideration in the textile industry of New England. The production of fabrics suitable for the manufacture of tires has hitherto kept pace with the demand, but that it will continue to do so is an open question, for two reasons. One of these is the possible lack of supply of suitable raw material, and the other, the insufficient productive capacity of the factories equipped to make such fabrics. Of these mills, many are situated in this section, and are largely financed by Boston capital.

Many of the leading concerns, which specialize in auto-tire fabrics, have increased their capacity for such fabrics, while others have made preparations for doing so, but here they are finding a new difficulty, the inability of loom manufacturers to fill their orders promptly because of the increased demand. Among the most important of these enlargements is the building of the American Tire Fabric Co.'s factory at Newburyport by Boston and New York interests, in which a capital stock of \$1,500,000 is authorized by its charter. Another is the erection of another factory at the plant of the Manomet Mills at New Bedford, for which additional stock to the amount of \$1,000,000 has been issued. The Manhasset Manufacturing Co., of Putnam, Connecticut, is planning to nearly double its output of yarn for tire fabrics, and the Killingly (Connecticut) Manufacturing Co. has quadrupled its product of tire duck within the last two years, and it is reported, contemplates the erection of a yarn mill to supply the increased demands of its looms. The Atlas Yarn Co. has acquired a mill at Southbridge, Massachusetts, and is producing yarns specially for tire fabrics. Mention was made recently in your columns of the increase in capital of the Connecticut Mills Co. and the acquisition of the Nemasket Mill at Taunton, this state, where it will manufacture about one-half the yarn required for its weaving at Danielson, Connecticut. The West Boylston Co.'s factory at Easthampton, Massachusetts, is running to its utmost capacity on yarns and auto-tire duck. The Bay State Cotton Corporation, which completed a \$100,000 addition to its plant at Lowell about the first of the year, is now running exclusively on tire duck. The Katama Mills at Lawrence is a \$500,000 enterprise for manufacturing tire fabric.

Thus it will be seen that New England is fully alive to the importance of supplying proper fabrics for the production of automobile tires, and that large amounts of Boston capital are invested in this industry. Indeed, there is much Boston money in many similar enterprises outside of New England. But that is another story.

* * *

The Apsley Rubber Co. is doing some active advertising in New England. The writer visited Eastport, Maine, last month, and was surprised to note, on landing, that practically two-thirds of the people were wearing little celluloid flag pins bearing the Apsley trade-mark. A "fish fair" was in progress, which had all the earmarks of a county fair. The Apsley Rubber Co. had a working exhibit, two expert workers making rubber footwear, supplementing which was a full line of the Apsley specialties in boots, shoes and tennis lines. The "Rock Hill" boots made by this company are very popular with fishermen along the coast of Maine and as far as the Grand Banks, and at a drawing, bearing some resemblance to a lottery, the second and third prizes were a pair of these fishermen's boots and a pair of ladies' rubbers. Naturally the Apsley footwear got pretty extensive publicity in connection with this fair.

* * *

The Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana, also had an exhibit at the Eastport Fish Fair, showing a full line of their "Ball Band" boots and rubbers. The B. F. Goodrich Co., Akron, Ohio, had a fine exhibit in the window of the principal shoe store.

* * *

At the county fair held at Barnstable, Massachusetts, The B. F. Goodrich Co. had an extensive and attractive exhibit of its many lines of footwear. This was under the personal charge of J. S. Capen, the director of New England sales. Mr. Capen seemed as popular among the fair visitors as he is with his customers, and the exhibit was a center of attraction during the few days the fair was held.

A recent discovery and an accidental one at that, which may be of interest to the rubber trade, is that of the finding of a deposit of fuller's earth, ranging in depth from 3 to 70 feet, in Stoughton, this state. The earth has been declared to be of excellent quality, and now, instead of changing the farm to a "bog" for the production of cranberries, a concern has been capitalized for \$75,000 under the name of the Stoughton Earth Co., to mine and market the product, which has been given the name of "Stoughton Flake."

* * *

The Plymouth Rubber Co., manufacturer of heels and soles, proofed fabrics and artificial leather, will soon erect a new building at its plant in Canton. It will be of concrete, two stories high, 100 by 150 feet.

* * *

Robert B. Baird, vice-president of the Rubber Trading Co., New York City, with Mrs. Baird, last month toured New England by motor, and visited many friends in this section.

* * *

One of the perils of making one's own cement was exemplified in the explosion which occurred at the factory of the Hazen-Brown Shoe Co. at Brockton one day last month. A large quantity of material being churned, caught fire, and in the consequent explosion one man was seriously burned, eleven others more or less injured or their clothing set afire, and the ell in which the machine was located was demolished, causing a loss of about \$10,000.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE activities of the rubber industry throughout the State continue to keep the several factories operating to their capacity and the orders on hand or in sight indicate steady work for an indefinite number of months. Large quantities of shoes, tires and other products are being daily shipped to all parts of the country, as well as to many foreign markets, the domestic demand being much greater than has been experienced in a long time. The shortage of help, which for several months has been a great problem and handicap with the different concerns, is as acute as ever.

* * *

The National India Rubber Co. has materially improved its plant at Bristol, and is still engaged in further additions and changes that are calculated to increase the size of its factory and to extend its facilities. At the present time approximately 3,500 hands are employed in the several departments. The factory resumed operations on Tuesday, September 5, after a two weeks' shutdown for the purpose of taking an account of stock.

Good progress is being made in the construction of the two-story brick addition to the vulcanizing department of the National company's plant, opposite the east end of Bourn street. This addition has a frontage of about 150 feet on Wood street and will be about 100 feet deep. As soon as the new structure is ready, a number of modern vulcanizers, and other machinery will be installed. A three-story brick building for a box shop is being erected on the site of an old structure, that will be 80 by 100 feet, with a tar and gravel roof, sprinklers and electric elevators. The company has also secured a portion of the old handkerchief plant, on South Main and Broad streets, Warren, that is to be used as an auxiliary storehouse.

* * *

At the monthly meeting of the Bristol Town Council in September the National India Rubber Co., upon its application through James W. Franklin, superintendent of the footwear division, was granted permission to lay a large sewer pipe from the factory on Wood street to the westward through Bradford street to the harbor. The company has for many years used

millions of gallons of salt water which is pumped from the harbor just south of the DeWolf Inn to the factory, and after being used is returned to the harbor. Trouble has been experienced for some time because of the failure of the present pipes to carry the water to the harbor, and the company is desirous of installing larger pipes, and thus overcoming the difficulty. The contract for the work has been awarded and it is proposed to lay iron pipes 22 inches in diameter.

* * *

The International Rubber Co. is operating its factory at West Barrington on an overtime schedule evenings, in an effort to catch up with rush orders, of which it has a large number on hand for carriage cloth, upon which the concern is at present specializing. The company has just completed an important addition for a new filter system. The addition is a wooden building, two stories high, and measures approximately 50 by 60 feet.

The new structure contains two sets of tanks, large enough to take care of all the waste from the dyeing vats during the day. Each day the waste is carried into one set of vats. The day after it reaches the filtration building the liquid is first treated with chemicals and then is pumped to the presses where much of the sediment and precipitation is eliminated. The liquor is then conducted by pipes to another tank and is passed over the sand filters. When it passes through this operation it is purified and its color has been changed from an inky black, in which condition it leaves the dyehouse, to clear water.

The installation of this system was made necessary because of complaints that were made from owners of oyster beds near the outlet of the stream into which the company's refuse water flowed. Suits were brought in the State courts against the International Rubber Co. and another corporation, with damages aggregating \$100,000. These were finally settled and the concerns agreed to take such preventive measures as would be necessary to eliminate the contamination.

* * *

Frank B. Wilson has resigned the position of receiving clerk and storekeeper at the factory of the National India Rubber Co., Bristol, after a long term of service, to accept a similar position with the Lee Tire & Rubber Co., at Conshohocken, Pennsylvania, taking up his new duties early in September. Mr. Wilson had been employed by the National India Rubber Co. for nearly 30 years, 22 of which were in the position he has just resigned. He had charge of the raw material in the company's storehouse.

* * *

The Bourn Rubber Co., Warren street, Providence, is so driven with orders in practically all of its departments that it is constantly hiring additional help as fast as they can be placed and broken in. This is especially true in the lumbermen's and arctic departments. The firm is advertising for rubber shoe and quarter makers and is also taking on a number of learners.

* * *

The factory of the Narragansett Rubber Co. at Bristol closed on August 31 and reopened the day after Labor Day. During the shutdown the machinery was given a thorough overhauling and a number of repairs were made. The factory is very busy on orders and has enough work in sight for at least six months or more to come. Additional help is being constantly hired for all departments.

* * *

An addition that will entirely alter the appearance of the factory is being erected in connection with the main building at the Knightsville plant of the Atlantic Tubing Co. The new portion will cover in the big water tank at the top of the old structure that has been such a prominent landmark. The company reports an unusually busy season since something over a year ago.

Roswell C. Colt, who has been spending his vacation with his mother, Mrs. Samuel P. Colt, at her home in Bristol, has returned to Montreal, Canada, where he is purchasing agent of the Canadian Consolidated Rubber Co., Limited.

* * *

John J. Farley, formerly foreman of the mechanical department of the National India Rubber Co., Bristol, but now manager of the Milwaukee, Wisconsin, branch of the Federal Rubber Co., has been spending his vacation with his mother at Bristol.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

A LITTLE army of machinists will be put to work probably within the next two or three weeks installing tire-making equipment in the new addition of the Ajax Rubber Co., which is now rapidly nearing completion. The addition is three stories high. It is 350 by 60 feet and will enable the company to devote an extra 63,000 square feet of floor space to the making of the famous Ajax tires. A new engine room 50 by 100 feet has also been erected. An overhead bridge connects the new addition with the main factory, which is on the opposite side of the street.

* * *

The Thermoid Rubber Co. is justly proud of the record made by its brake lining, used on the car in which S. B. Stevens recently completed a trip from New York to San Francisco. The journey was made in the remarkable time of 5 days and 18½ hours. Thermoid brake lining was used for the cone clutch and "Thermoid 100 Per Cent" for the brake lining. In addition to giving perfect service on the trying journey the lining was in excellent condition at the end of the trip.

* * *

The rubber industry of Trenton will be widely advertised, in the near future, by means of miniature posters or stamps to be affixed to the outgoing mail of every concern connected with the trade. The poster, which is in three colors, shows a tire, in the center of which is the figure of a *seringueiro* tapping a rubber tree. It is estimated that hundreds of thousands of these stamps or posters will be sent out from Trenton in the next year, thus giving wide publicity to the importance of the rubber industry in this city.

* * *

The Post Tire and Rubber Co., which sent out a circular letter to prospective stockholders, intimating that it would consolidate three tire-making plants in Trenton under one head, has evidently met with disaster. When the representative of THE INDIA RUBBER WORLD called at the offices of the concern to learn what progress had been made in the consolidation plans, he was confronted with a notice tacked upon the office doors announcing that the bank officials had obtained a distraining order covering the office furniture for rent alleged to be due. President Post, who, it is said, came here from Washington, D. C., to promote the business, could not be located. One of the companies it was planned to take over (according to the circular) announced that the first intimation it had of such a move was contained in an unauthorized statement in the letter seeking stockholders.

* * *

The Semple Rubber Co., which makes tubes exclusively, is steadily forging ahead. It was necessary recently to take over additional room for manufacturing purposes. Charles Semple, president of the concern, is a rubber man of many years' experience. He has reduced the making of tubes to a scientific basis. The uniform success that has attended his efforts seems to point

the way to a volume of business which is likely to outgrow the firm's present quarters in the near future.

* * *

Superintendent Metzler, of the Goodyear Tire and Rubber Co., Akron, Ohio, was a recent visitor here. He renewed many friendships with rubber men. Mr. Metzler was connected with the Hamilton Rubber Co. several years ago.

* * *

Frederick F. Katzenbach, vice-president and treasurer of the Katzenbach & Bullock Co., has returned from a vacation spent in the Adirondacks and along the Mohawk Trail.

* * *

A delegation of Trenton public school teachers was taken on a tour of inspection of some of the rubber mills a few days ago. The school board considered that in view of the important position occupied by rubber manufacturing in Trenton it would be well for the teachers to know something about the process of making it.

FIRST AID IN ELECTRICAL SHOCK.

The extended use of electricity in rubber mills, and the possibility of accidents makes interesting the following first aid treatment for electrical shock: Raise the limp body by the ankles with the whole weight resting on the neck, and then let it fall; hammer the soles of the feet without removing the shoes; pull forward the swallowed tongue. Such treatment frequently brings the injured man to consciousness. [N. E. L. A. Bulletin.]

RUBBER STAMP PRICES REDUCED.

THE Traun Rubber Co., New York City, has sent out a new price list, showing a material reduction from former rates. The various kinds of stamp rubber, including the different degrees of hard and soft, red, white and oil proof, are now quoted at from 70 cents to \$1.50 per pound for regular stock gage (14 Stubbs or 12 B. & S.). Other thicknesses rolled to order at special rates. Rubber dam, manufactured expressly for making molds, is quoted at \$1.45 per square yard. Printing type compounds $\frac{3}{8}$ inch in thickness now range from 40 to 80 cents a pound.

Sponge rubber is offered at varying prices, according to amounts ordered. Quotations here given are for single pounds, with a considerable reduction on 10-pound and 25-pound lots, and still heavier discount on 100-pound lots. For instance, sponge rubber in 20 by 24 inch sheets, $\frac{1}{8}$, $\frac{3}{16}$, $\frac{1}{4}$ and $\frac{3}{8}$ inch thick, is quoted at \$1.25 per pound; for 10-pound lots, the price is \$1.05 per pound; 25-pounds cost 90 cents a pound, and 100-pound lots are listed at 85 cents. Similar reductions are shown in quotations of other sponge rubber, the single pound prices being as follows:

One-half inch thickness, in sheets	\$1.75
Sponge rubber strips, 16 inches long, machine-cut from sheets, any width, $\frac{1}{8}$ to $\frac{3}{8}$ inch thick	1.35
Sponge rubber for artists' use, in slabs 14 by 16 inches, unskinned, $\frac{1}{8}$, $\frac{3}{16}$ or 1 inch thick	1.75
Sponge rubber, skinned, as above	1.85

Prices of other varieties of rubber for stamp manufacturing purposes are unchanged.

INSULATED WIRE TESTING LABORATORY OF ELECTRIC CABLE CO. BRIDGEPORT, CONNECTICUT

AN INSULATED WIRE TESTING LABORATORY.

More important than any other department in an insulated wire or cable factory is the testing department. No expense is spared in equipping it with delicate and accurate instruments that instantly detect faults, and that measure with wonderful exactness the insulation that the rubber covering affords. This work is in the hands of expert electrical engineers, and records for every foot of rubber covered wire are taken. While this work was brought about primarily by insurance interests, the manufac-

turers have not only met their specifications, but in their search for perfection have bettered the requirements by a large margin. So it comes about that laboratory, mill room and particularly the testing room in insulated wire work are keyed up to the best and highest efficiency.

Speaking again of the testing room, its equipment, in part, consists of galvanometers and Wheatstone bridges, high voltage testing sets, machines for testing rubber, and fabric and yarn testing machines.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THERE are no complaints to be heard regarding the general volume of trade. Although a period of something like slackness has been experienced, owing to cessation of government orders, these have now come in again, a fact which supports the general opinion that hostilities are now expected to last well into next year, instead of coming to an end by Christmas. The movement in favor of protective duties is being energetically pursued, but it may be remarked, that although those of the free trade persuasion are not making much noise at present, they certainly intend to assert themselves when legislation comes to the fore.

A matter which is likely to be of even greater moment is already attracting a good deal of attention, namely, the future of labor. There is no doubt a difficult time before the employer, as it is recognized that the present high wages being earned up and down the country will be desired as a permanency by labor, and be objected to by the employers. The appointment of Mr. Henderson, a cabinet minister, as labor adviser to the government is a sign that trouble is apprehended. At any rate the appointment is a recognition that the relation of master and man is likely to undergo a change in the future. It rather looks as if the masters will be allowed to make a certain profit to be agreed upon, the rest of the profit to go to the men. This would be an extension of the profit-sharing schemes which are already in operation at a few large works. The question arises, however, will the capitalist care to conduct business on these lines, or will he think it preferable to invest his money in securities and live a life of leisure, or at any rate, one free from the recurrent anxieties of business?

RECLAIMING TEXTILES AND RUBBER.

Several patents have had as their object the recovery of the textile material as well as of the rubber from rubberized fabrics, but I do not think that any have proved commercial successes. The latest patentee in this direction is Charles de Villers, of Neuilly-sur-Seine, France,* who treats the fabric with tetrachlorethane at its boiling point, whereby the rubber goes into solution, leaving the fabric unaffected. The solvent having been removed by distillation, the rubber is obtained of a quality quite comparable to best quality fresh rubber. This latter phrase always appears in reclaiming patents, but rarely with strict propriety. However, a friend of mine who has seen some of the rubber, was struck with its quality, and I understand that it is about to be put on the market. Cotton fabric has generally been considered not worth recovering, but the present price of cotton is in favor of any recovery process. The difficulty about wool has always been that to be salable it must be absolutely free from particles of rubber, a result which does not seem to have been attained in previous patents. Perhaps this patent will solve the problem.

NITRE CAKE IN RECLAIMING.

The article in the August issue of THE INDIA RUBBER WORLD on the use of nitre cake in reclaiming has naturally attracted attention on this side, as the price of mineral acids is much higher than in pre-war times. Moreover, nitre cake, like cinders, can be had for the removal, if one is lucky enough to find a horse and cart available. Large quantities of this by-product of the nitric acid manufacture have been thrown into the sea, though recently, owing to the offer of a prize for a process whereby it could be utilized, it has found some applications.

The article does not say what it costs delivered to the American works, which are stated to have used it successfully, but, anyhow, in the ordinary acid reclaiming of textile cuttings, the cost of the acid is not a large matter when the selling price of the reclaimed is considered.

RECLAIMING NOTES.

The Xylor Rubber Co., of Trafford Park, Manchester, shows continual development and I understand that extension of premises is considered inevitable. The reclaiming of red rubber is now a special feature of this works, very satisfactory results having been obtained.

Dilution of labor owing to the necessities of the war, that is, the replacement of men by women, has recently been adopted in reclaiming works to such extent as has been considered advisable, due regard being paid to the risks involved. With regard to this I hear that the factory inspectors have been much impressed by the automatic cut-out switch which is one of the advantages of the electric driving of rubber rolls.

BUSINESS AND PERSONAL NOTES.

I notice with regret the announcement of the death of Percy Carter Bell, who was better known in American rubber circles than in England owing to his long business life in New York City. The son of the late J. Carter Bell, public analyst for Cheshire and Salford, he obtained his first knowledge of rubber from his father, and at the works of I. Frankenburg & Sons, Limited, Salford, prior to Dr. Weber coming upon the scene.

J. C. A. Ward, chairman of Callender's Cable Co., is to represent the employees' side on the special tribunal to hear appeals of railway men with regard to military service.

The act extending the provision relating to unemployment insurance to rubber workers came into force on September 4, and at a special conference held previously in London, the rubber industry was represented by James Tinto of the Irwell and Eastern Rubber Co., Limited; Mr. Wilson, secretary of the India Rubber Manufacturers' Association; H. H. Duke, national organizing secretary of the Amalgamated Society of Rubber Workers, and A. Allison, London organizer of the same society. The trade generally appears to be against this extension of the act, mainly because of the difficulty in defining a rubber worker, and also because of the additional clerical labor which will devolve upon depleted office staffs.

Motor *char-à-bancs*, which have come into increasing use and size at tourist resorts during the last few years, were stopped by government order on September 1, on account of the scarcity of petrol, in which term is included any mixture containing hydrocarbons.

The Wood-Milne Co., Limited, like the North British Rubber Co., Limited, and the Dunlop Rubber Co., Limited, has found it necessary to extend its tire manufacturing premises. The company is now building a new works, having bought some extra land at Sandy Lane, some hundred yards distant from the present works at Leyland. The new works is to be devoted to the production of solid band tires and pneumatics.

Vacuum driers made by the J. P. Devine Co., Buffalo, New York, are giving great satisfaction to reclaimers here. With their use there is no need to go to the extent of drying necessary in the case of raw rubber, as several per cent of water can be left in the rubber, to be entirely removed in the subsequent process of sheeting on the rolls.

Determinations of specific gravity are frequently required in reclaiming works, and it may not be out of place to mention

*Noted in INDIA RUBBER WORLD, May 1, 1916, page 412.

that the gravitometer made by Eimer & Amend, New York City, and featured in Mr. Pearson's book, "Rubber Machinery," is in regular use at one of our largest works. So far I have not heard of its being in use at any of our rubber factories.

SOME FOREIGN RUBBER INTERESTS.

THE American Consul-General in Sidney, Australia, reports that an American salesman visiting his post stated that he had secured orders for \$300,000 worth of rubber tires in Australia.

According to a report by the British trade commissioner in Australia the total imports of rubber goods into that country during the first three months of 1916 amounted to £278,474 [\$1,355,194], of which £130,245 [\$633,837], more than 45 per cent, were from the United States. The balance was shared as follows: British Possessions, £85,437 [\$415,779]; Great Britain, £62,167 [\$302,536], and Japan, £625 [\$3,042].

The French Government has recently placed an export embargo on talc.

The Russian Minister of Finance has decided that the certificates of origin now required for nearly all articles imported into Russia may be dispensed with in the case of samples of no commercial value. Such samples are exempt from import duty.

The American Consul at Saloniki, Greece, reports that several lines of American goods have been recently introduced there and that the Municipal Hospital has placed an order for \$100 worth of American rubber gloves.

According to a recent report of the American Vice-Consul at Singapore, Straits Settlements, there is a great future for automobiles and motor trucks in those states.

The country is at present in a fine financial condition, due to the high prices for rubber and tin, the two leading exports. The greatest drawback to the rapid growth of the automobile trade is the lack of ocean tonnage.

Rubber tires cost approximately 15 per cent more than in America.

The Swedish War Trade Law of April 17, 1916, made it illegal for an importer in Sweden to furnish an exporter in Great Britain with information as to the disposal of goods.

The British exporter was therefore often obliged, in reply to challenge of the British Customs, to admit that he was unable to furnish the evidence required from him and was thus exposed, through no fault of his own, and simply by the operation of the Swedish law, to heavy penalties.

These circumstances led the British Government to issue a Royal Proclamation prohibiting the exportation to Sweden of all commodities, and now, apparently as a result of the British export embargo the Swedish Government has placed an export embargo on the following articles containing rubber:

"Hose, transmission and conveying belts, whether sewn or not, heddles and other cotton articles containing rubber; tissues and other textiles not containing silk, impregnated or covered with rubber, or attached by means of rubber solution or layers of rubber."

RUBBER SEED OIL.

According to advice from the Far East, the Government of the Federated Malay States has decided that no export duty will be imposed in respect to rubber seed oil or products for a period of ten years from June 9, 1916. The object of this decision is to encourage the local industry of extracting oil from rubber seed and the preparation of this oil and residues or other products of the seed for the market.

THE RUBBER TRADE IN GERMANY.

By Our Regular Correspondent.

GENERAL conditions are better than one would expect under the circumstances. Many factories are working overtime, and a number of concerns have greatly enlarged their plants, while others have entirely changed the character of their products, adding new machinery and adopting new processes to meet the demands created by the war.

Labor conditions, generally speaking, continue excellent. The machine and metal industries have been specially favored by the military authorities on account of the importance of having skilled mechanics in those shops which are working on war contracts. The same applies to certain branches of the rubber industry.

There is a scarcity of skilled and also of unskilled labor in some districts, where the industries are not suited to the employment of women and disabled soldiers, and where war

AUSTRIAN ARMY TRANSPORT MOTOR TRUCK. NOTE THE WORN STATE OF SOLID RUBBER TIRES.

prisoners are not available. For a time the government allowed furloughs to soldiers needed for work at home, but of late the pressure at the battle fronts has become so formidable that this course can no longer be followed.

There is plenty of money in circulation, and the financial situation is far better than conditions would lead one to expect. Savings deposits show an increase.

Manufacturers of aeroplanes, motor vehicles and electrical supplies continue very busy with war contracts, and in producing stocks to be held in reserve in anticipation of a demand for cars upon the cessation of the war.

The building trades are most severely affected by the war. No new work is started, architects and builders being occupied with the slow completion of old contracts and a few factory extensions mentioned above.

The brewing industry, which has always been a large purchaser of rubber goods, is suffering from the lack of raw materials and the restrictions placed on the consumption of its products.

INCREASED COST OF LIVING.

Notwithstanding the fixing of maximum prices for foodstuffs by the authorities, the regulating of the consumption of such products and the control of distribution by the system of sales against supply cards, furnished monthly to each inhabitant, the cost of living in our large cities and industrial centers has increased more than 50 per cent within the last year. This is chiefly due to the poor crops in 1915. This year, owing to careful fertilization and the more abundant supply of labor, afforded by war prisoners, together with more favorable climatic conditions, more abundant crops have been produced, and it is

hoped that the government will not experience too great difficulties in furnishing an adequate quantity of foodstuffs within the means of our laboring classes.

TRADE CONDITIONS.

Domestic trade has either been greatly curtailed or radically altered in character, while our foreign trade is greatly lessened. We cannot carry on normal business relations with the Americas and other countries beyond the seas, but trade is fair with Austria-Hungary, Bulgaria and Turkey. A regrettable development is that neutral countries, like the Netherlands, Scandinavia and Switzerland, to whom we can make deliveries, are neglecting our markets, obeying, doubtless, the demands of our island enemy.

RAW MATERIALS.

The blockade has stopped or greatly diminished the amount of raw materials, which we imported in vast quantities before the war, and such materials are scarce and very costly now that the stocks most manufacturers had in reserve have become exhausted.

As has been reported in previous letters, the government placed many restrictions upon the use of raw materials in manufacture. Production is limited on all articles except those needed by the government.

CRUDE RUBBER.

Although small quantities of crude rubber are constantly arriving, they have little or no effect on the market for this commodity. Prices continue very high, from 30 to 40 marks per half kilogram [\$7.14 to \$9.52 per pound], according to quality.

Reclaimed rubber and the artificial sorts also obtain very high prices, the latter being as costly as the natural product and finding a market only on account of the present abnormal conditions.

Rubber substitute sells at from 2 marks to 2.50 marks [49 to 60 cents] a pound.

Unusually high percentages of reclaimed, artificial and substitute rubber are being used in compounds for rubber goods for the army and navy. No crude rubber is allowed for private use, and substitute qualities are alone available for this purpose. Reclaimed rubber is used very extensively, mostly for military requirements, in spite of its quality, which is leaving more and more to be desired.

COLLECTION OF RUBBER WASTE.

The government has ordered that any quantity of rubber, either crude or vulcanized or reclaimed, exceeding 1 kilogram [2.20 pounds] in weight, is to be turned over to the concerns designated by the Rubber Clearing House. The names of these concerns were published in the August 1916 issue of THE INDIA RUBBER WORLD.

All rubber scrap must be sent to the nearest of these dealers and the cost of forwarding is refunded to the shipper. Rubber scrap is classed in 35 grades and payment is made according to the schedule published.

The least valuable grade is made up of cycle tire beads. Hard rubber is not purchased, nor is armored hose, except when the wire has been removed from the latter.

Rubber thread waste is paid for at the rate of 40 cents per pound; rubber footwear at 15 cents a pound; inner tubes fetch 70 cents, if soft and in good condition; if crusty, only 30 cents a pound.

The soldiers at the front are doing much good work in collecting waste rubber, as well as other kinds of waste materials.

These prices may appear extraordinary to your readers, but they must remember that we are living under conditions far from normal.

The cost of the war will be paid by future generations, and this burden will be only a slight reminder to them of the sacrifices and privations endured for them by their ancestors.

Rubber Planting Notes.

CRUDE RUBBER INDUSTRY IN BURMA

ACCORDING to a report from the Netherlands Consul at Rangoon, the total exports of crude rubber from Burma during the fiscal year 1915-16 amounted to 1,285,984 pounds.

The following table shows the area under rubber cultivation in Burma and the amount exported in the past five years, as given in the Report on Maritime Trade and Customs Administration of Germany.

Year	Area under cultivation in acres	Exports in pounds
1911-12	14,225	21,336
1912-13	14,225	21,336
1913-14	14,225	21,336
1914-15	14,225	21,336
1915-16	14,225	21,336

As a result of discussion at the beginning of the fiscal year 1915-16, between the Lieutenant-Governor of Burma and representatives of the Lower Burma Planters' Association, the rules regulating grants and assessments of land for rubber cultivation in Burma have been considerably modified. The planters represented that the extension of rubber growing was being hindered by the liability of rubber estates, leased under the rules then in force in lower Burma, to a land revenue assessment which might rise to as much as 25 rupees [83 cents] an acre.

Accordingly, a revision of rules was agreed upon, providing for the issue of grants instead of leases, and the levy of royalty on the net value of the rubber, combined with a moderate revenue assessment, instead of the previous liability to land revenue, the rates of assessment to be reconsidered every 20 years.

This new rule only affects lands granted for rubber cultivation on and after July 1, 1916. For land granted or leased under previous rules, certain abatements of royalty and land revenue assessments are allowed, and owners are offered the opportunity of surrendering their land at any time in the next ten years, and of taking out a grant under the new rules.

Experience is said to show that large areas in Burma are suitable for rubber cultivation, and the joint committee, formed to draft the foregoing rules, considers that an estate in full bearing should yield not less than 350 to 400 pounds of rubber per acre.

EXPORTS OF CRUDE RUBBER FROM MALAYA.

In his report for 1915, the Director of Agriculture, Federated Malay States, says: "The rubber crop for the Federated Malay States is returned at 36,380 tons, and to this must be added 6,666 tons from the unfederated states under British protection. It would probably be safe to add 8,000 tons for the colony, making a total of about 51,000 tons for Malaya. But it must be remembered that these returns only include properties of 100 acres or more area, and no account is taken of the output of rubber from small holdings. The export returns of the commissioner of trade and customs show that 44,523 tons of crude rubber were exported from the Federated Malay States in 1915. I have no reliable figures at present of the export of rubber from the colony and the other states of Malaya, but from

such facts as are available it is certain that it cannot be less than 24,000 tons, making a total export from Malaya of more than 68,000 tons."

CRUDE RUBBER EXPORTS FROM MOZAMBIQUE.

The American vice-consul at Lourenco Marquez, Portuguese East Africa, reports that the total exports of crude rubber from Mozambique during the year 1915 amounted in value to \$20,115.

CROP AND RAINFALL PERCENTAGES IN CEYLON AND MALAYA.

FRANK G. SMITH, secretary of the Rubber Growers' Association, London, England, has sent to the members charts and statements showing the percentages of crop

HEAVY LINE = CROP PERCENTAGES LIGHT LINE = RAINFALL PERCENTAGES

CHART SHOWING PERCENTAGE OF CROP HARVESTED, AND OF RAINFALL RECORDED MONTHLY IN 1914 AND 1915, BY REPRESENTATIVE ESTATES IN CEYLON AND MALAYA.

harvested, and of rainfall in 1913, 1914 and 1915, recorded monthly by a number of estates in Ceylon and Malaya. These are, as far as the two first-mentioned years are concerned, duplicates of the charts which were reproduced in THE INDIA RUBBER WORLD of January 1, 1916. The 1915 figures, together with those of 1914, are shown graphically on that portion of the charts reprinted here.

As in previous years, there is shown a very general resemblance or parallelism between the rainfall and the crop, though sometimes the fluctuations of the latter follow rather than coincide.

The Malaya chart shows great regularity in the movements of the crop curve during each of the three years.

The Ceylon chart for 1915 shows very clearly how the crop fluctuates with the variations in rainfall. It will be noticed, however, that the prolonged dry period from November, 1914, to February, 1915, had a much greater effect on the crop than the briefer dry spells in August and October, 1915.

Ceylon's heaviest yields in 1915 were August, 10.56 per cent; October, 11.30 per cent, and December, 13.72 per cent. March made the lightest showing, 3.62 per cent of the total crop. Malaya did not show such heavy fluctuations, the lowest yield being 6.33 per cent in April, and the highest 10.10 in December.

Taken as a whole, the graphic lines follow, in a general way, those of previous years, though the rainfall in Malaya at no time in 1915 reached as high a percentage in any one month as in the two previous years.

THE RUBBER TRADE IN MALAYA.

By Our Regular Correspondent

THE London rubber market has a grievance against Singapore, a grievance which is being voiced vigorously in the financial press. The complaint is that the Imperial Government, while forbidding the export of rubber from London to America and other neutral countries, allows the export from Singapore, with the result that Singapore is rapidly becoming the world's rubber mart and the London market is declining in importance. From the local point of view this is just as it should be. It is felt that Singapore is in every respect best suited to be the center of the world's rubber trade and the sooner it becomes recognized as such the better for the Straits Settlements and Malaya and the rubber industry as well.

When the war broke out Singapore had its great chance. Hamburg ceased to count, the London market scarcely knew what course to take, but Singapore had the rubber and the buyers, and the ability to ship east or west to the great centers of consumption. Now Singapore has the biggest open market in the world, and business can keep going without war restrictions. Moreover, freight conditions, to a large extent, force rubber from Java and Sumatra to pass through Singapore, where it is subject to the system of export permits adopted to check the export of British or other rubber to Britain's enemies.

The London dealers are greatly concerned, but it would seem that their efforts to check the development of the Singapore market have altogether failed. Even without the war, the decline of the London market was certain, though it would have been a longer process; but as things are, the pace at which Singapore has forged to the front has been wonderfully rapid. With exports practically free here, but restricted in London, the obvious policy is for the bulk of the sales to be made in Singapore, thus preventing shipments to London growing to an extent to cause a glut, and a consequent fall of prices.

London critics say further that by present arrangements Singapore is playing into the hands of German-Americans, whatever this may mean. It is mere clap-trap, however, for whatever German-American influences exist are much more effectively combated here than in London, according to local opinion, for in Singapore such movements are more easily watched and checked. It is certain that American capital is taking a lively interest in the rubber trade; indeed, it would be astonishing if this were not so, and owners of rubber plantations in Malaya, when they get definite offers for their property are not to be deterred.

to look at these propositions from a purely business point of view. The political question is one for statesmen. When it looks as if such sales might be harmful to national interests, it is for statesmen to step in and make such rules and regulations as are thought to be necessary. A rubber plantation remains British as long as it is on British soil, and is thus under the control of the British Government. The capital may be foreign, but the produce is here, and its disposal is thus under British control. There is plenty of German money in rubber plantations, but this does not help Germany to get rubber at the present time.

A recent report on the Federated Malay States showed that at the end of 1915 the total area of rubber estates of more than a hundred acres in extent was nearly 500,000 acres, of which the producing area was about 281,130 acres, an increase of nearly 66,000 acres on the previous year. The amount of rubber exported was 44,523 tons, of an estimated value of \$93,660,621 (the local dollar is worth 2s. 4d.). This was an increase of nearly 14,000 tons compared with 1914, and it is estimated that this year about 60,000 tons will be exported. It is to be noted that this is from the Federated Malay States alone, and there is an appreciable production in the Straits Settlements also.

Considerable comment has been aroused by a statement by a correspondent in a London financial paper to the effect that planters are taking advantage of the present abnormal times, when estate staffs are reduced to a minimum on account of so many men having joined the army, to try and force the hands of directors. It is alleged that they are sticking out for big increases in salary and highly favorable agreements under threat of throwing the work up, if their demands are not complied with. Correspondents have not been slow in taking up the cudgels on the other side, and on behalf of the planters it is pointed out that those who have stayed behind rather than accompany their comrades home to join up, would usually much rather be fighting than planting, and if all the men who wanted to go had gone, a good many estates would have come to a standstill.

It may be that some have asked for increased pay, but then, in a good many cases they are doing double work, which was not specified in agreements. Again, it must be remembered that before the war directors had things very much their own way. It was easy to get men with no previous experience to act as assistants on estates at a cheap wage, with the consequence that the rates of pay tended to go down, and often at the end of a four years' agreement, a man, if he was unable to get the management of an estate, found himself on the same level as a new man brought out from home, who had never seen a rubber tree before. The war is making a great many changes. If it renders cheap white labor an impossibility in the future it will have done one good thing.

RUBBER ADULTERATED WITH STARCH.

B. J. EATON, chemist of the Department of Agriculture of the Federated Malay States, reports in the "Agricultural Bulletin of the Federated Malay States" on a curious case of adulteration of rubber.

A peculiar specimen of rubber was received by Mr. Eaton from the Secretary of the Johore Planters' Association. It consisted of a thin sheet resembling a piece of drab-colored leather or hide. The rubber was easily torn and had a pure white interior, resembling flour. On examination the sample was found to contain a large quantity of starch, which was probably tapioca starch. It was found impossible to estimate the starch by washing it out on the crêping machine, the rubber refusing to cohere on the machine and becoming a mass of crumbs, the particles being washed through the sieves and lost. By boiling the rubber in dilute hydrochloric acid and subsequently in pure water and by crêping it on a small experimental crêping machine with hot water, a fairly coherent sample was obtained, which could be subsequently crêped and washed with cold water on an ordinary

factory crêping machine and converted into a thin crêpe on a factory sheeting machine. Even after this treatment the rubber resembled lace and was very weak. The loss on treatment, which probably consisted almost entirely of starch, was 50.9 per cent.

It had been previously reported to Mr. Eaton that starch, in the form of tapioca or sago, which is easily obtainable locally, was probably used by contractors' tapping coolies on estates where contract tapping exists. The managers of such estates pay on the wet weight of rubber collected, making an allowance for the water content of the sheet of rubber obtained, the sheets being weighed some time after being machined and hung to drain. If starch be used as an adulterant, it absorbs a large proportion of water and the manager pays not only for the added starch, but for water, since the wet sheets, on drying, lose much more weight than would normally be allowed for. The sample reported on was, however, the first in which starch had been discovered, although two suspected samples from another estate were received some time ago, in which no starch was found.

Mr. Eaton believes that the large amount of starch found in this sample, which was taken from a parcel of rubber from Johore consigned to Singapore and sold at the auctions there by a Chinese, would suggest that the adulterant was deliberately added for selling purposes.

This information should be a warning to planters who use contract tappers to look out for adulteration of this nature. It would probably be easily detected in sheet rubber when dry, but not in crêpe, since the starch would probably be almost entirely removed on the crêping machine, when fresh coagulum is washed.

Mr. Eaton suggests the use of the standard test for identifying the presence of starch, which is to add a few drops of a dilute solution of iodine to the suspected sample of rubber or latex, when a blue color will be produced.

[In connection with this report it is interesting to refer to the ancient practice of adulterating Brazilian rubber with flour or *farinha*, which is described at length in "The Rubber Country of the Amazon," by Henry C. Pearson.

In Para, the principal rubber market of Brazil, rubber houses employ a very capable body of men, who receive the rubber, cut and examine it, and pack it in boxes for shipment. The cutting of the rubber, he says, "is an absolute necessity, as some lots are badly adulterated. This adulteration takes three forms: In one, a substance, *tabatinga*, is added to the latex, giving a short-fibered rubber that is wholly without nerve. The second is the addition of *farinha*, which increases bulk and weight, and also makes the rubber very short and pasty. The third is a mixture of sand and *farinha*, which is, perhaps, the worst of all."

Mr. Pearson, in this book, tells us that the adulteration of fine Para by the addition of *farinha* was reported by Herndon as far back as the early '50s. "The gatherer does not put the *farinha* in altogether for the sake of adding weight; its presence causes a quicker coagulation, and if he gets a little too much he adds a little lemon juice and is able to produce exceedingly smooth films, free from bubbles, and very quickly."

"*Farinha*-adulterated rubber looks beautiful until red ants burrow into it and eat the *farinha* out. Then when the rubber *pelles* are cut open the whole fraud is apparent and the adulterated rubber is rejected. Sometimes the rubber is shipped before the ants get a chance at the *farinha*, and it is necessary for the rubber manufacturer to know whether it is there or not, as the strength of the rubber will show an extra shrinkage if it is present."

Mr. Pearson recommended a very simple test, which is to have a water solution of iodine and potassium iodide, which may be applied with a brush to the freshly cut surface. If *farinha* is there the surface will turn from a yellowish mahogany color to blue.]

FACILITIES FOR RUBBER TESTING IN THE EAST.

The Department of Agriculture of the Federated Malay States is now equipped to vulcanize, test and report on samples of rubber from any plantation estates.

Samples of rubber are sent to the Department of Agriculture, together with particulars of methods of preparation, and the results of tests are reported to the estate sending in the samples. No doubt these reports will be in the course of time published in bulletins for public information and benefit.

Mexican Rubber Notes.

THE position of rubber producing companies in Mexico, at the present time, is far from encouraging. Recent proceedings bring into prominence the insecurity of such enterprises in the United States. The affairs of two such companies serve to emphasize this.

PROPERTY SEIZED BY GOVERNMENT.

The Conservative Rubber Co. was incorporated under the laws of Arizona in October, 1901, the capital stock being \$1,200,000, consisting of 6,000 shares at \$200 per share. These were marketed on the monthly payment plan. The principal office is in San Francisco. The property consists of large tracts in the states of Tabasco and Chiapas, Mexico, in which there are some wild rubber trees, and on which the first planting of *Castilloa* trees was done in 1902. There are reports that the Carranza Government had seized the property of the company for unpaid taxes amounting to \$35, and that the company had lost its license to do business in California through failure to pay the corporation tax, and also, that the stockholders had been notified that owing to the political situation in Mexico, it would be better to lose the property and wind up its affairs. The shareholders, many of whom have bought shares on the monthly payment plan, have applied to the courts to prevent what they consider a plot to wreck the company.

CALLED FOR ASSESSMENT

La Zacualpa-Hidalgo Rubber Co. has recently called an assessment of 12½ cents per share. As this stock has been inactive for some time, and had been offered at about 30 cents a share, the assessment was a heavy one. The assessment was made to reimburse those stockholders who had advanced about \$56,000 to carry on the affairs of the company, and to continue to meet expenses.

This corporation, although not the oldest, is, perhaps, the largest rubber planting company in Mexico. It comprises 1,897 acres situated in the Department of Soconusco, in the State of Chiapas. A large portion of the tract is planted with *Castilloa* trees. Of the authorized capital of 800,000 shares, there were outstanding at the end of its fiscal year, February 29, 1916, 619,-

from 47 to 76 cents a pound, the net receipts being \$39,770.84 and on March 1 there were 72,000 pounds in the hands of its sales agents. The annual report showed receipts \$59,280.90 and disbursements \$45,857.75. Presumably, the balance and the \$56,000 mentioned above as advanced by some of the stockholders, has been absorbed by expenses since March 1.

"GRINGOS" OBLIGED TO GET OUT.

The following letter shows the discouraging position of some Americans connected with the rubber planting industry in Mexico. It reads:

TO THE EDITOR OF THE INDIA RUBBER WORLD:

Dear Sir—You will notice from this, that I am still making an effort to strive through the long-winded Mexican turmoil, but it looks very much as if all "Gringos" will have to get out, as we have now received a final message from the State Department, which is very urgent and to the point. I was in hopes of staying on, but from the rather serious conditions that now exist, I doubt very much as to the wisdom of it and, it is upon this account principally that I am writing to ask you about Central or South America. Do you know by any chance of an opening in my line down that way. I thought first of going into Guatemala temporarily, to await developments, with the idea in view of being near at hand, as I still have good interests here. What do you advise? Yours very cordially,

PIONEER.

OFFERS PRIZE FOR TAPPING PROCESS.

Another letter gives some insight into other difficulties which Mexican planters must face. This letter reads as follows:

TO THE EDITOR OF THE INDIA RUBBER WORLD:

Dear Sir—We have a property in Mexico of 1,200 acres of *Castilloa* rubber trees which are in excellent condition, except that for the last four years we have had to practically abandon them, and the tropical jungle has no doubt enveloped them. More than half of these trees were planted previous to 1909, beginning with 1904. In 1909 we had a fire in which probably three-fourths of our trees were burned. These afterwards grew up again from the stump, so that most of our property really dates from about 1909, 1910 and 1911.

You understand the difficulty that has been experienced in getting a successful method of tapping the *Castilloa* tree. Experiments that we have made and that we have known of, lead us to believe that there is an ample supply of latex in these trees to yield a handsome profit if a proper method of tapping can be devised. What we would like to do is to create an interest in investigation and experimentation along this line. If the Mexican Government were up-to-date it should be the party to foster investigation and to offer incentives for this work, but that is out of the question. We fortunately have ample funds and while I have not consulted with the other officers of our company personally, I would favor offering a reward of a sufficient amount to induce people who are in position to do it, to work and experiment along the lines of inventing or discovering a tapping system. If other people who have similar interests are in position to do it, it would only be fair that the burden of this be divided. However, I think there are few rubber planters, or former rubber planters in Mexico, who have much in the way of rubber trees, let alone much money, to do anything with. If a number of concerns could join together they could make the reward larger and thus offer greater inducements to effort.

Do you think that an offer of a reward of \$500 or \$1,000 would stimulate effort in this direction, and would you be will

Castilloa TREES ON LA ZACUALPA PLANTATION.

597⅓ shares of stock at a par value of \$3,097,988. The estate is equipped with modern improved machinery for the preparation of the product for the market, and last year produced 143,700 pounds of rubber. About one-half of this was sold during the year at

ing to take hold of the project and give it publicity? Could you put us in touch with others who are interested and who might be willing to join in the project?

Yours truly, PLANTER.

THE RUBBER TRADE IN BRITISH GUIANA.

By Our Regular Correspondent.

THE steady progress that is being made by the Consolidated Rubber and Balata Estates, Limited, as revealed by the report and the chairman's speech at the annual meeting held on June 27 in London, should prove a source of gratification to all who take wide views of the industrial situation in the Guianas. The operations of this company play no small part in British Guiana's commercial fortunes, and its progress is anxiously watched by a larger circle than a mere collection of investors looking for dividends, since the industry provides lucrative employment for a large portion of the laboring classes, and consequently makes a useful contribution to the trade of this colony. Therefore, the information contained in this report that the company is each year acquiring a greater measure of stability is exceedingly refreshing, when it is to be remembered the many vicissitudes through which it has passed. For seven years has it been in existence and not yet has the industry been sufficiently prosperous to return a dividend to the ordinary shareholders, and there are still a certain amount of arrears to pay off upon the preferred shares. But the company has passed through the worst of its difficulties, and is now entering upon the profit-earning stage, and its future, unless some very unfortunate calamity occurs, will be roseate.

In 1913 the profits amounted to \$1,310 only; in 1914 to \$59,890, and in 1915 to \$77,945. These profits are still only sufficient, after applying \$10,000 to reduction of preliminary expenses account and carrying forward \$6,085, to pay a dividend of 5¼ per cent on the 7 per cent preferred shares. But the improvement in the company's position that has manifested itself recently is of such a consistently upward nature as to leave very little room for doubt that a prosperous future awaits the enterprise. Much that has been achieved is due to the cautious and skilful management of the local attorney, A. F. White, who, with so many obstacles in the way, has landed the concern on a bed-rock footing.

The mill-stone of the balata companies which participated in the boom of 1910-11—the cost of prospecting—has practically disappeared from the neck of the Consolidated, the cost of this item being only \$3,375 in 1915, against \$22,770 in 1914, and \$41,390 in 1913. This, as the chairman pointed out, is exceedingly satisfactory. Still more encouraging is it to read that the prospective collections for this year are even better than they were in 1915, in which year they were quite good, and would have brought handsome returns to the company, had the market been in a more settled condition. The chairman stated that "already an early spring crop of quite respectable dimensions has been gathered; in fact, a larger spring crop than we have ever succeeded in securing before," and that all expeditions for the summer collections had been sent out. "The prospects for this year are satisfactory, and, given favorable weather—a factor of great importance—we shall hope to obtain greater results which will show continued progress for the company."

Thanks to the Crown Lands Regulations at British Guiana, the balata industry is not one that is likely to be killed out by overworking it, for the health and life of the trees are safeguarded and insisted upon by the government, and providing the regulations are observed, the industry will be maintained for years.

The most important part of the chairman's speech, however, is that part which deals especially with the rubber industry. Mr. Tayler spoke in figures that will come as a surprise to many, especially to those who are accustomed to think of rubber grow-

ing in these parts in very humble terms. On the Aruka plantation 317 acres are under cultivation, and 20,000 trees are planted. The estate comprises 1,000 acres and it is being cleared and planted year by year with *Hevea Brasiliensis*. On the Koriabo estate, 106 acres are planted, and on the Alike and Wycarabee estates 252 acres are planted. On the whole of the company's rubber properties 60,000 trees are planted, of which about 20,000 are tappable this year, 30,000 in 1917 and 47,000 in 1918. The production in 1915 was only 4,500 pounds, but most of the preliminary work has now been undertaken, and the colony's rubber exports should increase rapidly.

In a quiet way the Consolidated company has laid the foundations for a promising rubber industry for British Guiana, and when in the years to come, rubber estates are dotted all over British and Dutch Guiana, the sterling work of this pioneer company should not be forgotten.

I am tired of preaching the possibilities of rubber in these parts, and consequently am the more glad to welcome the practical demonstration that is now being given by the Consolidated. This company is pursuing a sound financial policy, paying the arrears of interest, and retaining as much capital as possible in its possession to carry on the large schemes of development which are just beginning to bear fruit. As the chairman said, the directors, seeing the possibilities of British Guiana, are looking far ahead, and there can be no doubt that they are laying part of the foundations of the future prosperity of the colony. For that reason alone, their progress should be watched by every interested party with the keenest of sympathetic interest.

ADDITIONAL SURTAX ON IMPORTS INTO PARAGUAY.

A law enacted February 17, 1916, provides that all articles imported into Paraguay shall be subject to an additional surtax of 1½ per cent ad valorem (based on official valuations prescribed by the customs tariff), while on all exports an additional surtax of 1 per cent ad valorem is to be imposed.

REGISTRATION OF TRADE-MARKS IN LATIN-AMERICAN COUNTRIES.

The importance of early registration of trade-marks used in commerce with Latin-American countries cannot be overlooked by American rubber manufacturers.

In 1915 the Bureau of Foreign and Domestic Commerce, Department of Commerce, Washington, D. C., issued a report describing briefly the formalities of registration, and also indicating the offices to which applications should be directed, the duration of protection, and the principal official fees. A revised edition of this publication, which is entitled "Tariff Series No. 31, Registration of Trade-Marks in Latin-America," with corrections to date, has been issued, and copies can be obtained upon application to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its district offices. Information regarding countries that are not covered by this publication may also be obtained by addressing the Washington office of the Bureau.

SCANTY YIELD FROM WEST INDIAN SAPODILLA.

Attention has been drawn to the fact that the Sapodilla tree (*Achras Sapota*) grown in the West Indies, although supposed to be of the same species as that grown in Central America, does not yield as freely as the latter. A thorough tapping of a 20-year-old tree 39 inches in girth at three feet from the ground yielded 3½ fluid ounces of latex, which gave 1¾ ounces of chicle. This gum was submitted to one of the largest chewing gum manufacturers in America, who stated that it could be marketed to advantage here, but the low yield of the gum as compared with that secured from Mexico and Central America renders it doubtful whether its collection would be profitable. The chief value of the tree in the West Indies lies in its excellent fruit, which, it is said, might be still further improved by careful selection experiments. [Report of the Agricultural Department, Dominica, British West Indies, 1914-1915.]

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED AUGUST 15, 1916.

- N**O. 1,194,393. Water closet seat comprising a core of laminated wood and a veneer of hard vulcanized rubber. M. L. Adler, New York City, assignor to the Brunswick-Balke-Collender Co., Chicago, Ill.
- 1,194,408. Packing comprising four plies of a single strip of fabric impregnated with rubber, and an intermediate endless wire strand. R. B. Meany, Weehawken, N. J., assignor to Peerless Rubber Manufacturing Co., New York City.
- 1,194,428. Reinforced pad for shoes. L. S. Samuel, Newark, N. J.
- 1,194,651. Rubber tired vehicle wheel. J. M. McPheeters, Palo Alto, Calif.
- 1,194,681. Tire armor. A. Szkoknya, Chicago, Ill.
- 1,194,704. Wearing surface for conveyor belt comprising layers of fabric united by rubber and vulcanized. W. F. Bowers, San Francisco, Calif.
- 1,194,732. Rubber and canvas sole for bathing and outing shoes. W. Greulich, Brooklyn, N. Y.
- 1,194,789. Sectional cushion tire. J. Spyker, Amsterdam, Netherlands.
- 1,194,790. Resilient wheel. J. Spyker, Amsterdam, Netherlands.
- 1,194,793. Hose connection. H. V. Styers, Warwick, N. Y.
- 1,194,797. Tire for vehicle wheels. F. S. Weise, Baltimore, Md.
- 1,194,854. Demountable rim. W. T. McLean, assignor of one-half to G. W. Lyndon—both of Chicago, Ill.
- 1,195,023. Inflatable figure in marionette baseball performance toy. T. H. Jackson, Scranton, Pa.
- 1,195,036. Elastic fabric. C. A. Lapworth, West Bridgewater, assignor to The Lapworth Webbing Co., Brockton—both in Massachusetts.
- 1,195,117. Device for removing wrinkles. M. Spellerberg, Berlin-Friednau, Germany.
- 1,195,125. Fountain pen. E. Winne, New York City.

ISSUED AUGUST 22, 1916.

- 1,195,327. Inside heel cushion of sponge rubber. J. W. Arrowsmith, Morristown, N. J.
- 1,195,354. Garter or hose supporter. R. K. Guinzburg, assignor to I. B. Kleinert Rubber Co.—both of New York City.
- 1,195,365. Life preserving garment with inflatable portions. J. Krem, Philadelphia, Pa.
- 1,195,512. Tire for wheels and means for retaining the same. E. H. Schwarz, New York City.
- 1,195,556. Resilient tire. T. L. Carbone, Charlottenburg, Germany.
- 1,195,580. Hose coupling. F. Hachmann, assignor of one-fourth to F. C. Schoenthaler—both of St. Louis, Mo.; one-fourth to J. Merz, and one-fourth to G. S. Haskell, Chicago, Ill.
- 1,195,621. Catamenial napkin. E. Sprague, Minneapolis, Minn.
- 1,195,640. Antiskidding device for vehicle wheels. S. Baruch, New York City.
- 1,195,709. Fountain pen. L. J. Most, New York City.
- 1,195,735. Vehicle bumper comprising a block of rubber. F. T. Roberts, Trenton, N. J., assignor to The Paramount Rubber Co., Cleveland, Ohio.
- 1,195,913. Tire armor. E. B. Curry, Payson, Ill.
- 1,195,931. Surgical appliance comprising pneumatic knee pads. J. L. Sowell, Jasper, Ala.
- 1,195,939. Valve attachment for pneumatic tires and the like. C. E. Baker, Carmarthen, Wales.

ISSUED AUGUST 29, 1916.

- 1,196,069. Vehicle tire. L. F. N. Baldwin, Cranston, R. I.
- 1,196,250. Aseptic appliance comprising a sheet of comparatively thick rubber. A. O. Kuhn, San Francisco, Calif.
- 1,196,539. Air-purifier comprising rubber tubes. E. I. Goldberg, New York City.

- 1,196,604. Vehicle wheel rim. C. H. Snyder and E. Stallter, Rockford, Ohio.
- 1,196,608. Rubber heel. J. F. Standish, Winthrop, Mass., assignor to United Shoe Machinery Co., Paterson, N. J.
- 1,196,649. Rubber figure toy. L. A. Bockstahler, Cleveland, Ohio.
- 1,196,678. Garment supporter. L. A. Griswold, Dayton, Ohio.
- 1,196,680. Hose coupling. H. Handoll, London, England.

ISSUED SEPTEMBER 5, 1916.

- 1,196,800. Elastic strip in skirt band. B. F. Miller, Philadelphia, Pa.
- 1,196,817. Tube for storage battery plates having its inner part of rubber material containing finely divided lamp black and its outer part of relatively pure hard rubber. E. W. Smith, Philadelphia, Pa.
- 1,197,011. Combined nursing bottle and breast pump. F. Cilinc, Pueblo, Colo.
- 1,197,115. Submarine life-preserver. G. E. Fell and G. A. Fell, Buffalo, N. Y.; said G. E. Fell assignor to said G. A. Fell.
- 1,197,118. Solid tire with an inner annular opening. B. A. Godek and I. Benjamin, Paris, France.
- 1,197,236. Rain-proof garment. M. Schnur, New York City.
- 1,197,266. Syringe. J. E. Cox, assignor of one-half to J. F. Brown—both of Chicago, Ill.
- 1,197,312. Storage-battery separator. H. Weida, Highland Park, assignor to The India Rubber Co., New Brunswick—both in New Jersey.
- 1,197,368. Hose-supporter with rubber button. C. J. Hausen, New York City.
- 1,197,432. Cushion tire tube. R. J. Bartholomew, Lorton, Mo.
- 1,197,454. Diving apparatus. W. Deuter, Wells, Minn.
- 1,197,493. Armored tire. G. L. Hurd, Tenaflly, N. J.

ISSUED SEPTEMBER 12, 1916.

- 1,197,587. Tire comprising a body of rubber and tread layer of fabricated fibrous material. H. R. Auld, Boston, assignor to G. E. Carr, West Roxbury—both in Massachusetts.
- 1,197,670. Life saving suit. F. Schlachter, Decatur, Ill.
- 1,197,719. Demountable wheel rim. H. E. Doebler, Cannon Falls, Minn.
- 1,197,768. Locking device for demountable rims. R. J. Schone, St. Charles, Mo.
- 1,197,805. Compression inner tube for a double tube tire. N. C. Doss, Rome, Ga.
- 1,197,814. Vehicle-wheel rim. F. A. Frommann, assignor to O. Frommann—both of Chicago, Ill.
- 1,197,823. Life saving suit. R. E. Hervey, Wallace, Idaho.
- 1,197,863. Gasket of rubber compound for hose couplings. E. A. Schreiber, assignor to Chicago Car Heating Co.—both of Chicago, Ill.
- 1,197,911. Rubber sole shoe welt of hard and soft rubber. Le B. C. Colt, assignor to National India Rubber Co.—both of Bristol, R. I.
- 1,197,913. Rubber sole shoe welt of hard and soft rubber. Le B. C. Colt, assignor to National India Rubber Co.—both of Bristol, R. I.
- 1,197,987. Pneumatic tire casing with inner supporting frame. A. Winick, Jacksonville, Fla.
- 1,198,071. Vehicle-wheel with interposed pneumatic tube and a tire. M. C. Sharpnack, assignor of one-half to B. F. Goodwin—both of Prescott, Ariz.
- 1,198,104. Locking means for demountable wheel-rims. J. P. Burger, Cleveland, Ohio.
- 1,198,176. Massage device. L. J. Widness, New York City.
- 1,198,240. Tire having a tread and base of elastic rubber. A. S. Krotz, Janesville, Wis.
- 1,198,242. Demountable rim. U. S. Lande, S. Bakersfield, Calif.
- 1,198,267. Attachment for pneumatic tire valves. C. G. Spencer, East Orange, N. J.
- 1,198,317. Demountable rim for vehicle wheels. F. P. Blubaugh, Fort Scott, Kan.
- 1,198,366. Golf and other playing ball. P. A. Martin and J. Stanley, Birmingham, Eng.
- 1,198,384. Rubber bulb. T. W. Miller, assignor to The Faultless Rubber Co.—both of Ashland, Ohio.

THE DOMINION OF CANADA.

ISSUED MAY 31, 1916.

- *169,199. Sleeping garment having elastic section and straps. F. J. Blenis, Valhalla, N. Y.
- *169,360. Rubber sole protecting device to be adjusted to the shoe by means of clamps and straps. J. C. Hocker, Barnard, Mo.
- *169,494. Inflatable horse collar. J. Baarson and A. Thorson, Odin, Minn.
- *169,536. Anti-skid device. W. Grus, Jr., Chicago, Ill.
- *169,595. Rectal syringe. C. A. Tyrrell, New York City.

*Denotes patents for American inventions.

- *169,612. Cushion heel for automobile wheel. J. G. Putnam, Elvira, Ohio.
 *169,647. Auxiliary tread for automobile wheel. M. W. Dadey and F. Sellberg, Winslow, Ariz.
 169,669. Life saving device. J. I. Edmund, Clear Lake, Alberta, Canada.
 *169,581. Flesh rubber shoe with elastic sole. I. W. Rogers, Columbus, Ohio.
 *169,675. Resilient wheel comprising a solid rubber tire. A. Freund, St. Louis, Mo.
 *169,705. Life preserver comprising a collapsible body adapted for inflation. J. E. Lomas, Smuggler, Colo.
 *169,719. Massage glove. W. R. Norton, Hightstown, N. J.
 169,732. An air inflated tire. J. Anderson Simpson, Toronto, Ontario, Canada.
 169,733. Weather strip. S. I. Smith, Vancouver, British Columbia, Canada.
 *169,765. Hose support. The Robert N. Bassett Co., Huntington, assignee of F. A. Kush, Greenwich, and H. J. Stuart, Derby, all in Connecticut.
 *169,832. Cooler for pneumatic tires. P. J. Cuddihy, Rutherford, N. J.
 *169,847. Automobile tire. T. H. Griffiths, Toronto, Ontario, Canada.
 *169,900. Rubber sheet with flame attachment. C. English, Stalter, Howell, Mich.
 *169,766. Button clasp. The Robert N. Bassett Co., Huntington, assignee of H. J. Stuart, Derby—both in Connecticut.

ISSUED JUNE 30, 1916.

- 169,943. Balata and leather belting. James Dawson & Son, Limited, Boultham, assignee of A. Waddington, Lincoln—both in England.
 169,999. Pneumatic tire cover. P. J. Borbridge, Ottawa, Ontario, Canada.
 170,018. Hose armor. H. W. Goodall, Alden, Pa.
 170,020. Rubber footwear with reinforced heel. L. J. Grosky, Cleveland, Ohio.
 170,029. Rubber glove. J. Hopkins, North Attleboro, Mass.
 170,058. Automobile floor mat. G. F. Foss, Montreal, Quebec, Canada.
 170,070. Lining for brake shoes. R. J. Stokes, Trenton, N. J.
 170,081. Pneumatic tire alarm. G. F. Young, Indianapolis, Ind.
 170,102. Artificial test. Dixon Wilson, Limited, assignee of W. E. Dixon—both of Toronto, Ontario, Canada.
 170,152. Composite waterproof material for shoe soles. G. F. Butterfield, West Newton, Mass.
 170,192. Vehicle tire comprising a pneumatic tube and metal cover. J. P. Marois, Montreal, Quebec, Canada.
 170,266. Automobile tire comprising a rim, casing and tread. J. W. Ostman and C. Gustafson, assignee of a one-third interest both of Winnipeg, Manitoba, Canada.
 170,290. Plug for rubber heels. F. Berenstein, Chelsea, Mass.
 *170,297. Fountain syringe. G. W. Brown, Maynard, Mass.
 170,469. Artificial foot. O. L. Savitz, Allentown, Pa.
 170,480. Rubber heel. J. M. Van Housen, Boston, Mass.

THE UNITED KINGDOM. PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 9, 1916.]

- 5,665 (1915). Manner of joining wire rings vulcanized in the edge of pneumatic tires. G. E. Birmingham and D. Moseley & Sons, Chapelfield Works, Chapelfield Lane, Ardwick, Manchester.
 *5,790 (1915). Fountain pen. W. J. Ferris, 525 Lawrence avenue, Westfield, and E. F. Britten, 21 Van Reipen avenue, Jersey City—both in New Jersey.
 5,858 (1915). Wire embedded rubber sole for attachment to a shoe by means of hooks and straps. R. M. Withycombe, "Wyoming," Macquarie street, Sydney, New South Wales, Australia.
 5,872 (1915). Rubber strips in saddle girths and surcingles. A. C. Gull, Serpentine, and C. Watson, Barrack street, Perth both in Western Australia.
 5,926 (1915). Sealing closure for glass containers comprising rubber gasket. F. C. R. Marks, 57 Lincoln's Inn Fields, London.
 5,933 (1915). Inflatable shoe for the stump-receiving socket of an artificial limb. A. E. Tullis, 12 Tenth street North, Fargo, N. Dak.
 5,985 (1915). Waterproof overall stocking. J. W. Price, Upper Canada Apartments, Lonsdale Road, and R. H. Howard, 13 Ferndale avenue—both in Toronto.
 100,642. Segmental tire. P. E. van Berendonck, 38 Avenue Jeanne, Brussels.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 16, 1916.]

- *6,000 (1915). Sock suspenders. G. B. Gilden, Centre street, Dighton, Mass.
 6,255 (1915). Wheel tire with hard rubber tread. W. Freakley, 86 Wellesley street, Shelton, Stoke-on-Trent, and H. Aynsley, Portland House, Blythe Bridge—both in Staffordshire.
 *6,281 (1915). Puncture proof band to be secured to the inner side of a tire. C. V. Roberts, Ocala, Fla.

* Denotes patents for American inventions.

- 6,337 (1915). Rubber handles for tennis rackets, etc. B. C. Bart, 319 Kingston Road, Merton Park, Wimbledon, Surrey.
 100,734. Cover for preventing bursting of a diving dress when inflated. H. Drägerwerk and B. Dräger, 53 Moislinger Allee, Lubeck, Germany.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 23, 1916.]

- 6,390 (1915). Window fly-screen comprising a strip of rubber. S. Brentnall, 150 Drake street, Rochdale, Lancashire.
 6,465 (1915). Sleeping-bag comprising an outer waterproof casing. N. Richardson, 17 Finsbury Court, Finsbury Pavement, London.
 6,487 (1915). Fountain pen having a collapsible ink sac. C. Pressland, "The Sub," Hampton-on-Thames, Middlesex.
 6,557 (1915). Toy submarine comprising two elastic bulbs. A. G. Jones, 5 Acacia Road, Norbury, London.
 6,570 (1915). Fountain pens. A. Munro, 117 Birchfield Road, Handsworth, Birmingham.
 6,583 (1915). Solid tire with rubber cushions. A. D. Macropoulos, 15 Great St. Helens, London.
 6,585 (1915). Helmet with rubber securing bands. M. C. Favre, Neuilly-sur-Seine, Paris.
 100,755. Pneumatic arm-pit supports for the heads of crutches. F. A. Pennington, 10 Halesden Road, Heaton Chapel, Stockport, Cheshire.
 100,759. Tread bands for wheel tires. H. M. Hillman, 743 McMillan avenue, and J. Schwab, 434 Stradbroke avenue—both in Winnipeg, Canada.
 100,764. Rubber ends for wire garment stiffeners. F. Kleemann, 23 Moor Lane, London.
 100,786. Segmental cover for pneumatic tires. P. E. van Berendonck, 38 Avenue Jeanne, Brussels.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, AUGUST 30, 1916.]

- 6,866 (1915). Wristlets of elastic and elastic webbing. J. P. N. Casey, 44 Bloomsbury street, London.
 *6,987 (1915). Armored tread for pneumatic tires. A. Gorecki, 144 Coit street, Buffalo, N. Y.
 7,085 (1915). Rubber lining for cavities in closet seats. O. Imray, 29 Southampton Buildings, London.
 7,148 (1915). Rubber ring for washing plunger. E. A. Cloud, 9 Stile Hall Mansions, Chiswick, London.
 7,163 (1915). Vulcanite cigarette holder. H. E. Collett, Lombard Lane, Plydell Court, Fleet street, London.
 *100,811. Spring wheel with rubber ring and rope tread. M. Chupka, 164 Vaughan street, Johnstown, Pa.
 *100,838. Metallic inner tube. W. F. Stewart, 706 Park avenue, Pekin, Illinois.

NEW ZEALAND.

- 36,411. Pneumatic tire. E. W. B. Carey, Auckland, N. Z.
 37,436. Rubber heel and sole. T. H. Robinson, 2 Grosvenor place, off Drummond street, Carlton, Vic.

ISSUED JULY 6, 1916.

- 37,383. Pneumatic tire. M. S. Stevenson, 119 Victoria street, Westminster, London, England.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 479,886 (March 2, 1915). Armored tire without air tube, for vehicle wheels. A. Masetti Zannini.
 479,891 (September 29). Elastic wheel for vehicles. E. Haussmann.
 479,895 (September 30). Improvements in buffer springs, tractor springs and others, made with rubber. F. Spencer.
 479,897 (September 30). Rubber heel. The Goodyear Tire & Rubber Co.
 479,906 (October 2). Pneumatic tire. Reliance A. C. Co., Inc.
 479,969 (October 8). Air chamber for pneumatic tires. H. C. Boggs.
 479,981 (October 11). Wheel with pneumatic tire for vehicle wheels. W. H. Burritt.
 479,988 (October 12). Improvements in the manufacture of pneumatic tires. H. Agha.

TRADE-MARKS.

THE UNITED STATES.

- 64,341. The word EFFICIENCY—hose, tubing, belting, gaskets, valves, packing. Imperial Rubber Co., New York City.
 79,119. The word NARCO—waterproofing composition for inner tubes, patches, and rubber repair stock generally. National Rubber Co., St. Louis, Mo.
 96,128. An illustration of the words STICK-TITE—tire patches. Auto Supply Manufacturing Co., Eau Claire, Wis.
 96,291. The words RELIANCE DE L'UNE water bottles, fountain syringes, etc. The Faultless Rubber Co., Ashland, Ohio.
 96,484. The letter S with the letters TERILI within—syringes, etc. B. F. Calley, Denver, Colo.
 96,772. The word HALLMARK—fountain pens and parts thereof. The United Jewelers Inc., New York City.
 71,150. Illustration of a high boot, the narrow upper band colored red—rubber boots, rubber shoes, rubber shoe-packs, and rubber shoes with leather tops. The B. F. Goodrich Co., New York City and Akron, Ohio.
 96,213. The word PEARL—golf and other playing balls. Martins Birmingham, Limited, Birmingham, England.
 96,403. An illustration within a circle, of a boy protecting himself in a shower with rubber matting—rubber matting. The Federal Rubber Co., Cudahy, Wis.

- 89,981. The representation of a section of packing on which is arranged the word CHANELCO—rubber and rubber and fiber packings for the piston rods of engines and pumps. R. L. Henry, New York City.
- 96,534. The word STAG—autobile tires, inner tubes, etc. Times Square Automobile Co., New York City.
- 96,559. The word TRAFFIK—tire treads. The Federal Rubber Co., Cudahy, Wis.
- 96,821. The word INTERNATIONAL belting, made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,822. The word DREADNAUGHT belting, hose and machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,823. The word KORTLANDT—belting, hose and machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,824. The word CENTAUR—belting and hose made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,825. The word PROSPECTOR belting made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,827. The word YEOMAN—belting made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,835. The word VIKING—hose and machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,838. The words WHITE JACKET—hose made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,839. The word MOHICAN machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.
- 96,840. The words "GOLDEN FLEECE"—machinery packing made of flax. The Manhattan Rubber Manufacturing Co., New York City.
- 96,841. The word CARDINAL—brakelining made partly of asbestos and partly of rubber, and machinery packing made of composite rubber. The Manhattan Rubber Manufacturing Co., New York City.
- 96,842. The word RAVEN—composite rubber packing. The Manhattan Rubber Manufacturing Co., New York City.
- 96,843. The word HEADLIGHT—machinery packing made partly of flax and partly of rubber. The Manhattan Rubber Manufacturing Co., New York City.
- 64,341. The word EFFICIENCY—mechanical rubber goods. Imperial Rubber Co., New York City.
- 91,088. The word NURSWEET—nursing-nipples. The Vant Woud Rubber Co., Brooklyn, N. Y.
- 96,693. The word PEN-F-ZIP—toy balloons. The Miller Rubber Co., Akron, Ohio.
- 96,803. An illustration of a shield with the monogram THE R. P. Co.—seamless fountain syringes and no seam water-bottles. The Rubber Products Co., Barberton, Ohio.
- 90,288. The words "GRAFINITE" TUBE—inner tubes or air tubes for vehicle tires.
- 95,043. The word KELMAN—asbestos, metal, rubber and cotton machinery packing; belting and hose. R. Kelly, New York City.
- 95,675. The word WONDERNET abdominal belts made of rubber, cloth, and combinations of rubber and cloth. Kups Bros., New York City.
- 95,942. The word NAUGASOLE—boots and shoes having rubber or composition rubber and fiber soles attached thereto by vulcanization. The Goodvear's Metallic Rubber Shoe Co., Naugatuck, Conn.
- 96,505. The word BRIGHTON—suspenders, belts and armbands. Pioneer Suspender Co., Philadelphia, Pa.

THE DOMINION OF CANADA.

- *21,723. The word PORTAGE rubber tires. The Portage Rubber Co., Barberton, Ohio.
- 21,746. The words GAME BRAND and the representation of a partridge—soft rubber goods, such as vehicle tires, tire tubes, water bottles, tobacco pouches, etc. The F. E. Partridge Rubber Co., Montreal, Quebec, Canada.
- *21,780 The word "SILVARK" water-proof fabrics and waterproof garments. C. Kenyon Co., Brooklyn, N. Y.

THE UNITED KINGDOM.

- 371,437 The words JOHN BELL rubber erasers. St. Mungo Manufacturing Co., Govan, Glasgow.
- 371,648. The word KURSPIN—golf balls, golf clubs and golf bags. Wood Milne, Limited, Ribbles Banks Mills, Preston, Lancs.
- 371,658. Two concentric circles traversed by an arrow and bearing the words "TRADE-MARK" and "WOOD-MILNE"—pumps and tire inflators; artificial leather for soles and heels of boots and shoes; tire inner tubes; tips, pads for boots and shoes; all made of rubber. Wood-Milne, Limited, Ribbles Banks Mills, Preston, Lancs.
- 372,101. The word PETRIX vulcanized rubber sheets, springs, washers, valves, buffers and similar goods. Anderson, Anderson & Anderson, Limited, 35 Saint Paul's Churchyard, London, E. C.
- 372,102 The word RUBREX—goods manufactured of rubber and gutta percha. Anderson, Anderson & Anderson, Limited, 35 Saint Paul's Churchyard, London, E. C.
- 372,103. The word VULKEK—vulcanized rubber sheets, springs, washers, valves, buffers and similar goods. Anderson, Anderson & Anderson, Limited, 35 Saint Paul's Churchyard, London, E. C.
- 372,122. The word WIZARD—apparatus for vulcanizing tires. J. B. Auto-Specialties Co., Croydon, Surrey.

- 372,161 The word SOLAX balata material to be employed in the manufacture of soles for boots and shoes. Norman Isherwood & Co., Limited, Bolton, Lancs.
- 372,193. The word REGENT—balata goods, not including tires and belting. Cohen & Wilks, Cheetham, Manchester.
- 372,727. The word CLINCHER—all rubber goods included in class 9. The North British Rubber Co., Limited, Castle Mills, Edinburgh.
- 372,837 The word BALCOT—balata belting. The Manchester Balata Belting Co., Limited, Liverpool.

THE FRENCH REPUBLIC.

54. A cannon with the figure 75—rubber tobacco pouches. Eugène Rofl, Baume les-Dames.
- 16,875. A banner placed horizontally and made up of the several flags of the Entente Allies. Madam Rose Ducassou, Marseille.
- 16,896. The figures 14-15—rubber goods. Marie Louise Faret, Marseille.
- 16,897. The figures 1914 1915 Same.
- 16,898. The figure 11— Same.
- 16,899. The figure 1914 Same.
- 16,921. The words Y A BOA rubber goods. Ferdinand Gunaud, Marseille.
- 16,922. The word PACIFIC— Same.
- 16,923. The word MAGARD— Same.
- 16,924. The word ATLANTIC— Same.
- 16,925. The words SAINT JAMES— Same.

Review of the Crude Rubber Market.

Copyright, 1916.

NEW YORK

THE demand for crude rubber during September has not been large enough in volume to affect the steady market conditions that have generally prevailed. The arrivals have been heavy this month in comparison to August receipts, which were small, due to the delays in transit and congested shipping. Guaranteed deliveries from London are placed at 40 days, and from the Far East three or four months are required. It would seem that under these prevailing conditions a large and immediate demand could not be supplied. There has been a fair demand for plantations, and the tone of the market is steady, with fluctuating prices, First latex showing a gain of about 3 cents during the month. The theory that the large buyers are in control is supported by advanced quotations when orders are placed in London. Upriver fine has been the feature of the month. The shortage is evident, despite the heavy arrivals. Spot prices have fluctuated from 70 cents to as high as 75 cents within the month, and on September 29 the figure was 73 cents in an easier market. Futures were quoted: October-November, 71 cents; November-December, 70 cents.

According to official figures recently issued by the Department of Commerce, 119,542 tons of crude rubber were imported into the United States during the fiscal year ended June 30, 1916, as compared with 76,816 tons in 1915 and 58,926 tons in 1914.

LONDON.

The steady increase of stocks and the approaching period of heaviest arrivals would forecast easier conditions in London. The cost to holders may necessitate their unloading, which undoubtedly would be followed by weak market conditions. The cause of these accumulations is said to be the refusal of producers to sell forward. Price advances have not been followed up, as buyers are satisfied to take chances with a large crop in view. There is some speculation as to accumulated supplies available from East Africa, which has recently become a British possession.

On September 5 the market was firm and quiet, Standard crêpe being quoted at 53 cents and smoked sheet 52½ cents. Steady and quiet conditions prevailed during the month, and on September 25 Standard crêpe was 57 cents and Smoked sheet 56½ cents.

PARA AND MANAOS.

The trade has been elated over the upward movement of Upriver fine that featured the September market. Later in the month prices eased off, but the scarcity of stocks, particularly Upriver fine, was still apparent. The actual cause of this movement is unknown; however, there are certain facts which undoubtedly have been generally effective. For instance, the rivers were abnormally low and supplies consequently delayed. Russia has been in the market for considerable supply. The production of Caucho has increased and Upriver fine has decreased during the year, as is indicated by the following table:

PARA ARRIVALS FOR AUGUST, 1915-16

	August, 1915.	August, 1916.
Islands, fine	412	404
Upriver, fine	1,313	1,176
Caucho	315	420
Totals	2,240	2,300

SINGAPORE.

At the auction held September 1, 8, 15 and 24 about 1,500 tons were sold. First latex crêpe brought an average of 51 cents and Smoked sheet 51½ cents a pound.

COMPARATIVE NEW YORK PRICES FOR SEPTEMBER.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"A good demand for Commercial Paper in the rubber line has continued this month, the best names going at 4½ to 4¾ per cent., and those not so well known 5 to 5½ per cent. city and out-of-town buyers."

	1916.*	1915.	1914.

*Figured only to September 25.

SINGAPORE.

GUTHRIE & CO., LIMITED, report [August 16, 1916]:

At the auction held today prices declined on the average about \$6 per picul. Demand throughout was fair and of a quantity of 527 tons cataloged for sale 253 tons found buyers.

Standard sheet and crepe each sold up to \$115 and at this figure mark declines of \$7 and \$6 respectively. Plain smoked sheet met with a poor inquiry and only a few parcels were sold. Brown and lower grade crepes were in fairly good demand, but prices were about \$5 lower on the week. Scraps were neglected.

The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed, smoked	\$113 @ 115	2/ 3¼ @ 2/ 3½	55.24 @ 56.00
Sheet, good ribbed smoked	110 @ 112	2/ 2½ @ 2/ 3	53.97 @ 54.73
Sheet, plain smoked	101 @ 108	2/ 0¾ @ 2/ 2½	50.17 @ 52.95
Sheet, ribbed unsmoked	97 @ 98	1/ 11½ @ 2/ 0	48.39 @ 48.90
Sheet, plain unsmoked	100 @ 103	2/ 0½ @ 2/ 1¼	49.66 @ 50.93
Crepe, fine pale	113 @ 115	2/ 3¼ @ 2/ 3½	55.24 @ 56.00
Crepe, good pale	105 @ 111	2/ 1½ @ 2/ 2½	51.70 @ 54.22
Crepe, fine brown	102 @ 106	2/ 0¾ @ 2/ 1¼	50.42 @ 52.20
Crepe, good brown	88 @ 101	1/ 10 @ 2/ 0¼	44.60 @ 50.17
Crepe, dark	71 @ 94	1/ 6¾ @ 1/ 11½	37.24 @ 47.13
Crepe, bark	60 @ 87	1/ 4½ @ 1/ 9¼	32.68 @ 44.09
Scrap, virgin	70 @ 86	1/ 6¼ @ 1/ 9	36.99 @ 43.58
Scrap, pressed	50 @ 71	1/ 2 @ 1/ 7	28.38 @ 39.53
Scrap, loose	50 @ 70	1/ 2 @ 1/ 7	28.38 @ 39.53

*Picul = 133½ pounds.

†Figured at standard rate of exchange, 1s. = 24 cents.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of August as 5,782 tons against 5,053 tons in July last and 3,796 tons in the corresponding month last year. This gives a total of 37,926 tons for eight months of the current year against 26,673 tons in 1915 and 18,673 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.

THE MARKET FOR RUBBER SCRAP.

Copyright 1916.

NEW YORK.

SEPTEMBER has shown a marked improvement in the rubber scrap market as compared with the preceding month. Early in the month there was considerable activity noticed on the part of dealers who had been covering on old contracts. The actual volume of business, however, has not been large, but following the improved position of crude rubber and the fact that the large buyers are yet to be heard from, it would seem that better conditions are due in the near future.

BOOTS AND SHOES. Purchasers of this material confined their orders to supplies sufficient only for immediate needs. Although some irregularity was noted early in the month, prices appeared to be well established at 9 cents delivered, as holders were confident in the firmness displayed by this particular grade.

AUTO TIRES. There was considerable improvement in this material and toward the latter part of the month the market was quite firm. Mixed tires were quoted 6@6½ cents for mill deliveries, while white G. and G. tires were considered high at 8½ cents. Some small lots of inner tubes have been moved at somewhat lower prices than a month ago. Solid tires have improved somewhat and sales were reported at unchanged prices that later in the month developed firmness. The other grades have remained practically featureless.

MECHANICALS. Dullness has characterized this material during the entire month, black scrap and garden hose being particularly stagnant.

For the twelve months ended June 30, 1916, United States imports of rubber scrap were 16,371,573 pounds, value \$1,271,903, compared with 11,006,928 pounds, value \$726,914, for 1915; 25,958,261 pounds, value \$2,063,198, for 1914. Exports of rubber scrap for the same period were 4,561,177 pounds, value \$424,650, for 1916; 2,422,091 pounds, value \$291,421, for 1915; 6,207,678 pounds, value \$598,287, for 1914.

London imports of waste and reclaimed rubber during August were 132,700 pounds; for Liverpool, 115,600 pounds. London exported during the same period 586,400 pounds; Liverpool, 479,600 pounds.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1916.

NEW YORK.

ANOTHER extraordinary jump in raw cotton followed the sensational advance of a month ago and January contracts were forced up to 16.42. The gloomy crop report and active buying in the South are the reasons attributed to this movement. During the month the market weakened under heavy selling pressure, but a renewal of general bull support carried January deliveries up to 16.30 on September 20, or within 18 points of the high record of September 1. The rumors of heavy buying for British account have not been confirmed. The opinion is current that 20-cent cotton will be a fact before many months.

R. Lamour Neill, a statistician of reputation, estimates this year's crop at 13,000,000 bales, exclusive of linters, or about 14,000,000 bales including linters.

SEA ISLAND COTTON. An active demand marked the opening of the southern markets that have been closed since August 1. Prices were irregular and the tone of the market sensitive. Fancy Georgias and Floridas were selling at 31@32 cents in Savannah September 8. Prices advanced strongly during the month and on September 22, Fancy Georgias and Floridas were selling in an excited market at 34@35 cents. The advance in Egyptians and the small amount offered will doubtless result in heavy demands and higher prices for Sea Islands. Crop reports from the Islands are not promising, while the Georgia and Florida crop on the whole is favorable.

EGYPTIAN COTTON. The continued rise in the American markets and unfavorable crop reports have been followed by a firm market and advancing prices, F. G. F. Sakelarides being quoted at 34 on August 25. The present is the most critical period for the Egyptian crop which, generally speaking, is not as favorable as two weeks ago. However, a definite forecast would be premature at this time.

HOSE AND BELTING DUCK. Foreign business has been easier this month and the domestic demand for mechanical duck has been about normal. The extraordinary call for all other rubber fabrics will doubtless result in a scarcity of hose and belting duck. Moreover, a government order for 2,000,000 yards of army, sail and wide duck will be placed early this month. This will require considerable loom capacity and result in a shortage elsewhere. The rubber trade is well covered for the first six months of 1917 and hose and belting contracts are being written for deliveries during the last half of next year.

SHEETINGS, DRILLS AND ENAMELING DUCK. The market is strong and price advances have been recorded in the entire list during the month. Wide grades are prominent in the demand, which is absorbing the capacity of the mills. Rubberized sheeting with imitation leather finish for auto tops is being substituted for cotton mohair.

TIRE FABRICS. The demand is very great and the mills are sold up to capacity. The advancing prices of raw material and inability of the manufacturers to secure the necessary labor and new loom equipment have advanced prices and prolonged contract deliveries of tire fabrics to July, 1917. While it is generally conceded that the large consumers are covered, there are indications of a shortage in tire building fabrics.

THE MARKET FOR CHEMICALS AND OTHER INGREDIENTS.

Copyright 1916.

NEW YORK.

THE rubber chemical market for the past month has developed no unusual features worthy of special record. Generally speaking, the situation has been dull and prices have declined, with but few exceptions in the list. This was expected as a natural result of the high prices prevailing during the past year and their return to normal levels. Toward the end of September, trade was better in certain quarters, both foreign and domestic; inquiries had increased and, in consequence, prices were a shade firmer. These are signs of returning business activity that is confidently expected to be fully realized by November.

BARYTES. The trade continues to take goodly amounts of barytes, and the demand keeps pace with the production, which is constantly increasing. Prices are firm and somewhat lower than a month ago.

LITHARGE. Contract deliveries of litharge have been freely made to the mills during the month. Producers report being well sold ahead for some time. There is a good demand and considerable inquiry for export. Prices are firm and unchanged.

LITHOPONE. Both foreign and domestic lithopone have gradually declined during the month. There was considerable movement of this material against old contracts placed some time ago at different prices. Spot stocks are not plenti-

ful and some sellers are having difficulty in making deliveries.

ZINC OXIDE. The decline in spelter resulted in lower prices, effective October 1, on French process grades, covering deliveries over the last quarter of the year. There was no change in American process grades.

DRY COLORS. Prices in general have gradually declined. Ultramarine blues and reds, however, have not changed much and are still scarce, while the imported grades are unobtainable. Red oxide is scarce and prices firm.

NAPHTHA. All the grades, used in the trade have declined a cent since last month.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

FIRE AND ACCIDENT PREVENTION DAY.

To eliminate common fire and accident hazards from the United States and Canada the National Fire Protection Association and the National Safety Council are urging the nationwide observance of Fire and Accident Prevention Day on October 9, the anniversary of the great Chicago fire. An attractive poster has been designed, and suggested programs for observance of the day worked out, which are being distributed to the civic and commercial organizations of the country. The national and Dominion associations of fire chiefs, fire marshals and credit men are coöperating. While sporadic observances of fire prevention day have heretofore been held in certain states and cities, this is the first organized attempt to promote its general observance throughout this nation and the Dominion.

TABLE OF CONTENTS ON LAST PAGE OF READING.**"VULCANIZATION WITHOUT SULPHUR."**

FROM its inception the world's rubber industry has depended upon sulphur to effect vulcanization. Nor has there been a substitute discovered or invented. Possibly none is now in sight, but the exceedingly interesting experiments conducted by the eminent Russian chemist, Professor I. I. Ostromyslenski, lead one to think otherwise.

The details of the learned professor's experiments and conclusions, although published in the "Journal of the Russian Physico-Chemical Society," were not available to the English-speaking world. Appreciating this, and alive to the widespread interest on the part of the chemist and rubber manufacturer in such a subject, the "India Rubber Journal" secured an eminent linguist to translate the three papers. This translation they published in full in their issue of September 30. THE INDIA RUBBER WORLD republishes the papers in this issue, and on its own behalf and that of its readers takes this occasion to thank

our British contemporary for rendering available this most original and valuable contribution to the literature of india rubber.

CHEAPER SOLVENT NAPHTHA THROUGH ALCOHOL.

WE HAVE but lately called attention to the importance of solvent naphtha in the rubber industry, the enormous quantities consumed, and the significance of the prevailing high cost. Since then, the price of gasoline has been reduced three cents a gallon, but the present 25-cent rate is still virtually double the price of a year ago, so that the matter today is no less vital to proofers and cement makers.

Governmental investigation and new cracking processes may obviate any new price increases for a time, but it is doubtful if they can bring about any very great further reductions. Of course, continued high prices would eventually encourage the production of gasoline from natural gas and also from shales, but such departures take time.

The wider use of industrial alcohol, which has become a certainty of the immediate future, presents the most promising solution of this vital problem. Dr. Arthur D. Little, the eminent chemist, is authority for the statement that there is no longer any question of the manufacture of alcohol on a commercial scale as a fuel for automobiles. Experiments have shown, he claims, that alcohol can be made for 25 cents a gallon, at which price it would be preferable to gasoline. It is cleaner; will not catch fire nor explode; will develop almost as much horse-power as gasoline, and the combustion products are negligible.

According to the Du Pont Laboratory, the production of alcohol from sawdust treated with sulphuric acid in a lined converter and subjected to heat and pressure, has already proved a commercial success. Another process to utilize the fermentable sugars existing in waste sulphite liquors at pulp mills has great future promise. It has been estimated that the proportion of alcohol present is about 1½ per cent, and that enough sulphite liquor now goes to waste to yield an output of 200,000 gallons of alcohol a day. Pure alcohol can be obtained in this way, but other compounds are usually present. Although the process has not in every instance proved successful, due to the high cost of the labor involved, this condition can probably be overcome. Still another important source of alcohol for commercial purposes is suggested by the fact

that about one-seventh of the world's total sugar production annually goes to waste.

The progress and future outlook of industrial alcohol means much to rubber manufacturers in almost every line, for its use in motors will insure cheaper solvent naphtha; indeed, in this respect, will outclass any opening of new petroleum fields or discovery of new cracking processes. It is also predicted that cheap alcohol may make possible the production of synthetic rubber at less than 25 cents a pound—the approximate cost of plantation rubber—a circumstance which, in turn, suggests employing petroleum bases for the same purpose should the market for one of the most profitable petroleum products, gasoline, be lost to alcohol.

THE PERIL OF PEACE.

DEPENDENT as American rubber manufacturers are upon Europe for crude rubber, they face the ever-present possibility of a sudden interruption of the supply. This might take the form of an embargo, because of international or trade differences, or of a virtual blockade of the ports receiving rubber. So far, the trade has been remarkably fortunate. While the war continues it is probable that the same favorable conditions will prevail; but what are the rubber prospects once peace is declared? That economic conditions will be vastly changed cannot be doubted for an instant. The enormous costs of the greatest and most terrible of all wars are certain not only to entail economies, but to create tariffs that will be great in proportion to the needs of the various belligerent countries.

It looks more and more as if free-trade England is turning definitely toward high tariff. Certainly, once her need of foreign-made goods becomes less imperative she is bound to protect home manufacturers, not alone in England proper, but in the great British colonies as well.

Nor is it supposable that with the crude rubber business in her own hands she will long omit to impose an export tax sufficient to be of material assistance in liquidating her immense war debt. Holland, too, has suffered great financial losses through the war, and an export tax on india rubber assessed by English colonies would doubtless be imitated by the colonies of the Netherlands.

Of course, this would stimulate rubber planting and do much for wild rubber besides; but prices would go up and stay up on all grades. It is probable that nothing will be done by America to counteract this tendency. Certainly, our government will not, perhaps cannot, come to the

rescue of the trade as England or Germany would under like conditions. It will be recalled, for instance, that America once held the rest of the world in leash with her practical monopoly of cotton growing. To offset it England produced not only Egyptian, but Indian and West Indian cotton. And in this she was wise and right.

American investments in rubber plantations of the Far East, already large, will doubtless have a mitigating influence. What would be far more potent, however, would be American plantations in American territory; not to drive the Far Eastern planter from the field, for he deserves his success and should be protected, but just to keep us from being so wholly, so helplessly dependent.

PENALTY DUTY ON INDIA RUBBER?

THE rubber trade received a disagreeable jolt a day or two ago when the New York "Herald" bureau at Washington outlined the provisions of a recently enacted tariff law. It was a bit of "eleventh hour" work and intended to protect the American dye manufacturers from German competition. As such it contained a provision for "penalty duties on articles imported into the United States under the agreements affecting the purchase of other goods by the importer." According to the "Herald" it is found that the provision "requires the imposition of penalty duties on all dutiable raw materials controlled by the Allies and sold to Americans under restrictions preventing export, etc."

India rubber is purchased under such restrictions and would seem to be subject to penalty duty. At the same time, however, comes the comforting assurance that it was all "a mistake" and that "No concealment was made of the intention to find some way of avoiding the enforcement of the law if that be possible."

OCOTILLO (ALSO KNOWN AS OCOTOLLO AND OCOTELLO) RUBBER, which has set Arizona ablaze, may or may not prove of use in general rubber manufacture. It may go the way of rabbit weed rubber and the seaweed rubber, but even in failure, if failure come, it will point a moral. And that is the wonderful market for American grown rubber or rubber-like gums, a market that will be supplied some way, some day.

ONE OF THE BRIGHT PUBLICITY MEN OF THE GOODYEAR TIRE & RUBBER Co. has spread broadcast, through the daily press, a tale to the effect that the Mexican peons use cast-off Goodyear tires for shoes. It may be true, nor is it for us to doubt it, but is this not a direct infringement? Has not the Goodrich company copyrighted "Barefoot" tires? Or do the peons also wear inner tubes for stockings?

Mechanism of the Process of Vulcanization of Caoutchoucs.

By I. I. Ostromyslenski.

[From the "Journal of the Russian Physico-Chemical Society," 1915, pages 1,453-1,461. Translated from the original Russian by Thomas H. Pope, B.Sc. Translation revised by Dr. H. P. Stevens, published in the "India Rubber Journal," September 30, 1916.]

THE hot vulcanization of caoutchouc discovered by Goodyear (1839) proceeds, as is well known, under simple conditions; a homogeneous mixture of the caoutchouc and sulphur is heated at 130 to 145 degrees. That is all. As a result, the initial caoutchouc loses its plasticity, and separate pieces of fresh fractures no longer exhibit the power of adhesion. The solubility is lowered, and the "interval of elasticity" increased; the fatal temperature of well vulcanized natural caoutchouc lies at about — 35 degrees, that of the chemically pure product being about — 18 degrees. What takes place during the heating of the caoutchouc? Attempts to explain this peculiar process have exhausted all the theoretical possibilities. Some investigators regard it as an exclusively physical process, and others as solely a chemical reaction, whilst many authors consider vulcanization to be determined by both physical and chemical changes.

Since all phenomena, at any rate, of unorganized nature, are divided into only two groups—the physical and the chemical—there can be no essentially new theory of vulcanization. Nevertheless, the nature of the mechanism of the process even yet remains unexplained.

The supporters of Weber's chemical theory regard vulcanized solid caoutchouc (chonite) as a polymeride of the compound, $C_{10}H_{16}S_2$ (16 per cent of sulphur), whilst others, for instance, Erdmann, consider it to be the thiozoide, $C_{10}H_{16}S_3$, or even a dithiozonide. On the other hand, many identify the vulcanization of caoutchouc with the process of "swelling" (Quellung) of colloids or that of gelatinization or adsorption, that is, with the processes of formation of solid or "semi-solid" solutions, etc.

Some of the supporters of the "mixed" theory consider that the sulphur itself swells or is adsorbed or dissolved in the free caoutchouc, whereas other authors assume the preliminary formation of a compound of the caoutchouc with the sulphur—although only in insignificant amount—this compound being then adsorbed in the still unchanged caoutchouc.

I shall not devote time to the extensive literature of this question, but shall proceed immediately to the conclusions which result from my observations and my new methods for vulcanizing caoutchouc.

Until now no method of vulcanizing caoutchouc has been known in which any organic or mineral compound not containing sulphur is used as vulcanizing agent.* But the chemical and especially the physical theories of vulcanization anticipate the possible existence of a whole series of such compounds. I decided to attempt to find substances which may replace sulphur in the vulcanization of caoutchouc.

It was thought that the investigation of the action of homologues and analogues of such substances on caoutchouc and that of the external conditions of the new process—the influence of different admixtures, accelerators, etc.—might elucidate the mechanism of vulcanization itself.

This task has now been completed, and two new methods for the hot vulcanization of caoutchouc have been discovered.

When heated with unsaturated hydrocarbons, sulphur produces a twofold effect: it combines at the double bond with formation of thiozonides (Erdmann), or it oxidizes the ethylene grouping, removing hydrogen in the form of hydrogen sulphide, a new

ethylenic derivative, or a new compound containing sulphur being thus formed.*

On the physical side, sulphur is characterized, besides by the ordinary constants (specific gravity, melting point, etc.), and by its ability to exist in different polymorphic modifications (rhom-bic, hexagonal, amorphous, etc.).

In searching for organic substances which vulcanize caoutchouc like sulphur, the first to be investigated are those which resemble sulphur in oxidizing ethylenes, and at the same time are able to unite at the double linking. Of the physical constants of such substances the essential ones are the melting point and the vapor pressure at the temperature of vulcanization; after these, the solubility in caoutchouc, specific gravity, etc. Besides possessing physical constants near to those of sulphur, the sought for compounds should exist in polymorphic modifications.

This explains why, in this investigation, I first of all made a halt at compounds containing the nitro-group. These oxidize organic substances (e. g., in Skarup's synthesis of quinoline), and at the same time readily combine with various ethylenes (attention may be called to the compounds of Ar (NO_2) with polycyclic hydrocarbons and to the author's use of tetranitromethane as a reagent for double bonds).

1:3:5-Trinitrobenzene has a melting point, 118 degrees, very near to that of sulphur, i.e., below the temperature of vulcanization, and in specific gravity it also resembles sulphur. Further, most polynitro-compounds exist in polymorphic modifications.

1:3:5-Trinitrobenzene was the first instance which I hoped would serve as a substitute for sulphur in vulcanization. Experiment completely confirmed my expectation. It was found that both synthetic and natural caoutchoucs are vulcanized more rapidly and easily by various nitro-compounds than by sulphur itself under the same conditions. The result was a product possessing all the associated physical properties of caoutchouc vulcanized by means of sulphur. Experiments were made with both fatty and aromatic nitro-compounds, and vulcanization took place with nitrobenzene, dinitrobenzenes, trinitrobenzenes, tri- and tetra-nitronaphthalenes, picric acid, picramic acid, picryl chloride, "artificial musk," nitro-cyclohexane, and many other compounds.

Further investigation showed that the vulcanizing properties of nitro-compounds do not depend on their capacity for combining at the double linking. As is well known, picric acid combines with ethylenic compounds considerably more readily than most other nitro-compounds of the aromatic series, and yields more stable products. Next in order come picryl chloride, picramic acid, trinitrobenzene, etc.; dinitro- and mononitro-benzenes do not unite at all with ethylenic derivatives.

On the other hand, according to their vulcanizing power, nitro-compounds are arranged in the reverse order, or, more accurately, in an order which reveals no analogy between the processes of vulcanization and of combination at the double linking.

Caoutchouc is vulcanized most rapidly and easily by 1:3:5-trinitrobenzene, after which come dinitrobenzene, mononitrobenzene, tetranitronaphthalene. Picric acid and picryl chloride do not yield satisfactory products; vulcanization undoubtedly begins, but, in spite of many series of experiments, I have never succeeded in bringing it to completion; the caoutchouc partially retains its plasticity, and sticks when fresh fractures are pressed together.

*The process of vulcanization is often termed the sulphuring of caoutchouc. Vulcanization by calcium or sodium hypochlorite or free hypochlorous acid, like vulcanization by halogens (bromine, iodine, or iodine bromide), leads, as is known, only to "horny" rubber, i.e., to ebonite-like substances. Compare Marckwald and Frank, "Über Herkommen und Chemie des Kautschuks," Dresden, page 62.

*When acenaphthere is heated with sulphur, the hydrocarbon $C_{14}H_{12}$ (deca-cyclene) is formed.

Mononitrolet etc., however, gives completely satisfactory results.*

The combining capacity of nitro-compounds increases with the number of nitro-groups in the molecule, but we are convinced that the vulcanizing power of nitro-compounds does not depend on this cause. Ostromyslenski found that tetranitromethane unites with ethylenic compounds of both the aromatic and aliphatic series, but in no case has it been possible to vulcanize caoutchouc with tetranitromethane, although a large number of attempts have been made.

Various other substances which, like nitro-compounds, are able to unite with ethylenic derivatives, have also been tried, among them triphenylmethane and diaminotriphenylmethane. These compounds, in perfect agreement with the above results, cause no trace of vulcanization, the caoutchouc remaining sticky and plastic, and retaining even its pale color.† These facts show that the power of nitro-compounds to vulcanize caoutchouc is not determined by their ability to combine with ethylenes.

Is any rôle in the vulcanization played by the capacity of nitro-compounds to oxidize organic substances—by their property of yielding active oxygen with formation of nitroso-compounds? In other words, does the vulcanizing action of nitro-compounds depend on the combination of active oxygen at the double linking of the caoutchouc? This question must, as experiment shows, be undoubtedly answered in the affirmative. First of all, nitroso- and isonitroso-compounds do not vulcanize, as is shown by experiments with nitrosobenzene and isonitrosocamphor under various conditions. This result leads to the assumption that the vulcanizing power of nitro-compounds belongs to one of the oxygen atoms of the NO_2 radicle. It follows, therefore, that under suitable conditions caoutchouc should be vulcanized by ozone or ozonides, or by various peroxides, per-acids, etc.

This fundamental conclusion has been confirmed by direct experiment, a second new method having been found for the hot vulcanization of caoutchouc by compounds containing active oxygen. Special attention has been paid to the vulcanization of natural and synthetic caoutchoucs with benzoyl peroxide and perbenzoic acid. It is found that caoutchouc is vulcanized by benzoyl peroxide incomparably more rapidly and easily than by sulphur or even nitro-compounds.

In order to confirm the deciding part played by the oxygen atom, attempts were made to vulcanize caoutchouc with barium peroxide. This substance yields its oxygen with moderate rapidity only at very high temperatures, and should not effect vulcanization‡ if the latter is determined by the combination of oxygen at the double linking of the caoutchouc. Actual experiment gives the results expected, since barium peroxide produces no trace of vulcanization.

These new methods of vulcanizing caoutchouc, and the favorable results obtained, are of undoubted scientific and practical interest, and in the first place throw new light on the puzzling mechanism of this process.

We are convinced that the present day vulcanization of caoutchouc begins with a chemical process. Only certain classes of substances—sulphur and some of its derivatives (S_2 , Cl_2 , Ca S_2 , etc.), nitro-compounds, peroxides and per-acids—bring about vulcanization. The physical constants and peculiarities of the vulcanizing substance are without influence on the final effect. What can there be common to the physical properties of gaseous oxygen, sulphur, tetranitronaphthalene and perbenzoic acid? At the same time it is sufficient to replace the oxygen of dinitrotriphenyl-

methane by hydrogen or to remove from the nitro-group of nitrobenzene one atom of oxygen, to obtain a compound—diaminotriphenylmethane, nitrosobenzene—absolutely devoid of the power to vulcanize caoutchouc.

In the process of vulcanization, chemical reactions are allotted, therefore, a definite but still quite modest place. Chemical action with the vulcanizing compound occurs with only a negligible fraction of the initial caoutchouc. Thus, it is found that the complete vulcanization of 100 parts of natural Para caoutchouc requires only 0.5 parts of nitrobenzene or 1:3:5-trinitrobenzene.

There can be no question here of molecular proportions, since 100 parts of $\text{C}_{10}\text{H}_{10}$ would correspond with a minimum of 156 parts of $\text{C}_6\text{H}_5(\text{NO}_2)_3$. Even if it is assumed that $\text{C}_{10}\text{H}_{10}$ requires only one atom of active oxygen—which is not true—and that the molecule of trinitrobenzene contains three atoms and that of nitrobenzene one atom of active oxygen, 100 parts of caoutchouc would require 52 parts of trinitrobenzene or 90 of nitrobenzene. Even the corresponding solid ebonite is, however, obtained by vulcanizing rubber in presence of 10-15 per cent. of trinitrobenzene.

Thus, with the actual methods for vulcanizing caoutchouc only a vanishing part of the latter enters into chemical reaction, but this reaction is actually indispensable. The further course of this interesting process is conditioned by physical interaction between the vanishing quantity of caoutchouc which has reacted and that which has remained unchanged.

Thus, we arrive at the conclusion that the vulcanization of caoutchouc is divided sharply into two fundamental phases: (1) A chemical reaction affecting only an insignificant part of the caoutchouc, and (2) adsorption or swelling of the unchanged caoutchouc into the product of this chemical reaction.

Vulcanization may, however, be imagined as an exclusively physical process, since theoretically it may begin with the second phase of the process. Thus, instead of bringing nitro-compound, sulphur, or peroxide into contact with caoutchouc, we may isolate and make use of the minute proportion of substance formed in our first phase; by heating this mixture we should undoubtedly obtain vulcanized caoutchouc. In such case vulcanization takes place in a single phase—adsorption or swelling of the initial caoutchouc into the mixed product, and represents an exclusively physical process typical of caoutchouc. In vulcanization by means of sulphur the existence of the latter in the free state is of no importance, as it is necessary only for the preliminary formation of its compound with caoutchouc, and then only in negligible amount.*

The elastic and other properties of caoutchouc vulcanized, for instance, by trinitrobenzene, are qualitatively and quantitatively identical with those of caoutchouc vulcanized with sulphur. Both substances are devoid of plasticity and stickiness and exhibit similar difficult solubility, etc.

Only by chemical analysis might these two vulcanizates be distinguished, although they are obtained by treatment of caoutchouc by absolutely different compounds. The nature of the vulcanizing substance, is, therefore, almost without influence on the physical properties, solubility and all the elastic properties of the resulting caoutchouc; it has, further, no effect on the chemical properties of the vulcanizate, since the latter contains only a negligible proportion of foreign substance.

It may again be emphasized that the characteristic changes in the properties of caoutchouc produced by vulcanization are determined exclusively by a physical process—the adsorption or “swelling” of the caoutchouc.

These new methods of vulcanization of caoutchouc open up a wide perspective, and it may be that the nitro-compounds, peroxides, and per-acids represent only the “first swallow” and that

* Slight cohesion between freshly cut surfaces, as is well known, does not indicate that vulcanization is incomplete, especially with rubber which has been only recently vulcanized.—H. P. S.

† This again is not necessarily an indication that vulcanization has not taken place.—H. P. S.

‡ It has been already found that the melting point of the vulcanizing substance does not affect the process. Thus, caoutchouc is readily vulcanized by nitrobenzene, which is a liquid, and by tetranitronaphthalene, which melts at 218 degrees, whereas the vulcanization proceeds at 116-145 degrees.

—“It may be that this compound vulcanizes caoutchouc only when in “*statu nascendi*.”

further work will reveal sooner or later other quite diverse substances capable of vulcanizing caoutchouc like sulphur.†

[SECOND PAPER.]

[From the "Journal of the Russian Physico-Chemical Society," 1915, pages 1,462-1,467. Abstract from "Journal of Society of Chemical Industry," Vol. XXXV, p. 59.]

Further investigation of this method of vulcanization shows that natural Para caoutchouc is completely vulcanized by as little as 0.5 per cent of trinitrobenzene, whereas 6 per cent of sulphur would be required. Further, in the latter case, the unavoidable presence of free, uncombined sulphur lowers the technical value of many rubber wares. The use of different organic compounds for vulcanization of caoutchouc allows of considerable variation in the physical properties, *e. g.*, flexibility, elasticity, etc., besides in the color, smell, etc. Vulcanization may be effected by mono-, di-, and trinitrobenzenes, -toluenes, etc., tri- and tetra-nitronaphthylamines, picramic acid, picryl chloride, artificial musk, nitro-cyclohexane, nitro-dyestuffs, etc. Metallic oxides, which facilitate the vulcanization of rubber by sulphur and enhance the value of the product obtained, exert a similar effect on vulcanization by nitro-derivatives; lead oxide is most valuable in this respect, and then follow, in order, oxides of zinc, calcium, magnesium, barium. On the other hand, mixtures of aliphatic amines with the above oxides, although they accelerate vulcanization by sulphur or

†It might be expected on theoretical grounds that caoutchouc would be vulcanized under suitable conditions by oxides of nitrogen, hydrogen peroxide, ozone, ozonides of the terpenes, oxygen or air in presence of compounds which activate oxygen, and many other substances.

lower the temperature of the process to 10 to 15 degrees C., retard vulcanization by nitro-compounds and lower the value of the corresponding product. Like sulphur and sulphur chloride, nitro-derivatives vulcanize, not only caoutchouc, but also various vegetable oils yielding products analogous to factice.

[THIRD PAPER.]

[From the "Journal of the Russian Physico-Chemical Society," 1915, pages 1,467-1,471. Translated from the original Russian by T. H. Pope, B.Sc.]

The vulcanization of caoutchouc by means of peroxides proceeds considerably more rapidly and at a lower temperature than vulcanization by means of sulphur or even nitro-compounds. The theoretical significance of this process has been already considered in earlier papers.

Vulcanization by the action of benzoyl peroxide has been investigated in detail. It is found: (1) That metallic oxides which accelerate the vulcanization of caoutchouc by means of sulphur or nitro-compounds—PbO, ZnO, MgO, CaO, etc.—are almost without effect on vulcanization by benzoyl peroxide; in some cases they diminish the velocity of the process, and in most instances increase the oxidizability, that is, the rate of decomposition, of the given vulcanizate. (2) Colophony and other resins lower the stability of caoutchouc on vulcanization by benzoyl peroxide. (3) Mixtures of amines and metallic oxides, which were found by the author to act as accelerants of the ordinary vulcanization of caoutchoucs by sulphur, retard vulcanization by the new method and decrease the stability of the corresponding vulcanizate. (4) Proteins exert a similar in-

24	Normal isoprene	8	1: 3: 5-C ₆ H ₃ (No. ₂) ₃	0.8	2.4	3 atms.	5	Vulcanization complete; in 15 mins. (3 atms.) strongly over-vulcanized product obtained.
25	Abnormal diemethylerythrene	100	1: 3: 5-C ₆ H ₃ (No. ₂) ₃	7.5	3	3 atms.	5	Vulcanization complete; elastic point of the vulcanizate lies at about 80-90°.

fluence on the vulcanization of caoutchoucs by means of sulphur, nitro-compounds or peroxides; they increase the extensibility and the constant K' , i.e., the tensile strength of the vulcanizate.

On normal vulcanization by means of benzoyl peroxide the physical structure of caoutchouc is not destroyed. It is, however, necessary to avoid excess of the peroxide and, for every given benzoyl peroxide mixture, to establish exactly the necessary temperature and time for the vulcanization. If not, the vulcanizate will exhibit, like "abnormal" and also like chemically pure caoutchoucs, negligible extensibility and tensile strength*; the protein compounds may be oxidized by the benzoyl peroxide, and their destruction may be accompanied by that of the physical structure of the given caoutchouc.

Caoutchoucs normally vulcanized by benzoyl peroxide exhibit both qualitatively and quantitatively all the typical properties of caoutchoucs vulcanized by either sulphur or nitro-compounds; when kept, they do not change.† Caoutchoucs vulcanized with a slight excess of benzoyl peroxide soon (1-5 days) develop on their surface soft, colorless, crystalline leaflets, which are as transparent as glass, and possess pronounced lustre; after the lapse of a longer time (1, 3 or 5 months) the vulcanizate begins to oxidize and gradually becomes sticky; finally it runs, becoming converted into a sticky, more or less viscous, plastic mass‡. The vulcanizate decomposes especially rapidly when in contact with the original, non-vulcanized mixture, which evidently acts as a "detonator."

Consequently, when different mixtures of caoutchouc and benzoyl peroxide are either heated or stored, two processes take place simultaneously: (1) Vulcanization of the original caoutchouc, this being connected with partial or complete union of the oxygen of the peroxide with the caoutchouc, and (2) oxidation of the caoutchouc by the benzoyl peroxide with formation of the highly sticky mass mentioned above.

The relative rates of these two processes determine the effect of the vulcanization, and experiment shows that these rates depend on the proportion of benzoyl peroxide, on the temperature, on the prolongation of the vulcanization, and on the nature and quantities of the foreign matters in the initial mixture.

Vulcanization of caoutchouc with benzoyl peroxide requires, therefore, increased attention or skill in the operator.

When once started at a high temperature, the process of vul-

canization continues comparatively rapidly, even at the ordinary temperature. Thus, it was found that a mixture of normal erythrene caoutchouc and a small excess of benzoyl peroxide converted after 27 days into a very sticky, viscous mass, which later gradually runs or assumes the form of the containing vessel. When previously heated, without access of air, for two minutes at 85 degrees, the same mixture does not run when kept (at the ordinary temperature); on the other hand, the stickiness already present disappears spontaneously; the plasticity of fresh sections and their proneness to become sticky are lost, and the mixture gradually vulcanizes at the ordinary temperature, and finally even over-vulcanizes owing to the excess of benzoyl peroxide present.

It is seen that the relative velocity of oxidation, on the one hand, and of vulcanization on the other, depends on the character of the preliminary treatment, in the given case on the two-minutes' heating at 85 degrees.

This fact explains immediately why incomplete vulcanization protects caoutchouc from oxidation or decomposition in the air.

The benzoyl peroxide may be replaced by perbenzoic acid, and probably by ozone, ozonides of caoutchouc or terpenes, oxides of nitrogen, certain metallic peroxides, hydrogen peroxide, etc.

Further, my observations show that barium peroxide produces no trace of vulcanization in caoutchouc. Into natural Para caoutchouc were introduced 1 per cent, 5 per cent, 10 per cent, 15 per cent and 50 per cent BaO_2 , the mixtures being vulcanized for 5 minutes, 10 minutes, 30 minutes, and 2 hours with steam at 2, 3 and 4 atmospheres' pressure in a press; under these conditions the mixture underwent no change, its plasticity and even its light color remaining quite unaltered. This interesting observation lends further confirmation to the fact that vulcanization of caoutchouc by the above method takes place at the expense, not of the peroxides themselves, but of their active oxygen.

The accompanying table contains recipes for the vulcanization of different caoutchoucs with benzoyl peroxide. It must be pointed out, however, that the external conditions indicated in this table are by no means ideal.*

To conclude, in presence of 0.5-3 per cent of benzoyl peroxide, normal synthetic caoutchouc obtained on coagulation of its solution, undergoes at about 80 to 120 degrees C. incomplete vulcanization; the external appearance, and all the new properties of the product obtained compel the assumption that some forms of natural rubber represent products of incomplete (incipient) vulcanization caused by active oxygen.†

*The detailed recipes for the vulcanization of caoutchouc by means of benzoyl peroxide, together with other documents kept in my pocket-book, were unfortunately stolen from me.

†Or by compounds containing active oxygen, etc.

*Products of acid color are formed, evidently identical with those appearing when this caoutchouc is kept in the air.

†When kept, this product does not change in six months.

Proceedings of the "Rubber Section"—Continued.

Two important addresses delivered before the Rubber Section of the American Chemical Society during the September, 1916, Convention were printed here last month. Below are given three other interesting papers. A full report of the symposium, in which some 20 rubber chemists participated, will be given in the December issue.

WET COMBUSTION IN THE NITROSITE-COMBUSTION METHOD FOR THE DIRECT DETERMINATION OF RUBBER.*

By L. G. Wesson and E. S. Knorr.

IN order to make more feasible the possible use in technical laboratories of the nitrosite combustion for the direct determination of rubber in rubber goods, we have attempted the application of "combustion in the wet way" to this analytical procedure.

The "nitrosite-combustion" method as described in a previous publication, is based upon the formation of the "nitrosite" of rubber by the action of nitrogen oxide gases upon the caoutchouc of the sample. This is then separated from other substances (fillers), and burned in a specially constructed electrically-heated combustion tube. The special apparatus and technique required was a decided obstacle to the general use of this method, even should its reliability be demonstrated, and we therefore turned to "wet combustion" as an escape from this difficulty.

In the course of our experiments, acetone - extracted crude rubber was first used. The nitrosite was formed in the flask used for the combustion, and after the complete expulsion of the rubber solvent (chloroform), the combustion followed in a manner quite similar to those later described. We obtained as dependable values, 96.8, 97.0, 97.6 and 97.1 per cent $C_{10}H_{16}$. Average is 97.1 per cent; theoretical, 97.3 per cent $C_{10}H_{16}$.

In the regular analytical procedure this simple treatment of the nitrosite is not possible, since the latter must be separated from the mineral matter and other impurities by the use of some solvent, after filtration from the chloroform. We first used as solvent, acetone, which was added to the dry nitrosite in the combustion flask. The acetone was first evaporated off, then the flask was heated 1 1/2 hours by a boiling water bath whilst a current of dry air passed slowly through the flask. The value now obtained, (100.7 per cent) upon combustion, indicated a retention of acetone.

A repetition of this experiment with the use of only ethyl acetate as solvent gave 96.4, 97.1 and 97.0 per cent $C_{10}H_{16}$. These figures were more promising. Moreover, the ethyl acetate on evaporation left the residual nitrosite in a more porous, and thus

more favorable condition for rapid expulsion of the organic solvent than did the acetone. Ethyl acetate was therefore adopted as the solvent in all of the analyses of vulcanized rubber.

The use of acetic ester did not, however, eliminate our troubles with retained solvent, as we found when we next turned to the analysis of compounded rubber samples, instead of the raw gum. We believe that this difficulty explains most of the erratic results we had to the end of our work. We believe that we have now found the remedy for this retention of solvent in the addition of water, containing a drop of hydrochloric acid, to the nitrosite, and subsequent evaporation of this to dryness, after all solvent has been removed in the ordinary way.

In a sample compounded with 35.0 per cent Fine Para, using the method described, we found 34.7, 34.9, 34.8 and 34.2 per cent $C_{10}H_{16}$. Average is 34.7 per cent; theoretical, 34.4 per cent $C_{10}H_{16}$.

In a sample compounded with 40.0 per cent plantation rubber, we found 38.9, 39.8, 37.9, 38.1 and 37.7 per cent $C_{10}H_{16}$. The average is 38.5 per cent, and the theoretical value is 38.3 per cent $C_{10}H_{16}$.*

THE PROCEDURE.

PREPARATION OF THE NITROSITE FOR THE COMBUSTION.

After the rubber

sample has been ground in a meat-chopper to pass a 20-mesh sieve, and 1/2 gram of it extracted 3 hours with acetone, and 1/2 hour or longer with chloroform, the extracted sample is allowed to dissolve in, or thoroughly absorb chloroform. A small Florence flask (75 cc.) is used, which may be about one-half full of the solvent. Nitrous oxide vapors, evolved from dilute nitric acid (specific gravity 1.3) and arsenic trioxide, are then passed through the cooled chloroform until the deep green color becomes permanent for, say, 15 minutes, and the whole allowed to stand over night for completion of the action.

The chloroform is then decanted through a dry Gooch crucible and asbestos mat (the former rests in an ordinary 60 degree filter funnel) into the combustion flask, from which the chloroform is then evaporated by means of a boiling water bath and a dry air current.† Meanwhile the residue in the Florence flask has been similarly dried. The separation of fillers and nitrosite is now brought about in the following way. Small portions (5 cc.) of calcium chloride-dried ethyl acetate are added to the residue in the Florence flask, the latter warmed, and the liquid

*These samples were kindly sent us by the Bureau of Standards.

†J. B. Tuttle, of the Bureau of Standards, has found that the chloroform-soluble residue thus recovered may be very appreciable, and it is to his suggestion that this modification is due.

L. G. WESSON.

E. S. KNORR.

*The article here published represents thesis work done by one of us (E. S. Knorr) in the course for the degree of Bachelor of Science in Chemistry from the Case School of Applied Science.

decanted through the Gooch crucible into the combustion flask, repeatedly, until the filtrate runs through entirely colorless. After evaporation of the acetate (recovery of the solvent as well) the residue is carefully freed from solvent by warming the containing flask in a boiling water bath for, say, 15 minutes, after which 15 cc. of water containing 1 drop concentrated HCl, are added, and quickly evaporated by the use of a boiling calcium chloride bath and brisk current of dry air. The heating is continued at least one-half hour after the residue is again apparently dry.

THE COMBUSTION APPARATUS. This consists of a 200 cc. round bottomed distilling flask, which is provided with a dropping funnel (100 cc.) through a one-holed rubber stopper, and a series of U tubes containing in order: (1) concentrated H_2SO_4 — $\text{K}_2\text{Cr}_2\text{O}_7$, renewed every 1 or 2 combustions; (2) water containing a drop of the preceding; (3) granular zinc; (4) calcium chloride; (5) soda-lime (weighed); (6) soda-lime and calcium chloride (weighed).

THE COMBUSTION. The weighed soda-lime tubes in position, and the combustion flask cooled by water, a volume (20 cc.) of cooled concentrated sulphuric acid is run rapidly into the flask on the nitrosite; then the cooled oxidizing solution of 10 grams pulverized $K_2Cr_2O_7$ in 75 cc. concentrated H_2SO_4 , in a very slow stream. The flask may now be gently warmed by a sand bath to obtain a moderately rapid evolution of gas.* This is done as long as gas continues to be evolved (about one hour), when a carbon dioxide-free current of air, the heating being maintained, is passed via the dropping funnel through the apparatus for at least one-half hour to sweep all carbon dioxide into the soda-lime tubes.

136

Weight CO_2 X $\frac{100}{440}$ X 200 gives percentage $\text{C}_{10}\text{H}_{16}$ in the sample.

We hope, in conclusion, that further study and improvements of this method will eventually give a reliable and not too difficult procedure for the direct determination of rubber, not only in good quality compounds, but also in factice and other inferior substitute-containing rubbers.

*That carbon monoxide is formed during the combustion can be shown by allowing the gases which have passed the absorption train to come in contact with heated copper oxide and then barium hydroxide solution. A precipitate ensues, but the amount is not appreciable for the results of the analysis.

ANILINE METHOD FOR DETERMINATION OF MINERAL FILLERS IN RUBBER.

By Otto H. Klein, John H. Link and Frank Gottsch.

ALTHOUGH the use of aniline as a solvent for vulcanized rubber is not new, there is very little information to be found concerning it in the literature. We have therefore thought that an account of the method as far as it has been worked out, together with some analyses of samples of known composition, would be of interest.

This report should be considered as a preliminary one, as the supply of rubber mixings at hand was limited and other rubber fillers are yet to be experimented with.

In making the determination it is essential that the sample be finely powdered (20 mesh). A one-gram sample is extracted with acetone for four hours, dried at a low temperature, and then transferred to a weighed 100 cc. centrifuge tube. It is covered with 50 cc. of pure aniline and 5 cc. of nitrobenzene, stirred, covered, and heated at 160 degrees C., with occasional stirring until solution is complete.

It is our practice to heat the samples over night in a Freas oven, and in most cases the samples are completely dissolved by the next day. Sometimes the sample dissolves in three to four hours. If the rubber is not yet in solution, it can be seen by stirring with a glass rod. When solution is complete, there is nothing to be seen but fine pigment, free from rubbery appearance.

The chemist who makes the analysis for the first time may be uncertain of himself at this point, but after one or two determinations have been made he will at once recognize any undissolved rubber.

The tube is allowed to cool sufficiently, filled up with ether and well stirred. It is then centrifuged for 15 minutes at 1,500 R.P.M.

The supernatant liquid is decanted, about 25 cc. of ether added and the pigment stirred up completely. It is centrifuged again and the decantate added to the first. Four washings with ether are sufficient. The tube is dried at 100 degrees C., cooled and weighed. The united decantates are evaporated and then ignited in a weighed porcelain or silica dish. The weight of fillers in it is added to that in the tube.

The percentage of fillers plus that of total acetone extract is subtracted from 100 per cent, and the difference recorded as rubber gum.

Latex Rubber.

Aniline differs from other solvents in that rubber dissolved in it forms a thin solution which permits the mineral fillers to separate readily.

Samples *O No. 1* and *O No. 2* are the same, except that *O No. 2* was purposely over-cured. Sample *H* was prepared using the same recipe but by another manufacturer. Sample *H, I* and *J* were unintentionally under-cured. Sample *C* is a hard valve. Sample *G No. 14* contains cauchó rubber.

The small amount of nitrobenzene is used, because it makes solution more rapid. It was found that semi-cured compounds dissolve more slowly than thoroughly cured soft stocks or very hard ones. With under-cured compounds a soft, pasty mass is formed, which is very slow to dissolve, while this does not occur if the material is properly vulcanized.

We found that in a few cases an additional digestion with half the quantity of solvent for five hours reduced the amount of mineral fillers about 0.5 per cent. In specification work it is advisable to make this second digestion after the ether has been expelled from the tube by heating.

Analysis of the fillers shows that the rubber as found by difference will not include the sulphur of vulcanization.

It will be noted that the sum of the percentages of rubber found and organic acetone extract is slightly greater than the percentage of rubber used in the recipe.

The fillers during vulcanization and afterwards in the course of analysis have combined with sulphur to form new compounds. If this combination of fillers and sulphur is a substitution of sulphur for some other acid radical, the resultant product would weigh less than the sum of the ingredients entering the reaction and the rubber found by difference would be slightly greater thereby.

We expect to continue these experiments when other samples are available, and a final report will be made on the subject when we have all the data at hand.

REPORT OF THE JOINT RUBBER INSULATION COMMITTEE.

THE Joint Rubber Insulation Committee, whose preliminary report was printed in THE INDIA RUBBER WORLD, February 1, 1915, has now completed a second report, which was presented in abstract to the Rubber Section of the American Chemical Society on September 29 by William A. Del Mar, the secretary of the committee. The second report, like the first, presents a specification for high-grade rubber insulation for electric wires and cables, and an analytical procedure for use in connection therewith.

The specification is identical with that in the preliminary report, except that the first clause is altered to read as follows:

"A 30 per cent fine Para or best quality plantation *Hevea* rub-

ber compound with mineral fillers, shall be furnished." The change consists in the substitution of "best quality plantation" for "smoked first latex," which appeared in the earlier report.

The analytical procedure has been changed in two important particulars, and a number of minor improvements have been made. One of the changes is the elimination of the terebene method, and the substitution of a modified ash method, for the determination of fillers and rubber. This method is a modification of one devised by G. H. Savage. A general outline of the procedure is given on the diagram below. It will be seen that the residues from the alcoholic potash saponification are treated with hydrochloric acid to remove organic matter, and the part insoluble in acid is dried and divided into two parts, one of which is used to the determination of sulphur, and the other ignited. A sulphur determination is also made on the ash. The rubber hydrocarbons as a percentage of the total sample are given by the following formula:

$$\text{Rubber Hydrocarbons} = 100 \frac{C}{4} \left[1 - \frac{E-F}{D} - \frac{H}{G} \right]$$

The total weight of sample used in the determination is 4g. and the letters *C, D, E, F, G,* and *H* represent the weights in grams of the substance indicated in the diagram.

The other important change is the adoption of the Bureau of Standards nitric acid-bromine method for the determination of total sulphur.

A qualitative test for organic fillers has also been added.

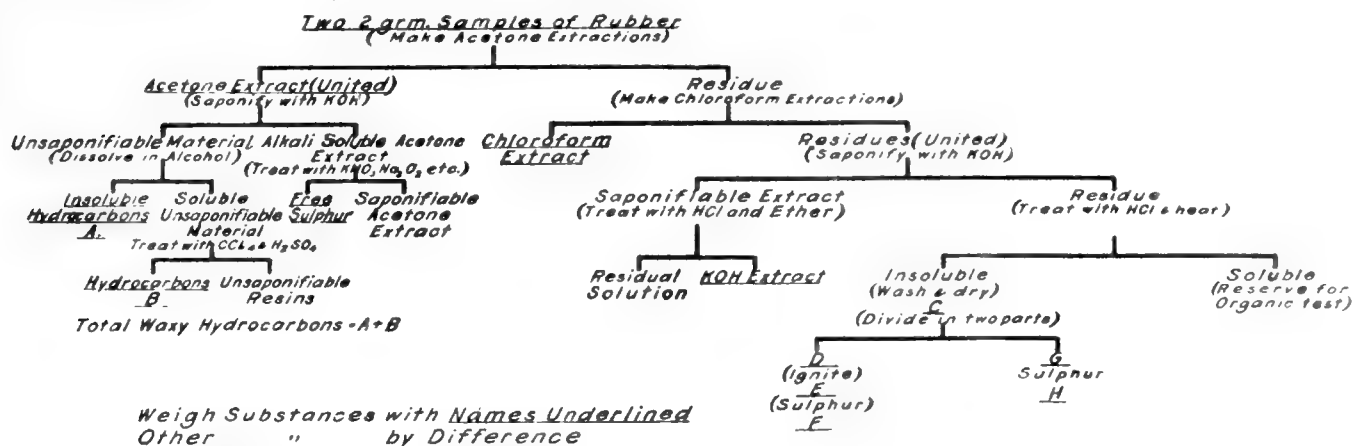

The complete report will not be available until it has been approved by the General Committee, which appointed the Joint Rubber Insulation Committee. It is hoped that arrangements for publication will be made in about a month.

The Joint Rubber Insulation Committee has now been at work for five years and has held 25 meetings, in addition to numerous sub-committee meetings. The committee has been an active one, and its influence has been widely felt, the specification and the greater part of the preliminary analytical procedure being now accepted as standard by electrical engineers and rubber chemists.

The following abstracts from the report read at the meeting of the Rubber Section, give the details of the determination of rubber hydrocarbons and total sulphur, and should be read in conjunction with the preliminary report referred to above.

ALCOHOLIC POTASH EXTRACT.

SECTION 28. Dry the residues from the chloroform extractions at 50 to 60 degrees C. until the odor of chloroform can no longer be detected; unite the residues from the two 2-gram samples in a 200 cc. Erlenmeyer flask. Add 100 cc. alcoholic potash solution and boil for four hours under a reflux condenser. Filter the solution by decantation through an 11 cm. hardened filter paper into a beaker and wash twice, using each time 25 cc. hot

OUTLINE OF METHOD OF RUBBER ANALYSIS EXCLUSIVE OF TOTAL SULPHUR DETERMINATION.

absolute alcohol and then wash thoroughly with hot water. Wash any rubber on the filter paper back into the original flask and reserve this for the determination of rubber hydrocarbons. Evaporate the solution to approximate dryness, take up in warm water and transfer to a separatory funnel. Acidify with 30 cc. 5 normal hydrochloric acid, using this to rinse the beaker. Add sufficient water to make the bulk of the solution 100 cc. When cool add 40 cc. ether, using it to rinse the beaker in 20 cc. portions. Shake the aqueous and ethereal solutions thoroughly. After complete separation, draw off the aqueous solution and treat in another separatory funnel, with a fresh 20 cc. portion of ether. Continue to shake the aqueous solution with fresh portions of ether until a colorless portion has been obtained, then shake out twice more. Unite the ethereal solutions and wash with successive additions of water, continuing twice after the water shows no acid reaction. Filter through a plug of extracted cotton into a tared flask, wash the filter and funnel with ether, evaporate the ether without boiling and dry the residue at 95 to 100 degrees C. Cool in a desiccator and weigh. Continue to dry until constant weight is obtained.

RUBBER HYDROCARBONS.

SECTION 29. Add to the flask containing the rubber residue from the alcoholic potash extraction, sufficient water to make the total volume of the solution 125 cc. and then add 25 cc. concentrated hydrochloric acid. Heat for an hour at 97 to 100 degrees C. Decant the supernatant liquid through a hardened filter paper on a Buchner funnel 7 cm. in diameter, using suction; wash the residue with 25 cc. hot water and decant. (While a Buchner funnel is recommended, it is permissible to use an 11 cm. hardened filter paper with platinum cone, in a 60 degree funnel). Perform this entire treatment with water and hydrochloric acid, three times and save the first and second decantations for the "organic matter" test described in Section 36. The rubber at this stage should be white and practically free from black specks of undissolved fillers; if not, continue the acid treatment until the black specks disappear. (If carbon is present, all the particles of rubber will be grayish, bluish, or black, depending on the form and quantity of carbon used. Black specks in light particles of rubber usually indicate the presence of lead sulphide which must be removed to prevent the formation of lead sulphate on igniting the residue C. Add 150 cc. hot water to the flask and let stand on a steam bath or hot plate for half an hour and decant through the filter paper. Return to the flask any rubber that goes on the filter paper. Repeat until the washings are free from chlorides (See Section 36). Transfer all the rubber in the flask to the filter paper and dry as much as possible by suction. Wash the rubber with 50 cc. of 95 per cent alcohol, using suction. Transfer the entire residue to a weighing bottle. Dry at 95 to 100 degrees C. for an hour, cool in a vacuum desiccator under reduced pressure and weigh. Dry for a half hour, cool and weigh, repeating this process until either constant weight is reached or the weight starts to increase. Let this weight be represented by *C*. On a portion *D* of this residue *C* determine the ash *E*, according to Section 30 and the sulphur *F* in the ash *E*. Determine the sulphur *H* in another portion *G* of residue *C*. Make all sulphur determinations as described under "Total Sulphur."

SECTION 30. Place about 0.5 grams of residue *C* into a weighed porcelain crucible. Let the weight of residue be represented by *D*. Heat gently, gradually driving off the volatile matter. When the crucible has ceased to smoke, raise the temperature gradually to between 450 and 500 degrees C. until all organic matter has been burned away, which is usually indicated by the ash becoming white. (An electric muffle furnace with pyrometer is recommended for this purpose.) Cool in a desiccator and weigh, the weight of ash being represented by *E* in the formula for rubber hydrocarbons. Make sulphur test on ash by the method described under "Total Sulphur." If, however, $50 \times C \times E$ is not

over unity, the determination of sulphur in the ash may be omitted and *F* assumed to be zero.

Then,

$$\text{Rubber Hydrocarbons} = 100 - \frac{C}{4} \left[1 - \frac{E-F}{D} - \frac{H}{G} \right]$$

expressed as a percentage of the total sample.

TOTAL SULPHUR.

SECTION 31. Place 0.5 grams of rubber in a porcelain crucible of about 100 cc. capacity. Add 20 cc. nitric acid-bromine reagent, cover the crucible with a watch glass, and allow to stand for one hour. Heat very carefully for an hour, remove the cover, rinsing it with a little water, and evaporate to dryness. Add 5 grams of the KNO_3 - Na_2CO_3 fusion mixture, and 3 to 4 cc. of distilled water. Digest for a few minutes, and then spread the mixture half way up the side of the crucible to facilitate drying. Dry on a steam bath or hot plate. Fuse the mixture, using a sulphur-free flame until all the organic matter has been destroyed and the melt is quite soft. Allow to cool, place the crucible in a 600 cc. beaker, and cover with water. Digest three or four hours on the steam bath. Filter into an 800 cc. beaker, washing thoroughly with hot water. The total volume should be about 500 cc. Allow to cool, add 7 to 8 cc. concentrated hydrochloric acid to the filtrate, and heat on the steam bath. Test the solution for acidity with Congo paper and add 10 cc. of hot barium chloride solution. Allow to stand over night, filter, wash, weigh the barium sulphate and calculate to sulphur.

INTERPRETATION.

SECTION 34. The percentage of rubber shall be considered to be the sum of the rubber hydrocarbons, saponifiable acetone extract, unsaponifiable resins, chloroform and alcoholic potash extracts, expressed as percentages. If the chloroform extract is over 3.0 per cent of the rubber so calculated, subtract the excess from the rubber. If the KOH extract is over 1.8 per cent of the rubber, as first calculated, subtract this excess also from the rubber.

ORGANIC FILLERS.

SECTION 36. Transfer the first and second decantations of the hydrochloric acid solutions to a carefully cleaned porcelain dish and add 20 cc. concentrated sulphuric acid. Place dish on steam bath or hot plate to drive off water and hydrochloric acid. A pronounced charring of the residue indicates the presence of organic matter soluble in water or hydrolyzed by hydrochloric acid.

Examine filter paper and rubber while decanting acid solution and again while washing free of chlorides. Some types of organic fillers not removed by water and hydrochloric acid, would be plainly visible at this point.

Place a small portion of residue *C* under a microscope and examine for fibrous and other characteristic organic material. If organic fillers are indicated and not clearly proven by this test, place 1 gram of the organic sample in a beaker, add 75 cc. xylol and heat on hot plate until the rubber is dissolved. Decant xylol solution and wash residue with ether several times by decantation. Dry residue and examine under the microscope.

NEW YORK RUBBER MANUFACTURERS BUSIER.

According to the report of the Industrial Commission of the New York State Department of Labor, the manufacturers of rubber and gutta percha goods in that State employed from 16 to 21 per cent more workers from March to August, 1916, than were employed in June, 1915 (the basis of computation), and in each of the months the increase over the same month a year ago ranged from 25 to 40 per cent. The payrolls of these manufacturers ran from 33 to 41 per cent higher than the same months last year.

What the Rubber Chemists Are Doing.

VISCOSITY INDEX OF RUBBER.

THE researches of K. Gorter on the viscosity index as a standard for the preliminary testing of the quality of rubber are abridged as follows, by "Chemical Abstracts" (October 10, 1916). The viscosity index is the logarithm of the viscosity of a 1 per cent solution and is superior as a standard to the viscosity, being less dependent on the temperature than the latter, 1 degree causing a variation in the viscosity index of only 0.005. Hence it is not necessary in viscosity determinations to keep the temperature constant by means of a thermostat. The viscosity index multiplied by the factor 70 gives the tensile strength of the rubber sample. Gorter's viscosimeter consists of a pipette with a 10 cm. capillary stem with an opening 1.42 mm. in diameter, the whole fitting into a 150 cc. Erlenmeyer. The indicated capacity of the pipette is 15 cc., and its constant 9.8 at 26 degrees C. One gram of rubber is dissolved in 120 cc. benzene (not purified from thiophene) with shaking, using a brown flask. The solution is filtered after 24 hours and the concentration determined, after which the viscosity is determined by the pipette. The relative viscosity of a rubber solution equals the period of delivery, divided by the constant of the viscosimeter for the solvent used. The viscosity of a rubber solution is dependent on the dimensions of the viscosimeter used; hence to obtain comparable results the same instrument must invariably be used.

THE WEBER TEST FOR SUN CRACKING DEMANDS PRECAUTION.

D. S. Twiss in the "India Rubber Journal" sounds two important warnings in regard to the use of C. O. Weber's reagent.

The Weber test depends upon the partial oxidation of strips of rubber with a mixture of acetone and an aqueous solution of hydrogen peroxide. Although this mixture is said to keep unaltered for a long time, nevertheless there is a distinct possibility of its deterioration. While acetone-peroxide compound is very soluble in acetone and also other organic solvents, such as ether and benzene, it is only sparingly soluble in water, and because of the presence of water in the Weber mixture, crystals of the compound in a practically pure condition may gradually be deposited after a month or so, some of them continuing to float in the liquid. Of course, the separation of such a crystalline compound causes a diminution in the oxidizing power of the liquid reagent so that tests made with it on various dates may not be accurately comparable.

Great care should be taken to prevent the accumulation of any considerable quantity of these crystals in empty bottles or elsewhere, particularly in a dry condition. Despite the seeming harmlessness of the compound thus formed and the fact that it can even be melted at 97 degrees C., it is capable of exploding with frightful violence if subjected to a shock, or if heated above its melting point. One thousandth of an ounce, when heated in an open test tube, will explode with such force as to shatter the tube, and the explosion of a greater quantity in a large glass bottle would be exceedingly dangerous because of the flying fragments of glass. Obviously the practice of using a freshly prepared reagent not only insures accuracy but personal safety as well.

THEORY OF COLD VULCANIZATION OF RUBBER.

The following abstract of the researches of F. W. Hinrichsen and E. Kindscher on cold vulcanization is from the "Journal of the Society of Chemical Industry" (September 15, 1916).

According to C. O. Weber (in 1894) caoutchouc combines with sulphur chloride to form a series of compounds of which the richest member in sulphur contains 23.62 per cent. Measured

quantities of a solution of purified Para rubber in dry thiophene-free benzene, were treated with quantities of a solution of sulphur chloride in benzene in excess of that corresponding to Weber's formula, and the reaction product was purified as described by Weber. In eight experiments the sulphur content found ranged from 15.58 to 28.37 per cent. In another series of experiments, quantities of the rubber solution containing 0.5 gram of rubber were treated with quantities of sulphur chloride solution containing from 0.433 to 1.299 grams S_2Cl_2 , under conditions to exclude the presence of moisture, and after three or four weeks, portions of the solutions were withdrawn and analyzed. The amount of sulphur chloride fixed by the rubber ranged from 0.2526 to 0.2795 grams, corresponding approximately to the formula $(C_{10}H_{16})_2S_2Cl_2$. The higher results obtained in the first series are attributed to adsorption of sulphur chloride or of sulphur liberated therefrom. The yellowish-white addition compound of caoutchouc and sulphur chloride when boiled with alcoholic sodium hydroxide solution is converted into a dark brown substance corresponding to the formula, $C_{20}H_{20}S_2$. In the technical cold vulcanization process it is considered that adsorption of sulphur chloride by the rubber first takes place, followed by slow chemical combination and by liberation of sulphur from the excess of sulphur chloride. Cold-vulcanized rubber may thus be regarded as an adsorption product of sulphur in a solid or semi-solid solution of the compound, $(C_{10}H_{16})_2S_2Cl_2$, in excess of rubber.

METHODS OF ANALYSIS.

DETERMINATION OF PARAFFIN IN BLACK SUBSTITUTES.

A. HUTIN in "Le Caoutchouc & La Gutta-Percha" contributes the following method for the determination of paraffin and waxes in black rubber substitutes:

Many black substitutes contain paraffin, added intentionally in considerable proportions. Substitutes that contain from 10 to 30 per cent of paraffin break with a section showing small white spots, and are friable. If 30 per cent paraffin is present the mass is whitish. Below 10 per cent no such evidence is visible.

The method of C. W. Weber is used for the analysis of substitutes, modified as follows, for the determination of paraffin. The acetone extract, obtained as usual, is treated with 100 cc. of 97 to 98 degree alcohol; the mixture heated by plunging the container into boiling water and decanting the liquid on a tared capsule. This operation is repeated 5 or 6 times. Evaporate the liquid and dry residue to constant, and weigh.

Paraffin, ceresin and other waxes present are thus obtained together. In general, the material is white or pale yellow and composed of impure paraffin. It is necessary to use 98 per cent alcohol, otherwise the paraffin, etc., will not be wholly dissolved.

RUBBER SUBSTITUTE.

"Chemical Abstracts" (October 10, 1916) gives the following account of the method of H. Bayer (German patent No. 288,968, June 3, 1914) for the manufacture of an improved substitute for rubber. A rubber substitute is obtained from fatty oils, liquid at the normal temperature, as they are employed in the factice manufacture, by treating the balsam-like substance obtained by dissolving and heating sulphur in oil, with an energetic oxidizing substance (preferably dilute nitric acid). The product is soft in the heat, but elastic and tough when cold, and after washing it can be vulcanized with sulphur. The sulphur is at the same time oxidized, as evidenced by the presence of large amounts of sulphuric acid in the nitric acid. This mass is not completely soluble in any of the known solvents, but it swells up with carbon bisulphide, benzene and many other organic

solvents, to a gelatinous, doughy mass which, upon spontaneous evaporation, or evaporation with the aid of gentle heat, to remove the solvent, remains as a homogeneous, very tough and elastic product. This substance, alone or in admixture with solutions of resin, caoutchouc, gutta percha, etc., can be mixed with filling and variously colored. In the swollen state, this mass is mixed with 10 to 20 per cent pure flowers of sulphur, warmed gently, under pressure, on rolls, and, after evaporating the softening agent, it is vulcanized at a temperature slightly above the melting point of sulphur.

For example, 1 kilogram of linseed oil is heated with 150 grams of sulphur at 266 to 320 degrees F., until the sulphur has been completely dissolved, and the linseed oil has been converted into a black-brown liquid, which upon cooling, no longer separates sulphur. This liquid is poured into 3 to 4 times its weight of dilute nitric acid, and warmed for several hours on a water bath, with stirring, until the liquid has been converted into a yellow substance, soft when hot and elastic and tough when cold, and large amounts of sulphuric acid are present in the nitric acid. This product is washed thoroughly with water and dried in a thin layer at 212 to 230 degrees F. Of this mass 1 kilogram is worked up into a gelatinous dough with 200 grams asphalt and 200 grams flowers of sulphur, with the addition of benzene; then dried and vulcanized by heat. The final product is claimed to serve in many cases as a substitute for rubber, and to be much cheaper.

CHEMICAL PATENTS.

THE UNITED STATES.

REGENERATING VULCANIZED RUBBER. The process of regenerating vulcanized rubber which consists in comminuting the material, boiling it in an alkaline solution, and heating the entire mass of material in an atmosphere of inert gas to a temperature approximating but short of the melting-point, and continuously stirring the mass. [Bernadus Johannes Franciscus Varenhorst, The Hague, and Jean Gérard Fol, Delft, Netherlands. United States patent No. 1,198,975.]

THE UNITED KINGDOM.

SUBSTITUTE FOR RUBBER. A mixture of colophony, caoutchouc, sulphur, naphtha, dry white lead or Spanish white is prepared with heat and may be used for sealing wax or in place of ebonite. [R. Castells, 240, Provenza, Barcelona, Spain. British patent No. 7,703 (1915).]

RUBBER RECOVERY FROM RUBBERIZED FABRICS. Rubber is recovered from fabric impregnated with vulcanized rubber, by heating it with boiling tetrachloroethane. Solution of the rubber is complete in about one hour. After removing the fabric, the rubber is recovered from the solution by adding water and distilling off the solvent with the water; or the solvent may be distilled dry, provided care be taken not to overheat the rubber. If desired, the free sulphur may be removed by a short preliminary treatment of the rubberized fabric with hot tetrachloroethane, the operation being interrupted before the rubber begins to dissolve. [C. de Villers, Neuilly, France. British patent No. 10,146 (1915).]

COAGULATING LATEX. In contradistinction to the usual processes employed, the present invention consists in treating the latex with gases obtained by the destructive distillation of wood in suitable retorts, after removal of the tar from the gases.

The advantages of the processes are:

(1) The product obtained is better than that obtained by application of smoke.

(2) As fuel for the distillation of the wood, the charcoal from a preceding distillation can be used. Not all the charcoal, however, is required.

(3) The wood tar obtained forms a valuable product which is available on the plantation for conserving the plants against disease.

(4) The process is cheap. [E. C. R. Marks, 57 Lincoln Inn Fields, London, W.C., England. British patent No. 11,615 (1915).]

UTILIZING WASTE RUBBER. India rubber is removed from tire fabrics, without destroying them, by treatment in *vacuo* with a solvent, at a temperature which produces strong ebullition (212 to 230 degrees F. in the case of xylol). A circulating movement of the liquid is produced by a cone-and-tube device, similar to that used in laundry apparatus. The rubber is first stripped from the fabric by means of xylol or other solvent; the fabric is then treated with cold xylol in an ordinary washer to remove lightly-adhering rubber, resins and free sulphur; next the fabric is placed in a cage in an autoclave containing pure xylol. The autoclave is connected with a reflux condenser which has a pipe connection to a vacuum pump. After heating twice in the autoclave by a steam coil, the fabric is washed in clean xylol, again treated under pressure at about 150 degrees F., and finally washed, and centrifugally treated, dried by means of a current of inert hot gas, and bleached. The liquids containing rubber can be used for dissolving the granular rubber derived from the stripping of the fabric. [H. Debaugé, 2 Rue de Penthievre, Paris. British patent No. 100,961.]

THE DOMINION OF CANADA.

RUBBER VULCANIZATION METHOD. The process of vulcanizing india rubber substance which consists in submitting the substance in the presence of sulphur, sulphides, or other vulcanizing agents, to the action of ultra violet rays, under a variety of conditions of heat, pressure or vacuum in solid films or in solution. [Gustave Bernstein, Chamaliers, Puy de Dôme, France. Canadian patent No. 170,142.]

RECOVERING RUBBER STOCK. The process of recovering rubber stock from vulcanized rubber which consists in bringing the vulcanized rubber in contact with a solution comprising resin and a material obtained by the action of dissolved resin on vulcanized rubber, and incorporating this solution with the comminuted vulcanized rubber and removing the solvent therefrom. [Hermann Goldman, New York City. Canadian patent No. 170,393.]

OTHER CHEMICAL PATENTS.

THE UNITED STATES.

1,200,296. Elastic material for use in tires. Maurizio Barricelli, Bygdö, near Christiania, Norway.

1,200,692. Hard rubber composition. Leo H. Baekeland, Yonkers, N. Y.

THE DOMINION OF CANADA.

171,032. Filler for tires. Frank A. Hager, Portland, Oregon.

THE UNITED KINGDOM.

8,487 (1915). Treatment of latex on scrap rubber. C. A. Icken, East Coast Road, and St. V. B. Down, 43 The Arcade—both in Singapore.

101,127. Impregnating compositions of gutta percha, rubber or balata. E. C. R. Marks, 57 Lincoln's Inn Fields, London, England.

ANOTHER CHEMICAL EXPOSITION IN 1917.

Hardly has the Second National Exposition of Chemical Industries been closed when plans are forming for the third exposition, to be held next fall, and it is said that its success is already assured. An additional floor in the Grand Central Palace, New York City, has been engaged and plans are being made to use this, and possibly another, in addition to the first two floors which were occupied this year. Interesting details of the enlarged scope of the Exposition will appear in due time.

The New York State Industrial Safety Congress will convene at Hotel Onondaga, Syracuse, New York, December 11, 12, 13 and 14. Addresses will be delivered by experts on fire prevention, factory sanitation, safeguarding of machinery and other factors pertaining to industrial safety. Some of the evening lectures will be illustrated. Employers, superintendents and factory foremen are invited to attend.

The Ocotillo Rubber of Arizona.

ACCORDING to report, a San Francisco chemist has discovered that the candlewood shrub, or ocotillo, which abounds in the arid plains of Arizona and New Mexico, contains large quantities of a rubber-like or gutta-like gum, and a company has been incorporated in Arizona for the purpose of extracting this gum and placing it upon the market. The company is to lease nearly a million acres of land in Texas and is attempting to lease State lands in Arizona where the shrub is abundant. As to value of the gum commercially, one story is that it is suitable for the manufacture of chewing gum; another is that automobile tires have been made from it, and so on. Of course there are the usual statements to the effect that this discovery is to revolutionize the rubber industry. The possibility that the gum may have even a minor value leads us to give its pedigree.

THE OCOTILLO (*Fouquieria splendens*).

a, calyx and pistil; b, corolla; c, stamen.

The ocotillo (*Fouquieria splendens*) grows wild from north-west Texas, through New Mexico and Arizona to Southern California, thence south to Lower California and the Mexican States of Coahuila, Chihuahua and Sonora. It is variously known as the vine cactus, coach whip, Jacob's staff and candlewood. In its wild state the shrub grows from 6 to 20 feet high, sparingly branched from the base, the branches up to an inch in diameter, branchless and apparently leafless, their swaying tips brilliant with scarlet blossoms—the flame of the "candle."

The branches are covered with thorns or spines. These are the petioles of the leaves. Like many other desert plants the candlewood has but few leaves, which soon dry and shrivel, and finally fall away, leaving only sharp thorns about an inch long, thus incorrectly classing it as a cactus. It is easily propagated from cuttings, and is much used in Mexico to form an impenetrable hedge. The long, slender stems are used as the substratum over the beams which hold up the grass and clay roofs of adobe houses. It is stated that as much as 400 tons of shrub

can be taken from an acre, and that new growth on that acre will reach maturity in three to five years. It has been known that the ocotillo (to use its Mexican name) yields a resin, a wax and a gum. It is this latter which is now pronounced valuable in the chewing gum business and the rubber industry. A company has been organized for the purpose of extracting it from the bark of the plant by a patented process.

Of much local interest in the city of Phoenix, Arizona, was the "Arizona Tire, a Product of Ocotillo Gum." This was manufactured by the W. C. Hendrie Rubber Co., Torrance, California, and displayed in the show window of a local dealer. That doubters may be forestalled in their unbelief E. W. Snyder, superintendent and chemist of the Sunset Rubber & Supply Co., Los Angeles, California, subscribes and swears before a notary public that:

The tread in this tire is scientifically compounded from ocotillo gum, smoked sheet rubber, sulphur, zinc, white lead, litharge and other compound ingredients commonly used in the manufacturing of automobile tire treads.

As to the great general usefulness of the gum he writes, addressing the Arizona Chicle Gum Co., Mesa, Arizona:

After carefully testing out ocotillo gum, I find that it has a commercial value in the greatest of all industries—the tire busi-

OCOTILLO IN ITS DESERT HOME.

ness. It is a very valuable ingredient for hose, belting and tire frictions, immense quantities of which are manufactured throughout the world. The guayule industry has become one of the leading industries of the rubber business and has proven to be very profitable. The ocotillo gum has a greater field because it

can be successfully used in many other commercial lines. With my experience as a chemist and a practical rubber man, I can give ocotillo gum nothing but the very highest praise.

An interesting point brought out by Judge W. H. Stilwell of Arizona is thus stated:

It is not unreasonable to suppose that rubber produced in this country will meet the demands of the climate and elements more successfully than rubber produced elsewhere.

J. D. Crawford, whom "Arizona" describes as an American chemist and wage earner in the rubber industry, is given the credit of the discovery of the ocotillo as a rubber producer. Mr. Crawford, so says "Arizona," discovered the value of guayule and "sold his processes to the Madero brothers for a small consideration." His discovery of guayule is 18 years old, that of ocotillo is 3 years old.

The plan of the Arizona Chicle Co. is not to manufacture either chewing gum or automobile tires. Instead it will extract the gum and sell first to manufacturers of the articles named and later to any and all who find the gum of use. The initial plant is planned for a daily capacity of 600 tons.

H. E. Shrum, of Phoenix, Arizona, who has charge of the sale of stock, kindly sent the editor of THE INDIA RUBBER WORLD a small sample of the bark of the ocotillo plant and a piece of vulcanized rubber. Whether this was a bit of the tire compound cited above does not appear. He further stated that the company expected to be producing gum by the first of the year. As to the cost of the gum, it is stated that it can be produced in quantity for 10 cents a pound.

If this project proves successful in adding to the sources available for the production of rubber, or even plastics from plants indigenous to our own country, it will certainly be well worth while. Perhaps this desert "cactus" may become as valuable as the once neglected guayule shrub which has proven of such substantial use in the rubber industry.

In the meantime the rubber trade awaits with interest elucidation of the following points:

FIRST—What percentage of ocotillo gum entered into the composition of the "Arizona" tire.

SECOND—Would it be possible to make a tire or anything else in rubber using ocotillo gum, and compounding and curing it without the addition of "plantation sheet" or any other rubber?

A frank answer to both of the above will tell the story of the value of the gum beyond peradventure.

RUBBER GLOVES FOR X-RAY SURGICAL OPERATIONS.

Rubber gloves for surgical operations where X-rays are used are made opaque to these rays by being impregnated three or four times, at intervals of about a half hour, with a paste obtained by thoroughly mixing the following ingredients in a chemist's mortar:

100 grams finely ground lead carbonate.

50 grams of rubber solution (similar to solution used for repairing cycle tires).

50 grams of light mineral oil.

Large size surgeon's gloves need from 40 to 50 grams of paste each; the paste is applied with a soft brush, preferably on the interior surface of the gloves, the latter being turned inside out and filled with talc or a similar powder. The paste adheres better when the surface has been coated beforehand with diluted rubber solution.

This paste is not affected by prolonged contact with water containing phenol, nor by strong alcohol, but it blackens if the gloves are placed in boiling water for any length of time, and then it develops a tendency to crack when the gloves are stretched in any way.

In French military hospitals many doctors coat their hands with the paste above described before putting on their rubber gloves. The paste can be easily washed off by using mineral oil. ["Journal de Pharmacie et de Chimie."]

THE ELECTRICAL EXPOSITION.

FOR two weeks in October the Electrical Exposition and Motor Show of 1916 was held in the Grand Central Palace, New York City. As in previous similar exhibitions, this served to show the progress in electrical achievements during the year, many exhibits being particularly interesting and attractive. Out of a total number of 105 exhibitors there were some which were more or less related to the rubber industry. Among these might be mentioned the following:

The Habirshaw Electric Cable Co., Yonkers, New York, exhibited a very complete line of samples of rubber insulated cables, including the large armored cable made for the Interborough Rapid Transit Co. and laid under the Harlem River; and a sample of the submarine cable made for the Signal Department of the United States Government. This cable was made and tested at the Habirshaw works in one piece, 34 miles long, which is now in service in the Philippines.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, exhibited a large number of electrical devices for the modern residence, office and factory. Electric fans, motors, transformers and rectifiers for charging storage batteries were also shown, as well as lightning arresters for the protection of electrical circuits, lighting fixtures for street use, and motors for various industries.

The General Electric Co., Schenectady, New York, showed the modern application of its Mazda lamps, of various capacities. A mechanical display showed exactly what the consumer gains by the use of these over other lamps, as demonstrated by the use of a mechanical meter. An electrically lighted fountain, an electrical clock, a reproduction of a modern show window illuminated with miniature lamps, X-ray plates, motors, generators and transformers completed the exhibit.

The Electric Storage Battery Co., Philadelphia, Pennsylvania, displayed a large number of storage batteries of its manufacture, those used in submarine vessels, in electric vehicles, in mine locomotives, and also for central lighting and power stations for telegraph and telephone service. There were also various batteries used for automobile starting and lighting, wireless telegraphy, fire alarm and gun firing.

Another storage battery was the "Edison," shown by the Edison Storage Battery Co., Orange, New Jersey, which is used in a great variety of ways for lighting and motor power in vehicles, boats, etc., and for supplying current to modern searchlights, telegraph, telephone, time clocks and light machinery. The Edison electric safety mine lamp was also shown.

The New York Edison Co., New York City, showed the work of its various bureaus in a very comprehensive exhibit, demonstrating the capabilities of its service. For instance, there was a completely equipped electrical hospital, an X-ray room, an electro-mechanical gymnasium, a dental hospital, and a photographic studio. A three-room apartment, in miniature, was shown, furnished with figures, furniture and electric fittings, all arranged to show the different lighting effects.

The vacuum cleaner would be far from practicable were it not for the rubber hose which gives it portability. The Frantz Premier Co., Cleveland, Ohio, and the Hoover Suction Sweeper Co., New Berlin, Ohio, had exhibits of these machines. Rubber tubes form a part of the electrical milking machines which were seen in operation in the Dairy division, several prize Guernseys and Holsteins being exhibited by a well-known condensed milk company.

The S. S. White Dental Manufacturing Co., Philadelphia, Pennsylvania, among other items of its exhibit of a modern dentist's office, showed an electrically heated rubber tube for conveying the gas administered to patients at about the temperature of the body, thus lessening excitement and irritation. Prepared rubber and rubber dam for dental purposes were also shown.

New Machines and Appliances.

A DUTCH TYPE TWO-ROLL PLANTATION WASHER.

MACHINERY builders in Holland are keeping pace with the ideas of modern design and construction of rubber washing machines. The illustration clearly shows a strongly built, standard machine that is capable of giving durable service.

The heavy, cast iron bed-plate is of the one-piece pattern and supports the side frames in which are mounted the journals for

the two rolls. These are made of deep chilled iron, measuring 12 by 18 inches, accurately turned and diamond corrugated. The adjustable roll is taken up by two powerful screws mounted in the side frames and operated by a cross shaft and hand wheel. Provision is made to prevent oil from coming in contact with the rolls.

The machine is underdriven and controlled by a lever friction clutch tested to stand 18 horse-power. It is driven by a steel pinion on the main shaft that meshes with the main gear keyed to the back roll. Both gears are of the double helical cut type and a safety screw prevents breaking of the gear teeth when subjected to unusual strain. The front roll is driven by gearing from the back roll, and a cover that completely encloses both gears prevents accidents. A perforated pan is provided for catching the rubber as it passes between the rolls, and a strainer box retains the smaller particles that fail to mass.

The machine weighs 5,000 pounds and when packed for shipment measures 61 by 55 by 48 inches, and an additional crate measures 92½ by 7¾ by 7¾ inches. [J. L. Nering Bogel & Co., Deventer, Holland.]

HIGH PRESSURE COUPLINGS AND THROTTLE VALVES.

Reliable hose clamps and dependable throttle valves are indispensable equipment where high pressure strain or compressed air is used. A clamp that will not blow off under high pressure or give way through long service is essential. Such are the claims made by the manufacturer of "Boss" couplings. Its parts

are few, comprising spud, stem, nut and clamp,—the long stem affording ample hose-gripping surface and the dovetail clamp accommodating a variety of outside hose diameters. For hose

with extremely thick walls or with woven cotton cover, special clamps are furnished.

"Boss" throttle valves are also constructed with the object of giving satisfactory service under high pressure and rough usage. The walls are extra heavy and the thread shoulders reinforced to withstand unusual strains. While operating freely, these valves will not close nor open by vibration. [Dixon Valve and Coupling Co., Philadelphia, Pennsylvania.]

COMBUSTION STOVE FOR SMOKING RUBBER SHEET.

There are various methods and appliances used in smoking rubber that has been prepared in the form of sheets. On most plantations the smoke is applied externally to the rubber that is suspended on racks or poles in a smoke house. The stove shown in the illustration produces clean, sparkless smoke by the combustion of wood, coconut husks or similar material. It is strongly constructed of metal and supported by four legs. The fuel chamber, which occupies the lower part of the stove, is provided with grate bars, draft regulating slide for controlling the volume and temperature of the smoke, and a fuel charging door. The upper part of the stove contains the spark arrester, which retains and precipitates all solid substances in the smoke. Ash trays are provided that may be easily lifted off, that their contents may be emptied at intervals. The smoke outlet at the top is designed to fit an ordinary 5-inch stove pipe. [United Engineers, Limited, Ipoh, Federated Malay States.]

THE PIONEER DUSTLESS GRINDER.

The self-contained motor driven grinding machine here shown has several features that doubtless would find favor and practical utility in a rubber factory, not only in the machine shop and pattern room, but, for example, in smoothing off the fin that is left after trimming molded goods, and also rough grinding hard rubber articles with plain surfaces.

The machine is adapted to be placed on a bench within easy reach, and starts at full speed by the touch of a button. It is provided with a vacuum dust collecting system that carries the dust to a removable settling pan located in the column of the machine. The tilting table is equipped with a graduated adjustable angle gage, operated by a small hand wheel. Locking levers are provided to hold the table firmly in any position, while the entire mechanism is supported on a square column upon which it

is adjusted vertically. The following are the particulars: Diameter of disk, 9 inches; base, 9 inches square by 8 inches high; height over all, 15 inches; table, $4\frac{1}{2}$ by $11\frac{1}{2}$ inches; vertical

adjustment, $4\frac{1}{2}$ inches; angle adjustment, 15 degrees upward, 45 degrees downwards; single phase, 60 cycle, 220 volt motor. [The H. A. Smith Machinery Co., Syracuse, New York.]

M. & W. RATCHET WRENCH AND ROLL ADJUSTING SCREWS.

Adjustment of the rolls of heavy washers, mills and refiners is a matter that requires force and considerable skill. The powerful screws controlling the roll adjustments are usually operated by hand wheels or bar levers attached to the screw heads and, moreover, power is sometimes used to aid in coarse adjustments.

In the accompanying illustration is shown a combination ratchet wrench and adjusting screw of standard size and thread that readily recommends itself to mill users. It is undoubtedly a time saver as well as a powerful tool for conveniently obtaining both coarse and fine adjustments of the rolls.

Carefully selected materials are used in construction of this device, the lever being cast steel, the cover plate, steel, the screw, vanadium steel, and the pawls and shifter levers, drop forgings. [Morgan & Wright, Detroit Rubber works, Detroit, Michigan.]

MACHINERY PATENTS.

GAMMETER'S INTERNAL PRESSURE VULCANIZING APPARATUS.

Hollow rubber articles are cured while subjected to internal fluid pressure, according to this invention, which is here illus-

trated and described, as applied to the making of tire casings. The drawing is a cross-section of a two-part tire mold *A*, showing casing *B*, core *C*, and the round flask *D*, containing carbon dioxide.

The flask is charged in a separate apparatus and a fusible plug *E*, inserted. One end of the flask is connected to the pipe *F* that conveys the gas under pressure to the space between the core and the casing. The other end of the flask is supported by a stud *G*.

The heat of the steam immediately melts the plug and releases the gas, which applies pressure to the inner part of the casing during vulcanization. [John R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,200,603.]

ULTRA-VIOLET RAY VULCANIZER.

Solutions of india rubber are vulcanized by ultra-violet rays, care being taken that the operation is not continued sufficiently long to injure the rubber. The sulphur employed may be replaced

by any sulphide which is decomposed by the rays; for example, carbon, allyl, or antimony sulphide. Very dilute solutions of the vulcanized rubber thus obtained; for example, 0.5-0.6 per cent, may be used for cementing, and only a very thin cementing layer is required.

A maximum of 1.25 per cent is claimed. The illustration is a sectional side elevation of the apparatus, which may be employed for treating any liquid or solid product in thin layers with ultra-violet rays.

It is an enclosed machine supported by suitable standards, and underdriven by a longitudinal shaft located on one side of the casing. Keyed to the shaft is a worm that engages a worm wheel driving the drum *A*, which also drives the opposite drum *B* by sprocket gearing. The endless belt carrier *C* passes around these drums and is driven by them. The product to be treated being introduced through the hopper *D*, is carried by the endless belt over the adjustable guide roller *E*, down and all around the quartz mercury vapor lamp *F*, then over the adjustable guide roller *G* and around the drum *B*. The material is removed from the belt by a scraper *H* and delivered to a receptacle *I*. [H. P. M. A. Olivier, Paris, France. British patent No. 7,823 (1915). Not yet accepted.]

APPARATUS FOR EXHAUSTING THE INTERIOR OF RUBBER ARTICLES.

In many processes of pressure cure, as applied to the manufacture of boots and shoes, hollow perforated forms of special construction are used. The present invention, however, provides a device that permits the use of solid forms or lasts such as are commonly used in footwear manufacture. The accompanying drawing is a side elevation partly in section, showing this device applied to a solid boot form.

The metal cap *A* is adapted to fit over the boot form *B*, and comprises a vacuum chamber *C* and a tapered, wedge-shaped conduit *D* which separates the boot from the form and establishes communication between the inner surface of the boot and the vacuum chamber.

The metal cap is provided with a tapered nozzle *E* that fits over a tapered nipple *F* and low pressure or a vacuum is supplied from the pipe *G*. A seal *H* laps the edge of the boot to insure a tight joint during application of the preponderating outside pressure. [Chester J. Randall, assignor to The Goodyear's Metallic Rubber Shoe Co., both of Naugatuck, Connecticut. United States patent No. 1,199,420.]

PROCESS PATENT.

METHOD OF MAKING DOUBLE TEXTURE FABRICS.

The manufacture of double texture fabrics is a particularly difficult process when one of the fabric layers is thin or loosely woven, as is the case with mohairs employed in automobile tops.

These difficulties are provided against by the present method, which is described in connection with the accompanying illustration of a spreading machine.

From the supply roll A, the fabric B passes under the spreading knife C, which distributes a thin coating over the upper surface. The fabric then passes around the drying table D, and down and around idler rollers E to a second spreader F that applies to the coated surface a thin film of highly adhesive rubber solution. Before this is dry the fabric is passed under pressure roller G, where it meets and is superposed by the face fabric H

fed from supply roll I. The double fabric then travels around a guide roller J, the heated drum K and the guide roller L, to the tensioned wind up roller M. [James Meade, Stoughton, Massachusetts. United States patent No. 1,199,400.]

OTHER PROCESS PATENTS.

THE UNITED STATES.

- 1,199,249. Fibrous rubber material for use in the manufacture of water-proof sheeting, tubing and the like. J. W. H. Dew, London, England.
- 1,199,922. Rubber article and process of making same. R. B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Ind.

THE UNITED KINGDOM.

- 7,477 (1915). Endless bands of canvas and rubber. T. Sloper, Southgate, Devoizes, Wiltshire.

THE FRENCH REPUBLIC.

- *480,402 (December 7, 1915). Improvements in processes to suppress porosity in rubber goods. Boston Rubber Shoe Co.

THE GERMAN EMPIRE.

- 288,418 (May 11, 1914). Horse-hair net is worked up with rubber to impart strength to it. E. Forz.

MISCELLANEOUS PATENTS.

TOY BALLOON VALVE.

A device for closing the air or gas inlet to toy balloons, punching bag, or football bladders, and other inflatable articles of rubber, is the subject of this invention. This metal closure device

[Robert Head, New York City, assignor to Howe-Baumann Balloon Co., Newark, New Jersey. United States Patent No. 1,201,045.]

FRENCH TYPE CHAINS FOR DUAL SOLID TIRES.

A recent French patent covers articulated, detachable non-skid chains for motor vehicles equipped with dual solid tires.

This chain comprises a series of non-skid plates connected by chain sections with special links provided at regular intervals for fastening the chain to the rim of the wheel. The chains occupy the annular space between the dual tires as shown in the diagram.

The drawing on the left is a circumferential section and on the right, a transverse section of the wheel. A is the rim, B the

spokes, C the tires and D the non-skid plates that are connected by chain sections E. These sections are anchored by short chains F to double links G, located at spaced intervals in the rim between the dual tires. The links are fastened in the rim by taper keys H, that are held in place by straps or cotter-pins. [Société Schneider & Cie. French patent applied for February 29, 1915.]

Editor's Book Table.

STRAIGHT AMERICA. A CALL TO NATIONAL SERVICE. By Frances A. Kellor. The Macmillan Co., New York City. [200 pages.]

THIS book contains much interesting matter well worth the attention of every citizen of the United States. Its scope is defined by the following extract from a prefatory letter written by Ex-President Roosevelt. It says: "Emphasis is rightly laid upon the need of nationalism in all of the big questions of the day, from education to industrialism, for we cannot have a real American citizenship unless that citizenship is emphatically national. We cannot deal with immigration, unless we deal with it from the standpoint of a national Americanism. We cannot solve our industrial questions, especially the question of transportation, including all questions of interstate industrial enterprise engaged in manufactures and commerce, except from a national standpoint."

OFFICIAL AMERICAN TEXTILE DIRECTORY, 1916. COMPILED by the Textile World Journal. Bragdon, Lord & Nagle Co., New York City. [Flexible cloth covers. 8vo, 650 pages. Price, \$2.]

This directory, which is published annually, gives a large amount of valuable information regarding the textile industry of the United States. This comprises nearly 7,000 establishments, including not only cotton, woolen, silk, flax and jute mills, but establishments devoted to dyeing, finishing, bleaching, printing and other branches of the textile industry. Full information is given regarding each of these mills, the names of officers, agents, superintendents, and the character of the goods made, and such other items as the number of spindles, looms, whether the mill uses steam or water power, etc. The book is arranged geographically, alphabetically, and according to style of goods manufactured, and will undoubtedly be found extremely useful to all engaged in these industries.

AUTOMOBILE NOMENCLATURE. THE SOCIETY OF AUTOMOBILE ENGINEERS, New York City.

Confusion frequently arises from lack of uniformity in naming and describing parts of automobiles, and one of the objects of the Standardization Committee has been to decide upon the terminology for universal use in such descriptions. The report of this committee gives a list recommended by the Society of Automobile Engineers which contains over 600 separate names of the more important parts, this list being developed through the combined efforts of engineering and service representatives from a number of the leading automobile manufacturers. Undoubtedly it will serve to prevent confusion and to enable automobile owners, dealers and manufacturers to more accurately and thoroughly understand exactly what is meant by various terms.

HENDRICKS' COMMERCIAL REGISTER OF THE UNITED STATES for Buyers and Sellers. S. E. Hendricks Co., Inc., New York City. [4to, 1,738 pages. Price \$10.]

With the present number, this standard publication rounds out a quarter of a century of usefulness. The work is especially devoted to the interests of the architectural, contracting, electrical, engineering, hardware, iron, mechanical, mill, mining, quarrying, railroad, steel and kindred industries, containing about 350,000 names and addresses, with upward of 45,000 business classifications. These lists contain the names of concerns handling the various products of these industries from producer to retailer. An innovation is a list of trade names, brands and titles of identification, this portion of the book being printed on a tinted paper, so as to be easily and quickly identified by the user, and numbering 202 pages, or in the vicinity of 10,000 names. This list includes many trade names of specialties manufactured of rubber. Automobile and motor car names are given in a sepa-

rate list in another portion of the book. The book will be found of value to buyers of the various classes of goods and materials in the industries of which it treats.

GREEN MANURES AND MANURING IN THE TROPICS. BY P. de SORNAY. Translated into English by F. W. Flattley. John Bale, Sons & Danielsson, Limited, London, England. [Large 8vo, 466 pages. Price, 16s. net.]

In India, Malaya and the West Indies and throughout the tropics and sub-tropics generally, the question of manuring is an important one. This book which treats the cultivation of the *Leguminosæ* crops, is one which gives much information regarding this special method of feeding nitrogen to the soil. Many queries are answered in this book, which will enable the planter to solve some of the difficulties of enriching the soil. The work will be found helpful to those who would learn how to cultivate legumes, either for seed and oil, fodder, cover-crops, or as green manures. There is a very complete index and also a table of French and English equivalents which will be found useful for reference.

INDUSTRIAL ACCIDENT PREVENTION. ISSUED UNDER THE direction of the Industrial Commission, New York State Department of Labor. [54 pages.]

The Industrial Commission of the State of New York has issued a pamphlet which gives in condensed form a vast amount of information regarding industrial accidents and many suggestions for their prevention. The causes of such accidents being given, such precautions are suggested as mechanical guards, industrial hygiene, prevention of fatigue of employees, their welfare and safety, education of illiterate workmen, and the advertising of safety by various means, such as bulletin boards, pictures, danger signs, letters in pay envelopes, books of rules and moving pictures. Workmen's committees are advised for seeing that safety suggestions are carried out, and education in first aid to the injured is also advised. The book is one which will be advantageously read by every employer of labor.

A NEW RUBBER PLANTERS' JOURNAL.

"The Nederlandsch Indisch Rubbertijdschrift" (The Netherlands India Rubber Journal) is a new bimonthly publication devoted to the increasingly important rubber problems of Holland and her colonies. The new bimonthly is under the management of K. L. F. Goelst, and W. J. Van den Leemkolk, and is published in Batavia, Java. It is the first paper devoted to this industry to be published in the Dutch East Indies, and is the official organ of the Rubber Planters' Association there.

The contents are largely signed contributions from practical men in various branches of the rubber industry. There are essays on selection of seed, planting, tapping, cultivation, diseases of *Hevea*, coagulants, accelerators, vulcanization, besides general articles on the future of planting in the Netherlands Indies, and profits and losses in management. The market and statistical departments are very comprehensive, and here the Dutch headings are supplemented by English translations, to render this information more widely available. The new publication starts out with an excellence which bespeaks for it a useful and prosperous future.

PAN-AMERICAN MAGAZINE RUBBER ARTICLES.

The "Pan-American Magazine," New York City, for September has finely illustrated articles on "The Rubber Industry of the Amazon" and "Impressions of Manaos," both by L. E. Elliott, F.R.G.S., together with an article on "Old Travelers on the Amazon," the last-mentioned relating to the explorations of early travelers in the first half of the nineteenth century.

NEW TRADE PUBLICATIONS.

THE General Electric Co., Schenectady, New York, is sending out Bulletin No. 44,419, which is devoted to gears and pinions. It is of the usual excellence of the publications on trade matters sent out by this company, being fully illustrated, giving much information regarding the manufacture of gears, the technical requirements, and diagrams showing comparative sizes of gear and pinion teeth, graphically shown in exact size.

* * *

The Firestone Tire & Rubber Co., Akron, Ohio, has sent to all its agencies a novel window hanger, showing, in a tabulated arrangement, the prices of its leading sizes of tires. The hanger is about 20 by 25 inches, printed in brilliant colors, and the figures are large enough to be easily read from a distance.

* * *

"Bulletin Sales Service" published by the Faultless Rubber Co., Ashland, Ohio, dated October, 1916, gives full plans for an opening celebration which may be put in operation by any druggist with such assistance as is afforded by the Faultless company. Full details are given as to the advertising, both in the local newspapers and in the stores, and for the latter purpose printed matter, window cards and prize tickets are furnished, suggestions being given regarding combination offers and free souvenirs which have been found practicable and not too expensive where others have held similar openings. Pictures and descriptions are given for arranging attractive rubber goods window displays and a reproduction of an advertisement is shown which will appear in a large number of national magazines during November, and the advice is to hold the opening on November 11, thus taking advantage of such advertising.

* * *

The J. P. Devine Co., Buffalo, New York, is distributing its Bulletin 105, which treats of apparatus required by the chemical and allied industries. The booklet gives in detail such apparatus as cast steel autoclaves, reduction kettles, nitrating, sulphonating and fusion kettles, vacuum pans and evaporators, steam jacketed pans, digestors, etc. Like all of the Devine publications, it is excellently arranged and beautifully printed, each page showing a finely drawn illustration of the article described.

* * *

The Link-Belt Co., Chicago, Illinois, has issued two finely printed and illustrated pamphlets describing the modern coal and ashes handling machinery which that concern has recently installed for the Victor Talking Machine Co. at Camden, New Jersey, and for the W. H. Grundy Co., Bristol, Pennsylvania.

* * *

"A Visit with the Firestone Organization, Its Men—Its Factory—Its Branches" is the title of a large, handsome and profusely illustrated brochure recently issued, primarily to show the progress in method and machinery which has helped so materially toward giving the utmost in tire service at the lowest possible cost. Nor has the personal equation been forgotten in this review. Firestone success depends upon the health, happiness and personal responsibility of every worker in the organization from H. S. Firestone down to the office boys, quite as much as upon improved machinery and scientific management, and so considerable space has been devoted to the operatives in the various departments, both at work and at play. They have a splendid club house across the street with assembly hall and dining rooms, a barber shop, swimming pool, facilities for the enjoyment of every healthful indoor exercise and recreation, free medical and dental treatment and several other benefits.

Beginning with the man who alone controls the unloading of coal and feeding of a battery of boilers of 12,000 horse-power capacity, one is shown by word and picture the efficiency methods and devices at every point in the making of a motor car tire

which have made Firestone quality, prices and volume of business what they have become in 16 years. Painsstaking thoroughness and rigid standards are everywhere to be seen—in the purchase of all raw materials; the washing of crude rubber; the supply of filtered water and filtered air always at proper temperature; ample drying of the sheeted rubber; careful mixing; proper aging of the mixed rubber before use; calendering more than once for thin sheets; constant inspection and frequent tests of sheet rubber and fabric; exact cutting of side wall rubber to size and of fabric on the bias to insure greater strength and resiliency; absolute uniformity of vulcanization; thorough inside painting of cases and a rigid final inspection. Firestone rims and truck tires are also produced in the same thoroughgoing manner, according to standards laid down by a body of skilled chemists and engineers.

The importance and method of scientific drying and frictioning of the fabric to extract all atmospheric moisture without impairing the natural tensile strength of the cotton before filling with rubber are particularly emphasized, while the tire building machine which puts on every layer of fabric at uniform tension has been properly termed an epoch-making invention. Indeed, the volume, the precision and the output would be impossible without the varied and wonderful types of improved machines which work in large batteries under the watchful eyes of men of superlative skill, experience and loyalty.

* * *

The B. F. Goodrich Co., Akron, Ohio, has published a pamphlet, entitled, "Devices That Make for Motor Truck Efficiency," which is a reprint of a portion of the larger book, "Motor Trucks of America," the edition of which was exhausted before all requests for it could be filled. The pamphlet shows various auxiliary devices for loading, whereby the trucks can be quickly loaded, carry much and deliver expeditiously. Clear and explicit drawings illustrate these various devices.

* * *

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, is sending to dealers a large four-page folder, describing in particular the merits of the company's latest automobile tire—the Bar-Circle. The cover shows a representation of this tire, which, as the name indicates, has a tread design composed of alternate bars and circles; the descriptive lettering being in contrasting colors. Within the folder, red and black lettering against the cream background brings the advertising matter into striking prominence, and the tread design is carried out as a border. The Vacuum Cup and Ebony treads are also shown. Prices on the Bar-Circle are given, and an order post-card is attached to the folder by sealing at one end.

* * *

The Brunswick-Balke-Collender Co., Muskegon, Michigan, is sending out its first piece of trade literature to advertise its Brunswick tires. This is a handsome hanger, lithographed in several brilliant colors and measuring about 24 by 36 inches. The principal figure is a huge tire showing the novel tread. In one corner is a picture of an English style country house in front of which stands an automobile. The shield trade-mark is also shown in red and yellow, with an Old English initial in black. Appropriate wording is given and the whole forms a brilliant and effective piece of advertising.

* * *

"Oral Hygiene," a neat little journal devoted to the dental profession, in its October issue, has a long article telling of the work done by the Forsyth Dental Infirmary in Boston, Massachusetts, for the members of the Massachusetts militia prior to their departure for the Mexican border. The article shows several illustrations of the infirmary, and the dentists operating upon the army men, and in one picture is shown the founder of the institution, Thomas A. Forsyth, president of the Boston Belting Co.

Interesting Letters from Our Readers.

THE MECHANICAL RECLAIMING PROCESS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I have read with much interest the report of your address at the chemical meeting. Your reference to the "pioneers" of the rubber industry is most pleasing. But are you not mistaken in naming Mr. Clapp as an inventor in the reclaiming process? He was one of the pioneers beyond question, but he acquired his knowledge of the business through J. B. Forsyth as I understand it. Mr. Forsyth one day gave me a detailed account of how he was the first one to reclaim rubber and how the health authorities of Boston compelled him to discontinue the work at Roxbury on account of the odor arising from it. Thereupon he persuaded and assisted Mr. Clapp to engage in the business at Hanover and was the sole user for a while, but later admitted the Boston Shoe Co. to a supply.

The Boston Shoe Co. had three years' start of its competitors in use of reclaimed and that was the basis of its subsequent prosperity.

It was very clear from Mr. Forsyth's statement that the process had its origin at Roxbury, and that Mr. Clapp was associated at Hanover, as a matter of friendship, to establish him in the business.

GEORGE WATKINSON.

[A pioneer in rubber himself, Mr. Watkinson brings up a very interesting point, and we are more than pleased to give the reason for our faith. We believe that Eugene H. Clapp was the real inventor of the "mechanical process" in reclaiming and this is why:

The real beginning of the reclaiming of vulcanized scrap was accomplished by Hiram Hall at the Beverly Rubber Works in 1858. The scrap was ground fine, boiled in hot water, (later it was devulcanized in hot steam), mixed with tar, spread on cloth and "solarized." Later J. B. Forsyth reclaimed vulcanized scrap, but did not remove the fiber. Eugene H. Clapp, who was a close friend of Forsyth, as Mr. Watkinson states, took over the grinding and devulcanizing of scrap for the Boston Belting Co., and did a small business. While doing this he invented the "air blast" process which removed all of the fiber and produced a far superior stock, that was at once in demand. The "air blast" he kept secret for several years and built up a big business because of it. In other words, he was the first to produce "mechanical" reclaimed rubber that could be used in general work, and for many years was the only source of supply for the trade.—THE EDITOR.]

THE RUBBER CHEMIST'S PROBLEMS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—In your recent address before the rubber chemists, published in the October issue, the introductory letter, which you describe as coming from an old-time rubber superintendent, appeals to me as being somewhat peculiar. Its contents may be judged from different points of view, and in replying it would hardly be fair to assume either that his attitude is wholly incorrect or yet quite correct.

The most difficult position among the many branches of industrial chemistry is doubtless that of the rubber chemist, the more so because of a seeming unwillingness in certain quarters to accord credit where credit is due.

In most modern industries it has been found necessary to analyze the raw materials, and, in very many cases also the product, as, for example, fertilizers, rubber goods, beers, etc. Many years of such analysis have developed standard methods, and today a chemist working in a fertilizer factory has his daily routine carried on automatically, yet his work is correct and valuable, but his position simple.

An entirely different proposition confronts the rubber chemist.

Certainly most rubber chemists do routine work only, and many even think that is all there is to be done. Of course, to analyze crude rubber and other raw materials, such as mineral fillers, substitutes and specification goods, routine analysis is sufficient. But considering the intricacies of compounding, vulcanization, etc., this requires altogether more varied activity and knowledge than any routine work in other branches of industrial chemistry. But this is not all a real rubber chemist has to do. We must remember that many mechanical rubber goods are used in almost every industry, and some are subjected to various chemical processes. Any practical rubber man must admit that there come daily different complaints and questions, as, for example, can you make rubber rollers which will stand 73 per cent sulphuric acid, or rubber hose to withstand the action of acetic acid, or rubber washers to withstand chlorine gas, and hundreds of similar queries. Who should solve these problems? Would it not be hopeless to mix, without any chemical knowledge, dozens of compounds just to try them out, or should we give to the customer anything we may believe may do? We often hear that factories offer acid hose, one compound hose for all acids, like a single remedy for all sicknesses; and yet it is a fact that a compound which will withstand concentrated hydrochloric acid will not withstand 20 per cent acetic acid and vice versa. Since satisfactory service is the best fundament for business, every detail must be worked out. So here we have examples of the great difficulties rubber chemists have to meet, and while, to solve such problems, depends more upon individual capability than experience alone, it so happens that the chemist occasionally fails to solve such problems; and if the chemist fail, what chance has a practical rubber man without any chemical knowledge? But even though a manufacturer has had unfortunate experience with one chemist, this does not justify him to judge all the rest by the same measure.

I have cited here only a few examples of daily occurrence in rubber factories, but there is an unlimited field for research work on such problems as you described in your address. We live in progressive times and are forced to be progressive in order to meet competition; and, since the rubber industry is closely allied to chemical industry in general, a good chemist is absolutely necessary to keep the factory up to date. Although a poor chemist is just better than none, a good one will prove one of the best possible investments.

D. REPOY.

Passaic, New Jersey, October 13, 1916.

JUDICIAL DECISIONS.

MILLER RUBBER CO. AND OTHERS V. CITIZENS' TRUST & SAVINGS BANK. This case involved the subjects of bankruptcy; reclamation of property; consignment and sale; principal and agent; contract of agency and commissions.

By a contract, the claimant made bankrupt its exclusive agent for the sale of its goods within a certain territory, and agreed to keep him supplied with a stock which should remain claimant's property until sold to bona fide customers in the usual course of business. The contract did not fix, nor reserve the right to fix, prices at which the goods were to be sold, nor require bankrupt to account for the proceeds, but required him to report those on hand each month, and pay for goods sold, at a stated discount from list price, with provision for a credit of four months, if desired, up to a certain amount. Bankrupt was permitted to mingle the claimant's goods with his other stock, and the contract required claimant to furnish him

free of charge with advertising matter imprinted with his business name. The Court held, that while, as between the parties, the contract was one of consignment; as to creditors of the bankrupt, title to the goods passed to him, and they could not be reclaimed from his trustee.

A contract under which goods were furnished to an agent for sale was construed, and it was held that the commissions were based on the sum named in the price list, less 5 per cent discount for cash. [The Federal Reporter, Vol. 233, page 489.]

DANIEL V. ELECTRIC HOSE & RUBBER CO. This was a suit relating to a patent for a corrugated hose, the corrugations of which appear to have been of structural value, in that they strengthened the hose against lateral strain and increased its wear. After the expiration of the patent, in 1889, the plaintiff continued for some years to be the only manufacturer of hose displaying these corrugations. Upon this sole ground, the plaintiff claimed that it thereby acquired an exclusive right to manufacture hose in that form, the form having become distinctive of its goods. The court said that, if this were the law, it would follow that the patentee, after the expiration of his patent, had he been the only maker of this hose for some years following, could, by his own act, turn his patent, which the law limited to seventeen years, into a perpetual one, and rejected the plaintiff's application as an unwarranted extension of the monopoly previously enjoyed under the patent. [The Federal Reporter, Vol. 231, page 827.]

DE LASKI & THROPP CIRCULAR WOVEN TIRE CO. AND OTHERS V. UNITED STATES TIRE CO. The De Laski v. Thropp patent, No. 1,011,450, for a tire wrapping machine was held void for prior use by others. [The Federal Reporter, Vol. 232, page 884.]

TENSILE STRENGTH CALCULATOR.

A **CLEVER** device to assist in calculating the tensile strength of rubber has been recently designed and copyrighted by Philip E. Young, New Bedford, Massachusetts. The "Tensile Calculator," as it is called, is really a modified form of the slide rule, and, as shown in the accompanying illustration, is extremely simple both in construction and operation. It comprises a circular disk of white celluloid, on which is superposed one of lesser diameter and transparent, serving as a support for the annular transparent disk that revolves around it.

The inner superposed disk, being transparent, shows graduations from 15 to 150, representing the pull of the testing machine in pounds. The annular revolving disk shows graduations from

.035 to .350 that represent the thickness of the test piece in decimals of an inch. Coincident with the outer edge of the revolving disk and marked on the larger disk are graduations from 300 to 3,000, representing the tensile strength in pounds.

Knowing the thickness of the test piece and the pull of the testing machine in pounds, the reading for tensile strength is readily obtained by the following directions that are printed on the reverse of the calculator. These read: "Turn the transparent disk so that the thickness of the sample coincides with the pull obtained on the testing machine. On the outer scale, opposite the width of the sample, read the tensile strength."

The Philadelphia Rubber Works Co., Philadelphia, Pennsylv-

ania, has ordered a supply of these calculators which they will send gratis to the rubber consuming trade upon receipt of a written request.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered, nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[228.] A correspondent wishes to secure a second-hand tubing machine.

[229.] We are in receipt of two inquiries for rubber band cutting machines.

[230.] Names of manufacturers of dolls, balls and other toys made of rubber have been requested.

[231.] Names of vulcanizing accelerators and dealers in same have been requested.

[232.] A correspondent asks who manufactures a machine for making bundles of automobile casings, several tires to a bundle.

[233.] We have been asked where pure gum tape may be obtained and what concerns manufacture a machine to apply such tape on wire or similar substances.

[234.] Lists of manufacturers of electricians' gloves and of sponge rubber have been requested.

[235.] Manufacturers of laundry machinery such as washing machines, centrifugal driers, mangles, etc., are sought by a rubber manufacturer.

[236.] A rubber company wishes to know where flux may be obtained.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Cuba wishes to receive names and addresses of American manufacturers of machinery to be used in making automobile and bicycle tires and other rubber articles. Report No. 22,470.

A firm in Spain desires to import rubber packing. Report No. 22,471.

There is a market in Venezuela for all kinds of elastic products, such as suspenders, garters, belts, etc. Report No. 22,478.

A business man in Spain desires quotations on tennis balls. Report No. 22,523.

A New Zealand business man, now in the United States, wishes to be placed in touch with manufacturers of rubber, rubber dam and other dental supplies. Report No. 22,563.

An export house on the Pacific Coast has received orders from the Orient for elastic webbing. Report No. 22,642.

Representation of American manufacturers of machinery for rolling and working raw rubber, for laying prepared rubber around wires, and for stranding and braiding vulcanized rubber wires and cables is desired by a business man in Denmark. Report No. 22,663.

A commission agent in Holland desires to represent American manufacturers of rubber goods. Report No. 22,677.

A firm in Colombia is in the market for articles made of rubber. Report No. 22,681.

Inquiries have been received from Russia by an export house on the Pacific Coast, for rubber erasers. Report No. 22,721.

An inquirer in the Far East wishes to communicate with American manufacturers of elastic webbing. Report No. 22,730.

A firm in Greece wishes to import elastic for garters. Report No. 22,771.

The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., seeks bids on 500 feet of suction rubber hose.

New Goods and Specialties.

THE "DOVER" RAINCOAT.

FOLLOWING upon several years' experimentation in perfecting a black surface proofing for raincoats, the model here illustrated is being placed on the market. The special feature of this waterproof fabric is its light weight—a 52-inch length coat not exceeding $2\frac{1}{4}$ pounds. The cut of this garment shows its close conformity to present feminine style tendencies.

To complete the outfit, a hood of the same material, called the "Peggy" is also being manufactured. It is loose lined with silk, and is particularly well adapted for motoring, yachting or evening wear.

The new proofing is applicable to silk, fine cambric, and to wool or cotton cantons. [Canadian Consolidated Rubber Co., Limited, Montreal, Canada.]

ELECTRIC LAMP CHANGER WITH RUBBER FINGERS.

A device which greatly simplifies the operation of renewing burnt out bulbs in high theatre and hotel canopies and other inaccessible stationary sockets consists of three sleeves carrying a set of metal tongues which are bent to the shape of a bulb and covered with rubber protectors for nearly their entire length. The two end sleeves slide within the middle one. The lower sleeve is fixed on the end of a bamboo or steel pole by means of a spread cotter-pin. The lower ends of the tongues are joined to a disk held in the upper sleeve and joined to the fixed bottom sleeve by means of a coil spring, which acts as a universal joint.

The operation is simple. The pole is lifted so that the rubber-covered tongues slip over the bulb. These are adjustable to various sizes of bulbs. The rubber serves as a cushion, and also as a friction, so that by twisting the pole, the lamp is unscrewed from its socket. The new bulb is placed by a reverse operation. [McGill Manufacturing Co., Valparaiso, Indiana.]

"E. Z." GARTER WITH WIDE ELASTIC.

With many styles of garters a man takes his choice of two disagreeable sensations, due to the manner of adjustment—wrinkled socks, or a tightness about the leg which interferes with the circulation and is frequently the cause of foot trouble. In the "E. Z." garter, an exceptionally wide elastic is used, which is in itself an advantage as it does not bind the leg as would a narrow band. Everlastik, Inc., Boston, Massachusetts, is the maker of this elastic, which is specially woven with a view of softness and pliability, and shapes itself to the leg without adjustments. It is of featherweight consistency and permits ventilation. The garter clasp is attached to the elastic by a double strip of soft, smooth leather and no metal part touches the wearer's leg. This clasp fits over an anti-friction rubber-covered post or button, which holds the sock. It is claimed by the manufacturer that the regular size will fit 80 men out of 100, while a large size is furnished for men whose

legs measure more than 14 inches at the calf. [The Thos. P. Taylor Co., Bridgeport, Conn.]

SHAMPOO APRON.

The shampoo apron here illustrated is an exceptionally well appearing utility garment for protecting the clothing while washing the hair. It is made of fine rubberized fabric, shaped to cover the back and shoulders and leaving the arms free. The edges are neatly bound, and the apron fastens at the sides and neck by means of narrow ribbons run through metal eyelets, forming a trim and serviceable article. [Ernest Dudley Chase, Boston, Massachusetts.]

"PITCH EM," A RUBBER HORSESHOE GAME.

Throwing horseshoes over a stake set up in the back yard was a favorite pastime of our forefathers. The iron horseshoes, however, were heavy and cumbersome, suited only to the hand of an adult. In "Pitch Em," rubber horseshoes with a steel stiffening core make possible the indulgence of this popular and ancient sport within doors, the necessary peg being embedded in a metal disk. The game affords opportunity for the cultivation of skill and accuracy appealing to adults, and, as the horseshoes are light in weight and incapable of injuring the furniture if thrown wildly, it is also suitable and amusing for children. [Walbert Manufacturing Co., Chicago, Illinois.]

RUBBER DISKS IN CHILDREN'S SHOES.

Many shoes for children are made with stiff soles; and, further, many of these soles are so polished and slippery that they deter children from learning to walk. While rubber disks in shoe soles are not new, their application to children's shoes, to prevent the wearers from slipping, is a new application. The shoe shown here has three disks of rubber-coated canvas set in the heels and five similar disks in the forepart of the sole, these being the principal wearing points in walking. They wear down even with the level of the soles, but prevent slipping. [Little Chick Shoe Co., Chicago, Illinois.]

"RESISTOIL" AIR HOSE.

Ordinary hose, as used in garages, gets hard usage and little care. Because of this, and often from inherent weakness, it gives but comparatively short service. After years of unpleasant experience an air hose manufacturer claims to have discovered that the primary source of trouble lay in the inner tube. The oil that necessarily works its way into the hose eats through the inner tube. The air follows the perforation, working up and down the length of hose and leaking through the plies of cloth and rubber until it finds an outlet through the outside covering. Garage men then wind tape around the leaky place, while the air runs along under this patch until it finds another weak spot where it bursts out again.

Acting upon this knowledge, an oil-proof inner tube, the "Resistoil," shown in the accompanying illustration, was evolved. [Brunner Manufacturing Co., Utica., New York.]

AVON SPORTING BOOT STUDS.

For golfers, hockey players, and many outdoor workers, a shoe that firmly grips the turf is a prime necessity. The hob-nails frequently used for this purpose being heavy and cumbersome, are liable to blister the feet in summer and to make holes which cause wet, cold feet in winter. In the accompanying illustration a new design in rubber studs is shown, these studs being placed at regular intervals around the edge of the sole and heel. The manufacturer claims that by their use coolness in summer is obtained; also, dry warmth in winter, a thorough grip under all conditions, and exceptional wearing quality. Sets of large studs for men's, and small studs for women's boots are supplied in neat boxes, with nails for attaching them to the shoes. [The Avon India Rubber Co., Limited, Melksham, England.]

FLOOR SCRAPER WITH RUBBER TIRES.

Here is a floor scraper whose 5-inch wheels are equipped with rubber tires, thus avoiding all injury to the floor while in use. This No. 10 model is intended for scraping large surfaces. The adjustable cross handle may be placed to one side or the other, thus allowing the 6-inch double edge knife to be worked up to the wall and into the corners. The knife is firmly clamped in the scraper and nearly all the weight of the machine rests on the knife, preventing the vibration or "chatter" which causes wavy lines on the floor. The scraper is finished in aluminum; the length of handle and braces is 38½ inches, and the shipping weight, 135 pounds. [E. C. Stearns & Co., Syracuse, New York.]

TOY WITH RUBBER CORDS.

Toys whose pleasing absurdity, gay coloring and elastic power of motion would commend them to any child, are the duck-like figures of wood, colored in red, yellow, white and blue, in feminine or masculine guise, called the "Quacky Doodles" "Dandy Daddles" family. Their animated movements, which afford never-ending amusement for the little ones, are effected by the long jointed neck and strong rubber cord used in holding the head and neck together. The jointed neck is patented and operates on the ball and socket principle. The legs are also held to the body by elastic cords, permitting free movement. These toys were designed by Johnny Gruelle, a well-known artist. Their subtly humorous quality is appreciated by adults as well as children, and they are largely used as place cards. [P. F. Volland & Co., Chicago, Illinois.]

ANTI-JAR SOCKETS FOR UMBRELLAS.

On the theory that every silencer and shock absorber is a benefit, the no-jar principle is now applied to umbrellas. A socket of sheet metal is made to fit over the tip of the umbrella. This is covered with a piece of rubber tubing, and at the end

by a disk of rubber. When this protector is slipped over the tip or point of the umbrella it acts as does an elastic tip on a cane, absorbing the shock, preventing the slip, and quieting the noise. [Patterson Brothers, New York City.]

GAS TIGHT END FOR TUBING.

The use of rubber tubing for conveying gas from the household burner tip, or from special nozzles adapted for the purpose, is, to a greater or less extent, subject to leakage from imperfect connection. A rubber gas end is now manufactured which has an inside thread, or a series of annular ridges, which are sufficiently elastic to slip over the jet or nozzle, and to insure a gas-tight connection. The illustration shows the appearance of this useful accessory, while the sectional view gives details of its construction.

[Durst Manufacturing Co., Inc., New York City.]

RIBBED FORCE CUP.

The rubber force cup here shown is designed to secure with less material a cup as strong and efficient in all respects as the standard force cup. By means of longitudinal ribs in the side walls, the weight of the cup is lightened, while at the same time its suction power is increased, and it is claimed that the saving in weight is added to the quality of material. An increase in weight of the lower or working portion of the cup and a decrease in the upper portion holding the wood handle, adds still further to its effectiveness. The result is a light, strong, quick-acting cup, whose improved quality and utility is generally recognized by the plumbing trade. [Dryden Rubber Co., Chicago, Illinois.]

NON-SLIDE HAND HOLDS.

Many distressing accidents have been caused by the slipping of reins through the hands. But insurance against such contingencies has been provided by the rubber manufacturer in non-slipping hand holds. The cut herewith shows a set of such holds applied to the lines. They are composed of strong and durable serrated rubber in widths to suit every class of reins and prevent slipping in all kinds of weather. They are easy of ad-

justment and, besides their interest for riders and drivers generally, the fact that they make possible a perfect grip with one hand gives them a special value to those devoted to polo, steeple chasing and hunting. [C. W. Moseman & Bro., Walsall, England.]

AUTOMOBILE PEDAL PADS.

THE metallic control pedals of automobiles, however deeply grooved, corrugated or otherwise roughened, very rapidly wear smooth and slippery, because the necessity of providing a pedal that will not cause too great fatigue to the foot prevents the use of extra hard steel in these attachments.

These control pedals should always be ready for instant action. The slipping of the driver's foot from a pedal would mean momentary loss of control which might result in a serious acci-

PEDAL PADS FOR VARIOUS AUTOMOBILES—
MATTSON RUBBER CO.

dent, and automobilists long ago recognized the desirability of equipping their control pedals with some slip-proof device. Wood was tried and found of little value; some use insulating tape. But live, resilient, vulcanized rubber remains the only ideal, positive safeguard against foot slipping on automobile control pedals, and many different designs of rubber pedal pads have been placed upon the market.

The element of safety which these rubber pedal pads insure is not their only advantage. They relieve the muscle tension caused by constant pressure of the driver's feet, especially harmful in heavy city traffic; they save shoe leather from excessive wear; and they also act as insulators, protecting the driver's feet from the heat that constantly radiates from the motor to the control pedals and other metallic parts of the car.

The rubber pad, of course, must be detachable, in order that it may be really renewed. In some models, an adhesive lip attaches the pad underneath the pedal, but this method does not always prove satisfactory, especially with hard usage, and improvements are constantly being devised in the way of special

clamps and steel frames which join the rubber pad to the metal pedal so firmly that it cannot slip off nor shift in the slightest degree. A group of the various types of pedal pads manufac-

tured by the Mattson Rubber Co., Lodi, New Jersey, for different makes of cars, is shown herewith; also, the pedal pad of the

CORRUGATED FINGER PAD.

Fingertips of rubber are used by cashiers, bank tellers and others who are obliged to handle paper money, and by those who are required to count sheets of paper, or for similar manipulation.

A tip or pad with perforations to allow ventilation, and which also has ribs or corrugations forming a non-slip feature which facilitates lifting one and only one sheet or bill at a time, is called the "Marsh" hygienic finger pad, which is claimed to be the only patented device of its kind [Davol Rubber Co., Providence, Rhode Island.]

ADVANCE IN TENNIS SHOES.

As was reported in THE INDIA RUBBER WORLD last month, the United States Rubber Co. sent out a new price list of tennis footwear lines on September 1. This price list, as usual, was "subject to change without notice." This was certainly not a meaningless phrase, for the last of September the customers of the company were notified of an advance, amounting to from 3 to 5 cents per pair on Vim Bals and Oxfords. The changes were as follows:

	BALS.		OXFORDS.	
	Sept. 1	Sept. 26	Sept. 1	Sept. 26
Men's Vim.....	53 cents	57 cents	43 cents	47 cents
Boys' Vim.....	50 "	55 "	40 "	45 "
Women's Vim.....	49 "	53 "	39 "	39 "
Women's Vim.....	50 "	54 "	40 "	40 "
Men's Vim.....	48 "	52 "	38 "	42 "
Children's Vim.....	45 "	48 "	35 "	38 "

Prices are the same in individual cartons or in bulk; 24 pairs to the case.

No changes were indicated in the other tennis lines, or "Keds," as they are now designated.

The Year Book of the National Fire Protection Association is at hand. It gives the articles of association, the officers and committees, and a full list of associate members. The latter list contains about 3,000 names, of which perhaps 10 per cent are Canadian firms and individuals. Among these, the rubber trade is fairly well represented. In addition to this are a number of members in various countries of Europe, Australasia, Africa and Eastern Asia.

The exhibit of the Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana, at the recent Inter-State Fair held at Springbrook Park in South Bend, Indiana, was unanimously voted the best at the fair, as the company had a man at work all the time making boots.

STANDARD DEMOUNTABLE WHEEL SET FOR FORD CARS.

By means of a set of demountable wheel attachments and a spare wheel, the troublesome operation of changing tires when on the road is greatly simplified. A spare wheel is furnished to

carry a tire already inflated, and in case of a blow-out or puncture, all that needs to be done is to unscrew the four nuts shown in the illustration, change wheels and replace the nuts. The regular wheels already on the car may be used, the special parts furnished with this demountable wheel set rendering them all interchangeably demountable, one with the other. These special parts include four inner flanges, eight flange-retaining bolts and nuts and 16 special hub bolts and

nuts. One inner flange and two bolts are used to equip each wheel, while four special hub bolts and nuts should be mounted on each hub. The nuts are of fine hardened steel, rust proof and insensible to damage through severe use. The special bolts are manufactured from high carbon steel of great tensile and torsional strength and are claimed to have a capacity 300 per cent greater than that of ordinary carriage bolts. [The Standard Auto Accessory Co., Leipsic, Ohio.]

THE LEE PUNCTURE-PROOF GUARANTEED TIRE.

The users of Lee tires are provided with double assurance while motoring, one being a puncture-proof guarantee and the other a guarantee for 5,000 miles. The evils of puncture include roadside delays, discomfort and expense, all of which are usually collated in two fearsome words, "tire troubles."

Ordinary pneumatic tires are at the mercy of nails, glass and sharp stones that persistently find their way in the path of all motorists one day or the other. Chance only decides how soon the best car and the most careful

driver will meet with puncture disaster.

In the Lee tires, three separate layers of small puncture-proof disks are embedded in the rubber of the cushion that lies between the carcass and the breaker strip, forming a flexible armor of mail. It will be seen by referring to the illustration that while these disks overlap they do not touch each other, thereby avoiding the danger of friction and consequent heating. The carcass and tube are thereby protected and it is claimed that resiliency and wearing quality are increased by a special rubber compound and curing process. [Lee Tire & Rubber Co., Conshohocken, Pennsylvania.]

S. A. E. TIRE DIVISION RECOMMENDATIONS.

At the meeting of the Society of Automobile Engineers, held October 18 at the Bureau of Standards, Washington, D. C., the tire division recommended straight side tires from 32 by 3½ to 36 by 4½, as the larger straight sides are not practical. This recommendation was amended with a provision that straight sides be of the wide standard. The report was adopted.

THE BURRILL TIRE TOOL.

Split demountable rims require something more than ordinary tools to satisfactorily remove them from the tire. The utility of such a device consists, first of all, in compactness and simplicity of construction, then facility in applying it to the rim and an easy method of exerting in an even manner the force necessary to remove the rim.

As shown in the illustration, the two grips are hinged to the right and left-hand screw bolts that form part of what is known as an ordinary turnbuckle. The grips are slipped over the rim and with a few turns of the handle that is attached to the turnbuckle, the rim is sprung away from the tire without distortion, and easily removed. In applying the rim to a tire, the tool is attached in the manner previously described and the rim bent slightly downward, when it can then be sprung in place. [The Burrill Tire Tool Co., Concord Junction, Massachusetts.]

MOTOR FIRE ENGINE TIRES.

Tires for motor fire engines present some problems other than those common to motor truck or automobile tires. These engines have the weight and bulk of motor trucks, but require to

CROSS RIB TIRES FOR MOTOR ENGINES.

be driven at the speed of the motor car. The main problem is to prevent skidding, and two special tires which are pronounced peculiarly efficacious for this purpose are shown in the illustration. One of these shows parallel ribs diagonal to the rim. The other shows two sets of such ribs, at opposite angles, the tread being twice as broad. [The Shrewsbury & Calliner Tire Co., Limited, Ardwick Green, Manchester, England.]

THE UNITED STATES CIVIL SERVICE COMMISSION, WASHINGTON, D. C., announces an open competitive examination for expert electrical and mechanical aid to fill a vacancy in the Bureau of Yards and Docks, Navy Department, and vacancies which may occur in positions requiring similar qualifications. Applications must be filed with the Commission at the above address before November 14.

Rubber-Soled Footwear for Indoor Sports.

NOW is the season when devotees of athletics transfer most of their activities to the gymnasium, and, therefore, shoes adapted specially for such use are in demand. The manufacturers have not been backward in furnishing suitable footwear for this purpose, giving special attention to the re-

this sole has a wide edge, inside of which is a collection of square, convex sections, each having a vacuum cup in its center.

Another form of elaborate sole is shown by the Converse Rubber Shoe Co., Malden, Massachusetts, which contains, in-

BASKET BALL "KED"
UNITED STATES RUBBER CO.

BASKET BALL SHOE
LA CROSSE RUBBER MILLS CO.

"KING PIN" BASKET BALL SHOE
CONVERSE RUBBER SHOE CO.

quirements of the various uses to which it is to be put in the various games.

Just at present there is a greater demand for basket-ball shoes than any other line of this kind, though it is safe to assume that many shoes made expressly for this game are used in bowling, fencing, and other athletic sports. The principal requirements of basket-ball shoes are that they shall be strong

side of the broad edge, a depressed section composed of square spaces divided from each other by diagonal ridges and, in addition to these, the sections at the inside edge of the tread, both sole and heel, have further walls or longitudinal divisions.

Of the designs of the uppers of these shoes, the illustrations are sufficiently clear to require but little description. It will be noticed that they vary as regards the design at the toe, some

"CENTURY" BASKET BALL SHOE
APSLEY RUBBER CO.

BASKET BALL SHOE
APSLEY RUBBER CO.

"GRIP SURE" BASKET BALL SHOE
BEACON FALLS RUBBER SHOE CO.

and able to withstand the hard service to which they are subjected without ripping or tearing.

Another, and perhaps the principal requirement, however, is that they should have a non-slipping quality, that they should cling to the floor, which is usually highly polished, and on which ordinary footwear would render its use dangerous to the point of impossibility.

As a rule, manufacturers use the vacuum principle in the soles provided for this purpose, and several patterns are shown as used by different manufacturers. As is shown below, the Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, gets out a special basket-ball shoe, leather-trimmed, with a suction cup sole of red rubber. As will be readily noted,

showing leather caps, while others simply increase the width of the foxing, as shown in the shoe made by the La Crosse Rubber Mills Co., La Crosse, Wisconsin. Some of these shoes also have leather patches as extra protection to the ankle bones.

Attention might be called to the peculiarity of the sole of the shoe manufactured by the United States Rubber Co., New York City, the tread of the sole being beveled outward, the edge being cut at an angle, this of itself giving a clinging quality appreciated by basket-ball players.

These, of course, are only a few of the many lines manufactured for this or similar purposes, but it will serve to give readers an idea of the leading features of this special kind of footwear.

The Obituary Record.

AN AUTHORITY ON PLANTATION RUBBER.

CHARLES Arthur Lampard, whose death is chronicled in the English press, was one of the best known men in the rubber plantation industry of the Far East. Starting in business with a tea importing house in London, he later connected himself with the important firm of Harrisons & Crosfield, Limited, devoting

C. A. LAMPARD.

his attention to their foreign business. He made frequent visits to the various countries of Europe and to America, and in 1895 went to the Far East, establishing houses in Ceylon, India, the Federated Malay States, Sumatra and Java.

Early appreciating the importance of the plantation industry, he devoted his attention mainly to this branch. He became chairman of the Rubber Plantations Investment Trust, Limited, and at the time of his death was a director in no less than 29 of

the most successful rubber companies. It is stated that the association of his name with any new venture connected with the rubber plantation industry was a guarantee of soundness and that his unflinching optimism was a valuable asset to the industry during that period of doubt and difficulty which followed the collapse of the first wild boom. In his position as chairman of the Rubber Plantations Investment Trust, Limited, his addresses at the opening of the annual meetings were quoted far and wide, and many of his estimates and predictions as to the future of plantation rubber were subsequently verified with remarkable accuracy.

Mr. Lampard was not a believer in the practicability of the commercial production of synthetic rubber. He was one of the first to urge the advisability of forward rubber contracts and he foresaw the present situation of American consumers buying rubber in the East and shipping direct, thus eliminating the added expense of doing business through London.

Although still comparatively young, since the loss of a son in the present war Mr. Lampard's health had steadily declined, and in the early part of this year he relinquished his directorship of Harrisons & Crosfield and gradually curtailed his activities in other directions and practically retired to his estate in Home Park, Rotherfield, Sussex, where his death occurred as above stated. Mr. Lampard was one of the keenest and most far-sighted men of the rubber planting world in London, and by his death the trade loses one of its leaders and most striking personalities.

HANDLED TIRE FABRICS.

W. H. Tobey, Chicago manager, and director of J. H. Lane & Co., well known in the rubber trade, died in that city on October 3, after a long period of illness. He was about 44 years of age, and had been connected with J. H. Lane & Co. for the

last 23 years. He was held in high esteem by his business associates and by all with whom he came in contact.

WELL-KNOWN WASTE MATERIAL MAN.

M. Kaufman, head of the waste material house of that name in Chicago, Illinois, died in that city late in September, aged 77 years. Mr. Kaufman had been in the waste material business in Chicago since 1866, but during the past 10 years had not been active in the management of the business. He was highly esteemed by many in his own and other lines of business.

INVENTOR OF LIQUID INSULATION.

Henry Splitdorf, whose name is associated with Morse, Clark and Edison as inventor of important electrical devices, died in New York City on October 16, in the eighty-third year of

HENRY SPLITDORF.

his age. Mr. Splitdorf was born in Germany, came to this country at the age of 14 years, and was apprenticed to the machinist's trade. Later he entered the electrical business. Although he had but a common school education, by assiduous and concentrated study of electrical matters he became an expert and many of his inventions were of great importance in the fields of electricity and telegraphy. Of especial interest is the fact that he was associated with Samuel F. B. Morse in the development of telegraphic apparatus and in connection

with Clark he developed the Clark repeater, which made it possible for Thomas A. Edison to invent the multiple system of telegraphy, and at the time of his death Mr. Splitdorf had been working upon a storage battery which, however, had not been perfected. It was he who introduced asbestos as an insulating material and he was the inventor of liquid insulation of magnetic wire which has practically replaced the more expensive silk insulation used previously. It is through this invention very largely that present perfection in insulated wire has been attained.

Mr. Splitdorf was a constant attendant at St. Peter's Episcopal Church at Westchester, New York. Until old age overtook him he was a member of the Arion Club and the Liederkranz. He leaves two married daughters and two sons, one of whom, Charles Splitdorf, is vice-president of the Splitdorf Electrical Co., of Newark, New Jersey.

A POPULAR PURCHASING AGENT.

Nelson W. Sayles, purchasing agent of the Republic Rubber Co., Youngstown, Ohio, died in New York City October 14. He had been in declining health for a number of months. While

on a vacation he became critically ill, and six weeks later succumbed. Mr. Sayles was a graduate of Yale University. He entered the accounting department of the Republic Rubber Co. in 1910, and a year later was made purchasing agent. In business and in social circles he was universally esteemed, and by his kindness and genial spirit won many friends who deeply deplore his death.

A VETERAN IN RUBBER TIRE INDUSTRY.

George D. Edwards, manager of the Detroit (Michigan) branch of the Kelly-Springfield Tire Co., Akron, Ohio, died in Detroit, October 4. Mr. Edwards had been in the tire business over 20 years, dating back to his connection with the Rubber Tire & Wheel Co., the predecessor of the Kelly-Springfield company.

EXPERT IN TIRE MANUFACTURE.

Grover I. Myers, head of the pneumatic tire department of the Firestone Tire & Rubber Co., Akron, O., died as the result of an automobile accident last August.

CANADIAN CONSOLIDATED EMPLOYEES.

The executives of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, have instituted an employees' thrift plan to encourage money-saving among the employees of the company. This plan gives any employee the privilege of placing with the company any portion of his or her wages or salary which can be readily spared, for which the company will allow interest, to be added monthly. When the amount reaches \$100 or more it may, upon request, be used for investing in government bonds or other securities, the company giving every assistance in making this investment. It is thought that this will be of real practical benefit to the employees and that those who avail themselves of this privilege will be better employees for the company and thus render the benefit mutual. It will be interesting to see how many employees will avail themselves of this practical opportunity.

RUBBER SALESMAN IMPRISONED IN FRANCE.

News has been received from Paris, France, that William C. Silberman, of New York City, was sentenced by the Correctional Court to five years in prison and a fine of 500 francs, under a charge of trading with the enemy. It is claimed that Mr. Silberman came to Paris with papers describing him as a representative of the King Rubber Co., of Hyde Park, Boston, Massachusetts, and on the strength of these papers he obtained several important orders, but was finally denounced by a Serbian who had known him in New York, and who said that he was acting for Gottwik, Scheffer & Co., dealers in druggists' sundries in New York City. The senior member of the latter firm states that Mr. Silberman was never in its employ, and it was learned from Maurice D. Kingsbury, manager of the King Rubber Co., that Gottwik, Scheffer & Co. are the selling agents in New York City for the King Rubber Co., and that this firm recommended Silberman as a good man to represent the rubber company abroad and to handle sales of rubber gloves, etc., made by the King company, to the English and French military forces. Mr. Kingsbury is also reported to have said that, although Mr. Silberman went abroad some time last March he had made no report of sales nor had he drawn any money on account of the King Rubber Co. The case has been placed in the hands of the State Department at Washington.

The State of Missouri probably produces more barytes than any other in the Union. During 1915, barytes producers in this state marketed 40,000 tons. This substance is extensively used in rubber compounding.

ANNUAL REPORT OF THE INTERCONTINENTAL RUBBER CO.

AT THE annual meeting of the Intercontinental Rubber Co., Jersey City, New Jersey, held October 2, Secretary Willard P. Smith, in his annual report covering the year ending July 31, 1916, states that:

Conditions in Mexico have not improved the past year, and have been such that it has not been possible to operate the factory at all since the month of August, 1915. The prevailing prices for rubber have been low, but a reasonable profit has been realized from the sale of the stock remaining on hand at the time of shutdown.

Conditions on the Cedros Ranch likewise continued to be such that it has not been possible to round up the stock, nor to make any physical inventories. Gathering of guayule shrub, from which the rubber is extracted, has also been entirely stopped.

It has been possible to hold a meeting of the Directors of the Compania Ganadera y Textil de Cedros, S. A., which owns the ranch, and a small dividend from the prior earnings of that company was transferred to the income of the Intercontinental Rubber Company. The losses at the ranch from revolutionary disturbances, however, have seriously reduced the profits derived from former operations.

The balance sheet, which is reprinted below, shows net profits and income from investments amounting to nearly \$540,000, as compared with \$240,000 for the preceding year, and the surplus last July was nearly \$523,000 larger than the same time the year before.

BALANCE SHEET JULY 31, 1916.

At the annual meeting of the board of directors, the following officers were elected: G. H. Carnahan, chairman and president; E. B. Aldrich, vice-president; W. P. Smith, secretary and treasurer.

CONSOLIDATION RUMOR DENIED.

It having been rumored that The B. F. Goodrich Co., Akron, Ohio, had completed plans to take over the Boston Belting Co., President T. A. Forsyth of the latter company states that there is absolutely no foundation for such report; that the Boston Belting Co. has not been sold to any interests, and that there are no negotiations with any party having that end in view.

Rubber Men and Bankers Guests of Colonel Colt.

NEARLY 150 men prominent in financial circles were the guests of Colonel Samuel P. Colt, president of the United States Rubber Co., at his stock farm at Bristol, Rhode Island, on September 30. The invitations read: "To meet the president and directors of the Industrial Trust Co., of Providence, Rhode Island." The program, which was to some extent informal, included a lunch served in a large tent on the lawn opposite the casino, and inspection of the farm, during which there was an exhibition of the milking by an electrically operated device, of fine blooded cattle of pedigreed stock.

At 2 o'clock dinner was served in the casino, both the interior of the building and the spacious veranda being occupied. The interior was tastefully decorated with autumn foliage and with flowers from Colonel Colt's conservatories. A real Rhode Island clam-bake dinner was served which was fully appreciated by all the guests.

Colonel Colt, in opening the more formal exercises, proposed toasts to the President of the United States, R. Livingston Beekman, Governor of Rhode Island, and others. The principal speakers were Governor Beekman, Colonel H. Martin Brown, president of the Industrial Trust Co., of

Providence; Francis L. Hine, president of the First National Bank of New York City; Senator Le Baron B. Colt, William Cameron Forbes, former governor of the Philippine Islands; Colonel Samuel M. Nicholson, vice-president of the Industrial Trust Co., and Howard Elliott, president of the New York, New Haven and Hartford Railroad.

Naturally, most of the addresses treated of the present industrial prosperity of the country and the financial situation, which was well summed up by Senator Colt, who advised bankers to direct their energies to the power of production and the extension of our commerce, both foreign and domestic.

Besides the presidents and directors of many of the leading financial institutions of the country there were a number of guests who are prominent in the rubber trade. Among them were T. H. Rieder, vice-president and general manager, of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada; Roswell C. Colt, assistant secretary, and Victor E. Mitchell, of the same company; E. J. Hathorne, treasurer, Rubber Goods Manufacturing Co., New York City; E. H. Broadwell, vice-president, Fisk Rubber Co., Chicopee Falls, Massachusetts; An-

drew W. Anthony, of the National India Rubber Co., Bristol, Rhode Island, and the following officers of the United States Rubber Co.: J. Newton Gunn, vice-president; W. G. Parsons, treasurer; Samuel Norris, secretary; John D. Carberry, assistant secretary; William E. Barker, manager of sales; Walter S. Ballou, Wilson H. Blackwell, Frank W. Roche and others.

An orchestra furnished music during the repast, and the formal exercises were appropriately closed with a rendition of "The End of a Perfect Day."

PRESIDENT BOWERS TO RETIRE.

William F. Bowers, founder and president of the Bowers Rubber Co., San Francisco, California, a pioneer rubber manufacturing concern on the Pacific Slope, having sold his interests, will retire from business. Mr. Bowers has had a most interesting record. He went to California from Lynn, Massa-

chusetts, as a representative of the Gutta Percha & Rubber Manufacturing Co. in the late seventies. In 1882 he formed the Bowers Rubber Co., which was incorporated with a capital of \$300,000, to take over the San Francisco plant of the Gutta Percha & Rubber Manufacturing Co. and engage in making

MAIN ENTRANCE TO COLT FARM. MAGNIFICENT "PRIVATE PROPERTY," WHERE THE PUBLIC IS WELCOME

goods on an independent basis. This was the first company to manufacture rubber goods west of the Rockies on a large scale, and later was the pioneer manufacturer of fabric fire hose on the Coast. The company prospered from the start, and later acquired a plant of about 12 acres in the city of San Francisco. The works built there withstood the shock of the earthquake in 1906, only to be totally destroyed by the fire which followed. A new and more extensive plant was built at Black Diamond, California, and was steadily enlarged as the business grew. For many years this company furnished all the fire hose used in the City of San Francisco, did business all along the Coast and filled several contracts for dredge sleeves and suction hose for the Panama Canal Commission. The company now manufactures a full line of mechanicals and has recently taken on the production of tires and tire tubes.

Mr. Bowers has taken out many patents for hose, hose reels, packing, etc.

He was very highly regarded by all connected with him in business and popular with his employees. So prominent a figure in the Pacific Coast rubber trade will not drop out of it without much regret on the part of all with whom he came in contact.

News of the American Rubber Trade.

SOMERSET RUBBER RECLAIMING WORKS IMPROVEMENTS.

THE Somerset Rubber Reclaiming Works, of New Brunswick, New Jersey, have been making many changes in their factory at East Millstone, adding a number of labor saving devices and machinery to cut down the cost of manufacture, and doubling the producing capacity. A sprinkler system has been installed, the company having joined the Factory Mutual Fire Insurance Cos. For the comfort and convenience of the workmen, shower baths have been installed. The laboratory has been enlarged and equipped with the latest modern apparatus, and a staff of chemists is employed to keep check on the material as it passes through the factory, to assure uniformity of the product. This laboratory is placed at the disposal of the company's customers, expert service being furnished; all such matters of course being treated absolutely confidentially. A specialty of the company is white reclaimed rubber, for which a very large demand is noted. The plant has been working day and night to full capacity.

REINCORPORATES WITH ENLARGED CAPITAL.

The Pennsylvania Rubber Co., Inc., notice of whose incorporation appeared in the September issue of THE INDIA RUBBER WORLD, has been organized with an authorized capital of \$6,000,000, of which \$1,000,000 is 7 per cent cumulative preferred stock and \$5,000,000 is common stock, for the purpose of providing the additional financial requirements necessary to properly handle and care for the increased volume of business of the Pennsylvania Rubber Co. It is asserted that from a volume of trade of less than \$1,000,000 in 1909, the business of the company has developed so that this year it will pass the \$5,000,000 mark. The directors of the new incorporation are as follows: Herbert DuPuy, H. Wilfred DuPuy, C. M. DuPuy, Seneca G. Lewis, George W. Shiveley and George A. McLaughlin.

CAPITAL INCREASE OF FISK RUBBER CO.

At a special meeting of the stockholders of The Fisk Rubber Co., Chicopee Falls, Massachusetts, October 2, mentioned last month, it was voted to authorize an increase in the capital stock of the corporation by \$24,500,000, divided as follows: \$7,500,000 first preferred convertible stock, of which \$5,000,000 will be issued at once; \$5,000,000 second preferred, of which \$2,500,000 will be issued, and \$12,000,000 common stock which will remain in the treasury. The additional issue of second preferred is being taken by the junior security holders, being offered to them on a basis of one share for every four shares of common and second preferred owned in the aggregate. The first preferred has been underwritten by a syndicate headed by Estabrook & Co., Boston, Massachusetts. The new cash is to be used for working capital.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on October 25, are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	63	65
Firestone Tire & Rubber Co., common.....	1135	1150
Firestone Tire & Rubber Co., preferred.....	110	112
The B. F. Goodrich Co., common.....	73 3/4	74
The B. F. Goodrich Co., preferred.....	113	114 3/8
Goodyear Tire & Rubber Co., common.....	295 1/2	298
Goodyear Tire & Rubber Co., preferred.....	108 1/4	109
Kelly-Springfield Tire Co., common.....	77 1/2	78
Kelly-Springfield Tire Co., 1st preferred.....	98	100
Miller Rubber Co., common.....	250	260
Miller Rubber Co., preferred.....	105	107

Portage Rubber Co., preferred.....	173	174
United States Rubber Co., common.....	60	60 1/2
Swinchart Tire & Rubber Co.....	86	92
United States Rubber Co., preferred.....	110	111

METALWOOD MANUFACTURING CO.

Improvements under way for the Metalwood Manufacturing Co., Detroit, Michigan, involve the rebuilding of the central portion of the company's plant, which will give approximately 6,000 square feet of floor space. A 10-ton traveling crane will also be installed, to facilitate handling the work. These improvements are necessitated by the rapid growth of the business, and we are advised that among recent orders of the Metalwood company were repeat orders from the Goodyear Tire & Rubber Co., Akron, Ohio, for Metalwood duplex vulcanizing presses and from Gutta Percha & Rubber, Limited, Toronto, Canada, for Metalwood quick operating remote control type valves.

RUBBER COMPANY DIVIDENDS.

The American Tire Fabric Co. paid a regular quarterly dividend of 1 3/4 per cent on preferred stock on October 2 to stockholders of record September 20.

The Globe Rubber Tire Manufacturing Co. has declared the regular semi-annual dividend of 3 1/2 per cent on the preferred shares, payable November 1, to stockholders of record Oct. 27.

The B. F. Goodrich Co. has declared a dividend of \$1.75 per share on preferred stock, payable January 2, 1917, to stockholders of record December 21, 1916, and a quarterly dividend of \$1 per share on common stock, payable February 15, 1917, to stockholders of record February 2.

The Goodyear Tire & Rubber Co. paid the usual quarterly dividend of 1 3/4 per cent, on October 1 to stockholders of record September 20.

The Hood Rubber Co. paid a bi-monthly dividend of \$1 on common stock on October 14.

The Keystone Tire & Rubber Co. paid a quarterly dividend of 2 per cent and 1/4 per cent additional on its preferred stock and a quarterly dividend of 2 per cent on the common stock, with 3/4 per cent additional, on October 2, to stockholders of record September 8.

A quarterly dividend of 2 per cent was paid by the Miller Rubber Co. on October 20 to stockholders of record October 1.

The New Jersey Zinc Co. has declared a quarterly dividend of 4 per cent, and an extra dividend of 5 per cent, both payable November 10, to stockholders of record October 31.

The Pennsylvania Rubber Co. has declared dividends of 1 3/4 per cent on the preferred stock and 1 1/2 per cent on common stock, payable January 1, 1917.

The Ten Broeck Tyre Co., Louisville, Kentucky, has declared a 4 per cent dividend. This marks the resumption by the company of the payment of dividends which had been interrupted by the outbreak of the war and unsettled business conditions.

The United States Rubber Co. paid a quarterly dividend of 2 per cent on first preferred stock and a quarterly dividend of 1 1/2 per cent on second preferred stock on October 31 to stockholders of record October 14.

The Westinghouse Electric & Manufacturing Co. paid the regular quarterly dividend of 1 3/4 per cent on preferred stock on October 16 and 1 1/2 per cent on common stock October 31, both dividends payable to stockholders of record October 6.

The directors of the Lee Tire & Rubber Corporation have declared a quarterly dividend of 50 cents per share and an extra dividend of 25 cents per share, payable December 1 to stockholders of record November 15.

TRADE NOTES.

The Manhattan Rubber Manufacturing Co., Passaic, New Jersey, has increased its capitalization from \$1,000,000 to \$2,000,000.

The Reading Rubber Manufacturing Co., Reading, Massachusetts, has recently installed a well at its plant which was put down 303 feet, approximately 250 feet of which was through solid rock. The diameter of the well is 8 inches, and it gives a yield of about 70 gallons without lowering the level from the surface greater than 14 feet. A second well is being built by the company, from which equally good results are expected.

F. Bierman & Sons Metal & Rubber Co., St. Louis, Missouri, has a new building ready for occupancy, equipped with facilities which will enable this firm to handle all shipments with more promptness than heretofore. The building is of brick construction, two stories high, 65 by 100 feet in dimensions.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has sent out a notice that it will redeem at the rate of \$1,050 and accrued and unpaid interest for each bond of \$1,000 face value, all of its convertible sinking fund 5 per cent gold bonds of 1915 issued under the trust indenture dated July 28, 1915, and outstanding on January 1, 1917.

When enlargements now in progress at the Kimmel felt factory at Kitchener (formerly Berlin), Ontario, are completed, all the manufacturing of the Canadian Consolidated Felt Co., Limited, will be done in the Kimmel factory, and the old Berlin felt factory will be used entirely for warehouse purposes.

Additions to present buildings of the Rotch Mills department of the Passaic Cotton Mills at New Bedford, Massachusetts, are almost completed and a new spinning and weaving building is also in course of erection. Taylor, Armitage & Co., Inc., 120 Broadway, New York City, are the selling agents.

The Advance Felt Specialty & Cutting Co., Chicago, Illinois, has recently accomplished its second move within the last 18 months, the changes being due to the rapid growth of the business. In the new quarters at 318-322 South Jefferson street, the company occupies a two-story building of brick construction with full concrete basement, equipped throughout with specially designed machinery for the cutting, stripping and punching of rubber, felt cloth, and analogous materials.

The Armstrong Rubber Co., Inc., Newark, New Jersey, has a plant 75 by 98 feet which has recently installed equipment for the manufacture of regular and molded automobile inner tubes and rubber specialties for the trade, including two 150-horsepower boilers, one 200-horsepower electric generator and an Ingersoll Rand compressor. The calendars and mills are each driven by a separate motor drive, and the plant has an up-to-date Grinnell sprinkler system.

Gutta Percha & Rubber, Limited, Toronto, Canada, has recently purchased the property on which its offices and warehouse are situated in Saskatoon.

The Bibb Manufacturing Co., Macon, Georgia, has increased its capital stock from \$1,500,000 to \$2,500,000 out of accumulated surplus, on account of extensive enlargements at the Columbus factory of the company.

It is proposed to erect 20 dwellings to house the employees of the National Rubber Co., Pottstown, Pennsylvania, and to that end J. C. Feist, of the company, recently purchased a 60-acre tract on the outskirts of that city, the property being a part of the estate of the late Joshua B. Lessig.

The Belmont Packing & Rubber Co. will shortly erect a plant at Butler and Janney streets, Philadelphia, Pennsylvania. The offices of the company are located at 139 North Second street in that city.

The Republic Rubber Co., Youngstown, Ohio, has offered 10,475 shares of its common stock pro rata, at par, to its com-

mon stockholders. The proceeds, about \$1,000,000, will be used for working capital and extensions.

The Milwaukee Engineers' Club, consisting of members of the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and the American Chemical Society held its first meeting of the season in the new engineering building of the Federal Rubber Co., Cudahy, Wisconsin. A paper on "The Growing and Gathering of Rubber Latex" was read by L. J. D. Healy, chief chemist of that company, and the members, numbering 183, were taken through the factory where the process of manufacture was followed from beginning to end, after which luncheon was served.

PERSONAL MENTION.

Collier W. Baird, treasurer of the Rubber Trading Co., 9-15 Murray street, New York City, and a member of Troop A, First Squadron Cavalry, N. J. N. G., returned last month after a four months' tour of duty at Douglas, Arizona.

Edward Bers, of the firm of E. Bers & Co., Philadelphia, Pennsylvania, dealers in scrap rubber and metals, has been sojourning at French Lick Springs, Indiana, for a brief vacation.

P. W. Day has been appointed sales manager of the F. S. Carr Rubber Co., of Canada, Limited, Granby, Quebec.

Frederick J. Hall, formerly second vice-president of the Habirshaw Wire & Cable Co., that was merged with the Electric Cable Co., is now manager of the cable engineering department of the new company, the Habirshaw Electric Cable Co., Inc., with headquarters at 10 East Forty-third street, New York City.

Michael Minns, for some years identified with the sales department of the B & R Rubber Co., has recently been appointed sales manager of the Quabaug Rubber Co., North Brookfield, Massachusetts, which purchased the business of the former mentioned company.

William L. Wadleigh, head of Wadleigh Co., Limited, Singapore, after a sojourn of five months in the United States, will sail from San Francisco, California, November 11, on the "Tenyo Maru." He expects to arrive in Singapore, December 21.

WINDOW PUBLICITY OF THE UNITED STATES RUBBER CO.

The windows of the United States Rubber Co., in New York City, are in charge of a truly ingenious and artistic window dresser. The many products of this company seem to be displayed without partiality. A whole window is given to a single line or article, and the goods are surrounded by appropriate accessories and backgrounds. Lay figures, life size, are used, where they can be, to advantage. Tires for automobiles, motorcycles and bicycles have been shown. Belting, life preservers, outing shoes, boots and shoes, and bathroom accessories, are among those recently shown. The Brazilian forest has been represented, also a model of the plantation of the United States Rubber Co. in Sumatra.

A BIG USER OF RUBBER TIRES.

The Fifth Avenue Coach Co., which operates 132 motor-buses in New York City, has just published its annual report for 1915-1916.

A feature brought out in this report is that the 132 buses ran at a cost of only 21 cents per bus mile, each bus using six tires, the rear wheels each having two tires. This cost per mile is based on a mileage of 4,966,690.36 miles. New tires purchased by the company during the fiscal year covered by the report cost \$54,533.63.

A CORRECTION.

In the October number of THE INDIA RUBBER WORLD appeared a statement by its Trenton correspondent regarding the Post Tire & Rubber Co., that on further investigation proves erroneous. THE INDIA RUBBER WORLD is very glad to take this occasion to contradict it.

KELLY SPRINGFIELD COMPANY TO MOVE.

It is practically settled that the Kelly-Springfield Tire Co., now at Akron, Ohio, will occupy a new factory to be built specially for it at Cumberland, Maryland, with the probability that eventually the entire manufacture will be centered there. It is understood that building operations will be begun at once.

NEW INCORPORATIONS.

Alliance Tire & Rubber Co., Inc., September 19 (Delaware), \$2,500,000. William F. O'Keefe, George G. Steigler, E. E. Wright—all of Wilmington, Delaware. Principal office, 901 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires, tubes and accessories.

The Alliance Tire & Rubber Co., Inc., October 9 (Ohio), \$2,500,000. Milton Bejach (president and general manager); John C. Shively (vice-president); Walter H. Christensen (secretary and superintendent); John B. Pow (treasurer), and Frederick W. Throssell. Principal office, Alliance, Ohio. To manufacture automobile tires and rubber goods.

Apex Tire & Rubber Corporation, September 28 (Delaware), \$100,000. Levi Helms, Walter J. Pollock, and Joseph A. McCarthy, 1092 East Third street, Brooklyn, N. Y. Principal office, Corporation Trust Co. of America, 394 duPont Building, Wilmington, Delaware. To manufacture rubber tires and inner tubes for automobiles and other vehicles.

Automobile Salon, Inc., The, September 28 (New York), \$25,000. Hjalmar A. Holm, 672 Park Place; August Engel, 592 Vanderbilt avenue—both in Brooklyn, N. Y., and George Alonzi, 1464 First avenue, New York City. Automobiles and accessories.

Chicle Gum Co., September 6 (Delaware), \$300,000. John H. McBride, 243 W. 76th street, and Hugh Francis Doris, 214 W. 70th street—both in New York City, and John Wynne, 501 Court street, Brooklyn, N. Y. Principal office with M. McLaughlin, 827 Spruce street, Wilmington, Delaware. To manufacture and deal in rubber and vegetable products, chemical compounds, etc.

Colonial Tire & Rubber Co., Inc., September 25 (New York), \$25,000. J. B. Crockett and Amos White, 44 Whitehall street, and Ira W. Henry, 149 Broadway—both in New York City. To manufacture and deal in tires.

Dayton Tire Sales Co., Inc., September 28 (New York), \$10,000. Elbert R. Detamble and John A. Pontolillo, 1764 Broadway, and Bailey C. Elliott, 1400 Broadway—both in New York City. To deal in rubber tires, etc.

Fero's Broadway Store, Inc., September 27 (New York), \$10,000. James J. Fero and William A. Miller, 792 Seventh avenue, and Alfred Hines, 1074 Lexington avenue—both in New York City. To manufacture and deal in automobile tires, accessories, etc.

Goodrich Auto Service Corporation, F. W., September 22 (New York), \$75,000. Frank W. Goodrich, 312 East 58th street; Peter V. Hoyt, 745 St. Nicholas avenue, and Henry W. Showers, 15 Wall street—all in New York City. To deal in tires, auto supplies, etc.

Hygrade Rubber Co., Inc., October 16 (New York), \$10,000. J. F. Kraeutler, Jr., 66 Beaver street, New York City; H. L. Goldbaum, 461 Edgecombe avenue, Bronx, N. Y., and George Kuhlmann, 925 St. Marks avenue, Brooklyn, N. Y. To manufacture rubber goods.

Keystone Rubber & Tire Co., Inc., August 12 (Delaware), \$500,000. M. R. Haymaker, Wilkinsburg; S. W. Crosby, 20th avenue, Homestead, and R. S. Robb, Aspinwall—all in Pennsylvania. Principal office, Keystone Building, Pittsburgh, Pennsylvania. To manufacture tires, etc.

Merit Raincoat Co., Inc., October 20 (New York), \$1,200. Morris Duglin, 828 Longwood avenue; Kassiel Spinner, 700

Cauldwell avenue—both in Bronx, and Louis Kimmel, 499 Riverdale avenue, Brooklyn—both in New York. To manufacture rubber apparel, etc.

National Cover Co., Inc., October 7 (New York), \$1,200. Isaac Raffelson, 1471 Vyse avenue, Bronx, N. Y.; Samuel Greenberg, 400 West 160th street, and Abraham Kruckman, 166 West 141st street—both in New York City. To manufacture slip covers for tires, seats, etc.

National Insulate Co., Inc., October 16 (New York), \$50,000. Peter Meyer, 105 West 120th street, and Simon S. Hamburger, 320 Broadway—both in New York City, and Isaac S. Beck, 767 Tinton avenue, Bronx, N. Y. To manufacture insulating material, etc.

Orville Rubber Co., September 26 (Delaware), \$150,000. Morgan Howells, Bucyrus; E. B. Cornell and E. A. Homeier, Cleveland—both in Ohio. Principal office, Capital Trust Co. of Delaware, Dover, Delaware. To manufacture automobile tires, inner tubes, etc.

Osler Racine Rubber Co., September 22 (California), \$100,000. J. S. Bennett, Hebermain Building, Los Angeles, California. Principal place of business, Los Angeles, California. To manufacture rubber goods, tires, and to do a general rubber business.

Panther Rubber Co., Limited, September 15 (Canada), \$100,000. Charles A. Joslin and others of Sherbrooke, Quebec, Canada. Principal office, Sherbrooke, Quebec, Canada. To manufacture rubber heels, soling, patching and molded goods. It is also the intention of the corporation to purchase the Canadian business of the Panther Rubber Manufacturing Co., Stoughton, Mass.

Perfection Tire & Rubber Co., September 23 (Delaware), \$15,000,000. C. R. Cole, 6029 Indiana avenue; Charles W. Harris, 732 Marquette Building—both in Chicago, and K. S. Wilson, Oak Park—all in Illinois. Principal office with Reynolds Clough, Esq., Dover, Delaware. To manufacture and deal in automobiles, tires, accessories and specialties.

Rubber Tire Sales Co., Inc., September 7 (New York), \$20,000. Walter Ulrich, John F. Forrester, William O'D. Langley—all of 346 Broadway, New York City.

Southwestern Rubber Co., September 15 (Missouri), \$5,000. H. A. Young and G. F. Knight, Kansas City, Missouri; Ransom Stephens, C. D. Darrigrand, and Fred P. Darrigrand, Wichita, Kansas, and, D. P. Richardson, Union, Oklahoma. Principal office, Kansas City, Missouri. To do general tire repair business, to operate a tire repair school, to manufacture inner tubes, auto tire sundries, and Ford size tires in wrapped tread type.

Standard Tire Valve Co., September 13 (Massachusetts), \$100,000. Michael F. Clarke and John F. Luther, 40 Central street, and John W. McCormack, Tremont Building—both in Boston, Massachusetts. Principal office, Boston, Massachusetts. To manufacture and deal in tire valves, motor vehicles, and engines and machinery in connection therewith.

Thing & Co., G. E., Inc., October 16 (New York), \$25,000. George H. Mayo, and Henry B. Hubbard, 1790 Broadway, New York City, and J. F. Barnes, 37 Pearl street, Buffalo, N. Y. Principal office, Buffalo, N. Y. To deal in leather and rubber goods.

Tire Co. of Philadelphia, Inc., October 5 (New York), \$6,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, N. Y. To manufacture rubber tires.

Universal Tire & Rubber Co., September 8 (Delaware), \$1,000,000. John Chamberlin, George Davis, 51 Market street, Poughkeepsie, and Egbert B. Cresswell, 119 Eddy street, Ithaca—both in New York. Principal office, Corporation Trust Company of Delaware, Dover, Delaware. To manufacture and deal in rubber goods of every description, automobiles, etc.

TRADE NOTES.

At the annual election of the McGraw Tire & Rubber Co., held at the company's offices, East Palestine, Ohio, the following officers were elected: E. C. McGraw, president; R. W. McGraw, vice-president; John Morgan, secretary, and L. M. Kyes, treasurer. The shares of the common stock were increased from 20,000 to 40,000, changing the par value from \$100 to \$50 per share. The capital stock of the company was increased from \$3,000,000 to \$4,000,000 equally divided between common and preferred. A daily output of 5,000 tires is in early prospect.

The F. E. Partridge Rubber Co. has recently transferred its factories from Montreal, Quebec, to Guelph, Ontario, Canada, enlarged facilities being thus provided for the manufacture of the company's numerous lines of rubber goods, as well as special advantages for handling an increasing trade in druggists' sundries, automobile tubes and tire accessories. To its established range of trade-mark goods, the company has now added the manufacture of automobile tires.

The Firestone Tire & Rubber Co., Akron, Ohio, has purchased a lot at the corner of Broad and Kinney streets, Newark, New Jersey, and will build thereon a three-story structure 50 x 170 feet, to be used as a tire service station.

As soon as a satisfactory site is secured, the Sioux City Tire Manufacturing Co. will commence the erection of its plant, which will probably take the form of a three-story structure, 150 by 50 feet.

The Lapeer Commercial Club, of Lapeer, Michigan, is negotiating for the establishment of a tire manufacturing enterprise in that city, which is prepared to subscribe \$25,000 toward a site and building.

P. H. Boalen, formerly manager of the automobile supply department of the Bailey Co., has recently been appointed head of the sales department of the Mason Tire & Rubber Co., 1806 Euclid avenue, Cleveland, Ohio. The factories of the company are at Kent, Ohio.

The Atlantic Tire & Rubber Co., Wilmington, Delaware, will change its name to Boone Tire & Rubber Co.

The \$250,000 plant of the J. & D. Tire & Rubber Co., at Charlotte, North Carolina, is now nearing completion. The estimated output will be 350 tires a day. H. O. Smith is president of the company.

The Ackerman Wheel Co., founded by A. H. Ackerman, has organized a \$2,500,000 corporation for the manufacture of the Ackerman wheel, a new device for the correction of tire troubles. The new wheel is equipped with spring steel spokes and solid tires. It is stated that negotiations for a \$250,000 plant, at Cleveland, Ohio, have recently been closed.

It is stated that the capacity of the Morgan & Wright factory of the United States Tire Co., at Detroit, Michigan, where the Royal Cord tires are made, will be doubled by or before the incoming of 1917.

The Mutual Tire & Rubber Co., whose incorporation was noted in the October issue of THE INDIA RUBBER WORLD, is a coöperative organization, which offers its stockholders tires, which are the product of the company at a discount from list prices. The officers of the company are William McKay, president; C. E. Barker, vice-president and treasurer, and John Hall Jones, secretary. The executive officers are at 30 East Forty-second street, New York City.

The plant of the Lion Tire & Rubber Co., at LaFayette, Indiana, is approaching completion, and is expected to be in working order and producing tires and tubes before the first of the year. The building is of brick, two stories and basement, 100 by 180 feet. Calenders, washers and machinery have been installed for the production of 200 tires and tubes a day. The

plant is excellently located, is 5 acres in extent, adjoining the Belt railroad, thus furnishing advantageous shipping facilities. The board of directors includes several of the leading business and financial men of LaFayette, Decatur and Peru, Indiana, and Chicago, Illinois.

Plans for the proposed Westgard Tire & Rubber Co., to be erected at Warren, Ohio, are being prepared by a well-known concern of Cleveland, Ohio, architects. The main building will consist of two stories and basement, 100 by 240 feet, of fireproof construction. The power plant will be a separate one-story building, 40 feet square.

PERSONAL MENTION.

The title of Joseph C. Weston, of the United States Tire Co., New York City, has been changed from general sales manager to director of sales, and O. S. Tweedy has been appointed general branch sales manager, instead of assistant general sales manager.

H. H. Grobe, formerly manager of the truck tire department of the Kelly-Springfield Tire Co. in New York City and territory, has been given charge of the Baltimore, Maryland, branch, beginning November 1. Mr. Grobe has been with the company for five years.

F. J. Loewe will be general manager of the new tire plant of the Brunswick-Balke-Collender Co. at Muskegon, Michigan.

John J. Kearns, a vice-president of the Fisk Rubber Co. and head of the research department, and two of his assistants, W. W. Whiting and John C. Cole, have resigned their positions with that company.

Horace W. Hakes, a well-known Michigan tire man, has taken the agency of the Republic Rubber Co., for western Michigan. Mr. Hakes is prominent in masonic and political circles.

Erwin Oberheu has been appointed manager of the Columbus, New Mexico, depot of The B. F. Goodrich Co.

Walter T. Sewell, sales manager of the Sewell Cushion Wheel Co., is making a trip through the East and will meet the branch selling organizations of the company in Pittsburgh, Baltimore, Philadelphia, New York and Boston, to discuss plans for the coming year.

F. W. Sherwood has been made assistant manager of the New York City branch of the Kelly-Springfield Tire Co. Mr. Sherwood is well known in the tire business, having previously been New York manager of the Gibney Tire & Rubber Co. He was also one of the early salesmen of the Diamond Rubber Co. and, later, truck tire manager for the Firestone Tire & Rubber Co.

CHANGES IN UNITED MOTORS CORPORATION.

William M. Sweet, for ten years general manager of the Motor and Accessory Manufacturers, the national organization of the accessory industry, of which tires form an important part, has become assistant to the president of the United Motors Corporation, New York City. This recently incorporated firm is a holding company with Delco, Hyatt, New Departure, Remy, Klaxon and Perlman as its subsidiaries. Mr. Sweet has assumed the management of the new corporation as the representative of the president and board of directors, and will doubtless find his previous experience of great value to him in the present development work along similar lines. While the board of directors felt compelled to accept Mr. Sweet's resignation as president, they elected him a member of the board to succeed Mr. Lovell, and he will serve until 1919. He was also elected chairman of the 1917 banquet committee.

L. M. Bradley, advertising manager of the "American Motorist," official publication of the American Automobile Association, has been elected general manager of The Motor and Accessory Manufacturers' Association, succeeding Mr. Sweet.

TRADE NOTES.

The Lee Tire & Rubber Co., Conshohocken, Pennsylvania, has recently erected a two-story addition, 80 by 120 feet, in which the dipped goods department is to be installed, the removal of this department from the tire building enabling an increase in tire production to about 2,000 tires per day. The new building is of the same construction as the main buildings, steel and concrete, so arranged that additional stories may be built at any time.

The capital stock of the Be Saw Tire & Rubber Co., Hartville, Ohio, has been increased from \$150,000 to \$220,000. The new issue is all preferred stock and the company contemplates using this new capital for additional buildings and equipment which will allow for an increase in the daily output of from 100 to 250 tires.

The Toledo-Findlay Tire & Rubber Co., Findlay, Ohio, has elected new directors for the ensuing year, as follows: C. I. Moffitt, L. W. Eckhardt, F. E. McMannus, H. O. Fellers, Charles Reick, A. O. Hamilton and V. T. Spiller, all local men. The company expects to manufacture automobile casings exclusively in the future.

The Kelly-Springfield Tire Co. of Indiana recently demonstrated the anatomy of its tires from the crude materials to the finished product, in a striking exhibit occupying six windows in the Merchants' Heat & Light Co.'s building in Indianapolis.

The Gillette Safety Tire Co., Eau Claire, Wisconsin, reports that its first factory unit, size 250 by 60 feet, is now completed, and a 50 by 80-foot office and laboratory building is in process of construction. It is expected that the installation of machinery will be completed in time to begin operations in December. Additional buildings will be constructed in the spring of 1917.

The Keystone Tire & Rubber Co., New York City, has increased its capital stock from \$500,000 to \$1,500,000.

The managers of the various tire branches in Cleveland, Ohio, met recently at a "get together" luncheon, inaugurated by C. A. Dunham, manager of the Cleveland branch of The B. F. Goodrich Co., and the affair was such a success that others of the kind will be given. Besides Mr. Dunham, those present were: L. L. MacAnaney, of the Republic Rubber Co.; Charles E. Ball, Portage Rubber Co.; J. H. Bolden, Mason Tire & Rubber Co.; W. H. Barcus, Fisk Rubber Co.; J. D. Hess, Jr., Firestone Tire & Rubber Co.; F. E. Workman, Kelly-Springfield Tire Co.; C. T. Black, Goodyear Tire & Rubber Co.; B. E. Aaronson, Hood Tire Co., and John W. Lawrence, of the Republic Rubber Co. of Cleveland.

Morgan Howells is said to be promoting a rubber company to be known as the Cornell Howells Rubber Co., to be located at Orrville, Ohio.

The American Spring Tire Co., located at 30 West Lake street, Chicago, Illinois, is placing the De Voll spring cushion tire on the market. This tire is a series of Swedish steel springs made to fit inside any outer casing now in use, with the cushioning inside the outer cover, eliminating the disadvantages of the double center. The spring cushions do not come in contact with the casings, but are suspended on four roller bearings, the function of which is to permit the tire to take the side thrust, as allowed by the air tube. It is claimed that in this tire, friction, blow-outs, puncture and other ailments to which tires are subject are eliminated—a delightful if optimistic pretension. The tires are sold under a guarantee and it is estimated that a set of them will last the life of any car.

The stockholders of the Marion Tire & Rubber Co., Marion, Ohio, recently held their first annual meeting at which 125 stockholders were present. The treasurer's report indicated that the company was in good financial condition and prospects

for continued success seemed excellent. The following members were re-elected to the board of directors: W. H. Heverstott, C. W. Fairbanks, J. W. Jacoby, D. H. Lincoln, J. L. Price, C. W. Mapes, A. H. Trout and W. T. Jones. H. L. Gilbert was also elected a director. The factory manager is Grant Lambright.

PERLMAN PATENT CONTESTED.

Details of the important Perlman demountable rim suit were given in THE INDIA RUBBER WORLD of May 1, 1916. That the question of the priority and legality of the Perlman patents may not yet be fully and finally established is indicated by the fact that two suits have been entered against the Perlman Rim Corporation, the later one being that brought by Louis De F. Munger, whose patent is dated December 5, 1899, and, therefore, has but a little over one month longer to run. The other suit is that of Erle K. Baker, of the Universal Rim Co., who is suing for infringement of several patents which involve the mounting of the rim upon a conical seat and the application of lateral pressure.

MID-CONTINENT TIRE COMPANY BUILDS.

The Mid-Continent Tire Manufacturing Co. has begun the erection of a \$160,000 factory at Wichita, Kansas, which will have a capacity of 300 casings and 500 inner tubes a day. The main building will be 300 by 60 feet, two stories high, and there will be two other buildings besides the main one, a power plant and vulcanizing plant, all constructed of reinforced concrete, and fireproof. More than \$50,000 worth of machinery has already been purchased.

At a recent directors' meeting, Henry Lassen, president of the Kansas Milling Co., was elected president of the Mid-Continent company. Ransom Stephens is vice-president and secretary; Charles Darrigrand, treasurer pro tem, and general manager.

RACINE RUBBER CO. ELECTIONS.

Stuart Webster has been elected president of the Racine Rubber Co., Racine, Wisconsin, succeeding H. L. McClaren, resigned. Mr. Webster, who has been with the company since it was organized in 1910, was formerly treasurer and later vice-president, in which office he is succeeded by Louis T. Vance. H. C. Severance remains as secretary and treasurer.

NEW CORPORATION TO TAKE OVER POLACK COMPANY'S BUSINESS.

The Polack Truck Tyre Corporation has been organized under the laws of New York State, with a capitalization of 100,000 shares with no par value, to acquire the assets and business of the Polack Tyre & Rubber Co., Bridgeport, Connecticut. Forty thousand shares will be offered for sale, the proceeds of which will be used for erection and equipment of a new plant to handle steadily increasing business.

The Polack Tyre & Rubber Co. was incorporated in 1912 and acquired the manufacturing rights, formulae, secret processes, patents, etc., of the European Polack Co., and is now operating 26 active branches in the largest cities of the United States and Canada. Hugo Hoffstaedter, president of this company, will become president of the new corporation, which will also retain the manufacturing and sales organization of the present company.

NEW PENNSYLVANIA TIRE COMPANY.

The Keystone Rubber & Tire Co., Inc., Pittsburgh, Pennsylvania, notice of whose incorporation appears elsewhere in this issue, owns a steel and brick factory, valued at \$125,000, and three acres of ground at Penn, Pennsylvania, on the main line of the Pennsylvania Railroad. An option on 12 adjoining acres allows for future expansion. The plant is being fully equipped and production of the "Keystone" tire will be begun within a short time. The company will employ 600 people, working in three 8-hour shifts.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE annual sales convention of the Firestone Tire & Rubber Co., held during the past month, was the biggest and most successful in the history of the company, about 500 salesmen and agents, from all parts of the United States, and from Canada, England, Australia, Cuba, South America and Europe, gathering at the Akron factory. There were important business sessions, including a close study of Firestone methods and factory work, and addresses were made by H. S. Firestone, president; R. J. Firestone, general sales manager; A. G. Partridge, assistant sales manager, and others. The Firestone clubhouse was lined with exhibitions by the factory departments, and the factory buildings and all rooms in which meetings were held were decorated with the colors of the company, red and black. Banquets, luncheons and sight-seeing trips, including visits to the larger industries of the city, were also enjoyed.

Action on the proposed increase of capital to \$50,000,000, and declaration of a 700 or 800 per cent dividend, of the Firestone company has been delayed until November 2, owing to the fact that stockholders cannot vote legally on an increase in capitalization until after November 1, the last day of the period set for retiring the present preferred stock. It is reported that the proposed new stock issue will be offered to the public through the Cleveland Trust Co., Cleveland, Ohio. The transaction is unique in Akron rubber company financing, as it is the first large issue carrying as low a dividend rate as 6 per cent.

The Firestone company has purchased 150 acres adjacent to the factory for a new power house and additional factory buildings. For every addition wood models are made from blue prints, and exhaustively inspected by officers of the company before actual building commences.

A recently acquired 500-acre tract, to be called "Firestone Park," is laid out with park spaces and reserved tracts for churches and schools, while unusually large home lots are being sold to the employees at 10 per cent down.

At the recent dedication of the Firestone clubhouse, restaurant and gymnasium, H. S. Firestone and Mayor Laub were the chief speakers.

Machinists in the employ of the Firestone company have been granted an eight-hour day and a slight increase in wages over the ten-hour day.

* * *

Actual shipments of products of The B. F. Goodrich Co. for the eight months to September 1 amounted to approximately \$50,000,000, a gain of 40 per cent over the same period of last year, and it is predicted that a total over-turn of \$77,000,000 may be reached this year.

Completion of the fifty-eighth building in the Goodrich factory group will bring the total floor space occupied by this plant up to 4,024,329 square feet, or 92.3 acres. The latest building will have six stories and basement, and will be of brick and concrete construction, almost identical with two other recently completed buildings. It will be 360 feet long, 100 feet deep and 101 feet high above the street level, with 252,000 feet of floor space and a window area of 42,315 square feet. A bridge will connect each floor of this new building with one of the others.

C. R. Serfass, formerly manager of the Columbus, New Mexico, branch of the Goodrich company, has been transferred to Akron.

* * *

The General Tire & Rubber Co. has increased its capital stock from \$200,000 common stock to \$500,000 total capital, divided into preferred stock to the amount of \$200,000 and common stock to the amount of \$300,000. The company now has on order for delivery in the spring, additional equipment which

will double the capacity of the present plant. This equipment will be installed in two additions now being erected, one 60 by 60 feet, three stories in height, and the other a one-story building of saw-tooth construction, 60 by 250 feet in dimensions.

At a special meeting of directors of the General Tire & Rubber Co. held on September 16, the directorate was increased to seven members by the election of G. F. Burkhardt, of Akron, and J. A. Diebolt, of Cleveland. Charles Herberich, vice-president and treasurer of the Depositors Savings & Trust Co. in this city, was elected treasurer. Other officers of the company are: M. O'Neil, president; William O'Neil, vice-president and general manager, and W. E. Fouse, secretary.

* * *

The Star Rubber Co. has been reorganized, with a capital stock of \$400,000, of which \$200,000 is preferred and \$200,000 common. This company has been manufacturing druggists' sundries and automobile tires and tubes in a small way for some years, and with the reorganization, the sundry line will be discontinued, and the output of tires and tubes greatly increased. It is expected that the company's new tire will be on the market about December 1. The new officers are as follows: L. H. Firey, president and treasurer; R. N. Robinson, vice-president; J. B. Huber, secretary, and Fred Gostlin, factory manager.

* * *

Net sales of the Swinehart Tire & Rubber Co. during its last fiscal year, totaled \$1,680,000, according to the annual report presented to the directors on September 28. The company is now making 500 tires a day, and is showing an increase of 20 per cent in business. The following were elected directors: B. A. Polsky, Fred Snyder, W. M. Weldon, Charles Currie, T. E. Barry, Dr. E. L. Mather, T. F. Walsh, F. S. Long and R. E. May. Officers were reelected.

* * *

The Mohawk Rubber Co. is adding a new floor approximately 80 by 150 feet, to an old building, and a three-story annex to one of the recently completed buildings comprising its plant. The total cost of these additions will be about \$60,000, and new machinery, including boilers, calenders, mills, etc., sufficient to increase the present capacity about 50 per cent will bring the expenditure in the neighborhood of \$125,000.

W. J. Smith, of the Mohawk's Akron staff, has been placed in charge of a new Kansas City branch opened by the company last month.

* * *

The capital stock of the Akron Rubber Mold & Machine Co. has been increased from \$60,000 to \$300,000, owing to the rapid growth of its business. Extensions to the company's plant are under consideration.

* * *

V. C. Blandin, Akron representative of Pell & Dumont, crude rubber dealers, 68 Broad street, New York City, will occupy new offices in the Ohio building after November 1.

* * *

An interesting and instructive feature of the annual sales conference of the Goodyear Tire & Rubber Co. held early last month, was an elaborate exhibit tracing the tires and other products of the company from the tropical jungles to the finished product.

In order to secure its own water supply for the power plant and immense battery of vulcanizers, the Goodyear company has purchased a lake, 100 acres of land, and has secured easements of land around another lake.

W. E. Finney, formerly manager of the Goodyear branch at St. Louis, Missouri, has been assigned to the mechanical goods department at the home factory.

* * *

The appointment of Clyde S. Thompson as advertising direc-

tor of the Miller Rubber Co. is the first step in an extensive advertising campaign about to be launched by the company.

* * *

A novel method of advertising mileage records is being carried out by the Amazon Tire & Rubber Co., a Haynes racing car traversing the streets of this city equipped with the company's tires and bearing signs reading "Testing Amazon Anti-blowout Tires. Mileage to date ———." A blank space is left for the figures, and each day the mileage is chalked on the sign.

* * *

The Kelly-Springfield Tire Co. is erecting a 50 by 50-foot, two-story addition to its plant at Wooster.

* * *

The Rubber Products Co., of Barberton, has increased its capital stock from \$300,000 to \$500,000, to care for increased business in "Stronghold" tires and in the druggists' sundries line.

* * *

The Marathon Tire & Rubber Co., at Cuyahoga Falls, has increased its capital stock from \$500,000 to \$1,000,000. This company is progressing fast, the business for its fiscal year ending August 31, showing an approximate increase of 70 per cent over the year previous.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

BOSTON rubber manufacturers, and by that is meant that large list of manufacturers who market their goods here, or whose factories are situated in eastern Massachusetts, are, without exception, busy. There is no branch of the trade which is languishing because of lack of demand. On the contrary, many manufacturers have all the orders they can fill, and some have more—much more—goods ordered than it will be possible for them to make and ship before the season for their use has passed.

* * *

The present situation in the rubber footwear trade was explained to the members of the New England Shoe Wholesalers' Association at a luncheon given in this city October 11, by George Hutchinson, of the W. H. McElwain Co. He stated that to-day's conditions are not due to any scarcity of crude rubber, nor to any lack of adequate capital or plant facilities on the part of rubber companies. The principal trouble, he attributed to labor scarcity, although this, of course, applies to practically all industries. In Connecticut, for example, rubber factory workmen who formerly received from \$2 to \$2.25 a day, are now getting \$3.50 to \$4, and it is found also that parents whose daughters have been working in rubber factories in order to help out the family income, are not willing, in these prosperous times, that they should work as many hours a week as formerly. As illustrating the inability of some of the rubber companies to meet current demands, Mr. Hutchinson stated that recently one of these concerns had been obliged to refuse an attractive order for rubber tires, amounting to \$300,000, because it could not guarantee deliveries.

"Some of our manufacturers," said Mr. Hutchinson, "are finding it about as bad to have too much business as to have too little."

* * *

According to the balance sheet of the Boston Woven Hose & Rubber Co., dated September 1, the volume of net business for the year was \$6,101,462. The surplus and guarantee is \$1,220,116, as compared with \$1,684,411 on September 1, 1915. During the year under consideration, the capital stock was increased from \$2,000,000 to \$2,750,000 by a stock dividend representing a transfer from surplus earnings of \$750,000.

New buildings and machinery valued at \$322,710 have been added to the plant and charged to earnings for the past year.

The assessed value of the land is \$160,900, while value of buildings is \$1,761,219, a total of \$1,922,119 from which there is deducted the sum of \$533,046 as a reserve for depreciation, leav-

ing \$1,389,072, which is the net figure carried in the balance sheet. The same policy is followed with respect to the item of machinery and tools amounting to \$1,664,282, from which \$879,176 is deducted as a reserve for depreciation.

* * *

In a neat frame in the office of Vice-President Greene, of the American Rubber Co., at the Essex street office in this city, is a motto or sentiment reading: "The man who has the right to

N. L. GREENE.

criticize also has the privilege to commend." This is signed with the initials "N. L. G." Those who attended the banquet given to the salesmen by the United States Rubber Co. last December will remember the slogan of that occasion: "Are We Downhearted?" "No!" "How Is Every Little Thing?" "Fine!"

The author of the slogan, the man who put the questions and received the thunderous answers, was N. Lincoln Greene, whose whole business life, with the exception of a few months, has been spent in the rubber trade. He was born in Boston in 1871 and educated in the public schools of that city. He attended the Boston Latin School preparatory to entering Harvard University, but on account of illness relinquished that plan and in August, 1889, became errand boy for Joseph W. Woods, a cotton broker. This lasted but a short time, when he entered the employ of Houghton, Coolidge & Co., Boston, who were then agents for the Para Rubber Shoe Co. He remained with that firm until the death of A. L. Coolidge, its president, when he resigned his position to go with the Boston Rubber Co., which then manufactured clothing at Chelsea and footwear at Franklin, Massachusetts. When this company was bought out by the United States Rubber Co. in 1892, the latter company continued to manufacture the brands of clothing formerly made by the Boston Rubber Co., having them made at the American Rubber Co.'s factory in Cambridge, Massachusetts. This factory was under the management of S. Lewis Gillette. Mr. Greene became his right-hand man, and in 1911 succeeded him as manager of the clothing department of the American Rubber Co. Under Mr. Gillette's management there were but three clothing salesmen. Since that time the number of salesmen handling that specialty has increased to ten, with a 300 per cent increase in the business.

In January, 1916, the American Rubber Co. and the Stoughton Rubber Co. consolidated. Mr. Greene was made vice-president of both companies and manager of the clothing department. In his present position he not only attends to the manufacturing, buying and selling of the American and Stoughton brands, but also to the clothing manufactured at the Goodyear India Rubber Glove Manufacturing Co., at Naugatuck, Connecticut, the carriage cloth made at the Boston Rubber Shoe Co.'s factory at Malden, Massachusetts, and the topping manufactured at Goodyear's Metallic Rubber Shoe Co., at Naugatuck.

Prior to assuming his present position, Mr. Greene had a wide experience as a salesman, having sold clothing in every State in the Union, in Canada and Mexico, and also traveling in Europe as special representative of the United States Rubber Co. His only business trips now are to the meetings of the clothing salesmen in Chicago, Illinois, and New York City in August and February of each year. He is a member of several clubs, is fond of out-door sports, is an enthusiastic golfer, and has a host of friends and a wide-spread business and social acquaintance.

* * *

The more automobiles, the more tires. Therefore the traffic census of the Massachusetts State Highway Commission is of interest to the tire trade. In the last six years, this report says,

horse-drawn traffic has decreased 5 per cent per year, while motor vehicle traffic has increased 70 per cent per year. This is the result of a systematic count, taken at 238 points, 14 hours per day, for seven days. In 1912 the proportion was 63 per cent motor vehicles and 37 per cent horse-drawn. The 1915 census of traffic showed 82½ per cent motors and 17½ per cent horse vehicles. During the six-year period the total traffic increased 145 per cent, but motor vehicles increased 420 per cent and horse vehicles decreased 30 per cent. There were practically no motor trucks in 1909, but the increase from 1912 to 1915 was 230 per cent.

These are accurate figures. They apply to 1915. Any one at all familiar with the trade knows that 1916 should show an even greater proportionate increase over the previous year. It would not seem far out of the way to estimate an increase of 100 per cent this year over last, and a proportionate augmentation of the tire business. * * *

The Standard Woven Fabric Co., manufacturer of "Multi-bestos" products, and rubber specialties, which recently acquired the plant of the Walpole Rubber Co., at Walpole, has sold its plant at Framingham to the Bela Body Co., manufacturer of automobile bodies, which will remove there from Amesbury, Massachusetts. * * *

The Latons Manufacturing Co., of Worcester, manufacturer of suspenders and other elastic webbed goods, has moved to larger quarters, having leased some 6,100 square feet of floor space in the new addition of the New England Corset Co.'s building, on Green street, in that city. This change will more than double the capacity of the first-mentioned company. * * *

The plant formerly occupied by the Bemis Rubber Co., near Bemis station, in Watertown, has been sold to the Sawyer Products Co. of East Cambridge. The premises consist of 2½ acres of land, and factory buildings with an aggregate floor space of about 17,000 square feet. There is also a railroad siding connecting with the Boston and Maine railroad. The new owners will make extensive improvements and will operate the factory in the manufacture of an entirely new product. * * *

Merton A. Turner, sales manager of the Monatiquot Rubber Works Co., South Braintree, Massachusetts, and Miss Olive H. Grant were married at the residence of the bride, in Braintree, on October 11. The marriage was a quiet one, only immediate relatives of the bride and groom being present. The honeymoon was spent on an automobile trip. Mr. Turner has a host of friends in the trade who are sending congratulations. * * *

Charles W. Barnes, of the New York City office of the United States Rubber Co., was in Boston a week ago on a sad errand. He was a resident here previous to his transfer to the head office, and his aged mother made her home in Cambridge. Last month the old lady, ninety years of age, visited friends in New Glasgow, Nova Scotia, and on the 19th, died in a house but a short distance from the one in which she was born. Mr. Barnes brought the body to this city for burial. * * *

Frederick C. Hood, of the Hood Rubber Co., opened the attractive grounds of his estate, in Brookline, the 7th of last month, for the exhibition of puppies by the Airedale Terrier Club of New England. Mr. Hood's estate was an ideal place for the show, the residence situated at the top of a hill, and the judging ring was one of the terraces leading to the garden. Mr. Hood was awarded a prize for his "Boxwood Bingley Bountiful." * * *

Ira A. Burnham, vice-president of the American Rubber Co., is nursing a broken collar bone, the result of an automobile accident. Mrs. Burnham had three ribs fractured at the same time.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

TIRE manufacturers here are much interested in the Egan good roads bill, which is to be voted upon by the people of New Jersey at the November election. The bill provides for the appropriation of several millions of dollars to be expended in building good roads from one end of the State to the other. One of the results of the law's enactment, it is believed, would be a big boost to the auto and, consequently, to the tire business. * * *

An electrical show will be held in Masonic Temple, December 6, at which time there will be a display of insulated wire and hard rubber goods used in connection with electrical devices. * * *

William R. Thropp & Sons, Co., the well-known rubber machinery house, has found it necessary, owing to the increase of its business, to purchase additional real estate, adjoining its plant, on East State street. * * *

John M. Miller, for 17 years with the Empire Rubber Tire Co., of this city, has been appointed manager of the Cleveland, Ohio, plant of the Polson Rubber Co. He will enter upon his new duties the first part of November. * * *

Dale O. Pohlman, sales manager of the Thermoid Rubber Co., returned about the middle of last month from a trip during which he visited the St. Louis, Indianapolis, Chicago and Detroit branches of the company. * * *

J. M. Dawson has been placed under arrest here on the charge of passing bogus checks, some of which he is said to have used to defraud people in the rubber trade. According to the police, Dawson obtained a facsimile of the checks used by the Crescent Insulated Wire & Cable Co. Several checks, alleged to have been passed by Dawson, were received, in due course by the First National Bank of Trenton and were declared to be forgeries. * * *

The John A. Roebling Sons Co., of this city, has leased a five-story and basement warehouse at 223-227 Arch street, Philadelphia, Pennsylvania. The building, it is said, will be used for making wire goods and for storage purposes.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

WHILE the several rubber factories throughout the State continue to report an unprecedented business activity, the increasing scarcity of desirable help is causing considerable worry. Goods of every description are being shipped in large quantities daily, and to all parts of the world. Rubber shoes of all kinds are being distributed to every section of this country and to many foreign ports. Tennis shoe orders are large. * * *

Some time ago the employes of the Revere Rubber Co., Olneyville, with the assistance of the officials, formed a "safety first" committee, and great strides are being made in the company's plant in the work of protecting the employes. In a large rubber manufacturing establishment such the Revere company's, accidents are more or less numerous, because of the number of grinding and other large machines. The "safety first" body has been going through the plant in a systematic manner, covering up the dangerous parts of the machinery, and educating the employes to be more careful at their daily toil and to take better care of themselves. As a result of this work, the number of accidents has been reduced, until the hospital of the plant, a modern improvement recently established, is amply able to attend to all the cases.

The committee, having in mind the health and physical well-being of the employees, has organized a "keep clean" sub-committee whose duty it will be to see that all of the working, wash and toilet rooms are kept as clean as possible. This committee is already doing much good among the employees, and it is predicted that this will be one of the model plants of the entire United States Rubber Co.'s system of factories within the coming year.

* * *

The new brick addition to the vulcanizing department of the National India Rubber Co.'s plant at Bristol, is very nearly completed and will be ready for use before the end of the year. The new vulcanizers are now being placed in position in the addition.

John W. Church, for many years connected with the business affairs of the National India Rubber Co., and more recently head of the traffic department, has accepted a position with Peckham Bros., automobile and supplies dealers, Providence. He is succeeded by W. L. Dudley, of Woonsocket, who has had several years' experience in the business.

Chester R. Colwell, who for several years has been in charge of the carpentering department at the National factory, has resigned to accept a position in Providence. William C. McLaughlin, for several years draughtsman and pattern maker in the department, has been appointed to fill the vacancy.

* * *

The filing of a corporation return at the office of the city clerk of Pawtucket shows that the paid-in capital of the Phillips Insulated Wire Co. has been increased to \$2,500,000, the full amount allowed by the charter amended at the January session of the General Assembly of the present year. The return is signed by the following: Henry F. Bassett, president; Herbert O. Phillips, treasurer; Edgar B. Phillips, secretary; Henry F. Bassett, Herbert O. Phillips and Charles F. Price, directors.

* * *

A third dividend of 16 $\frac{2}{3}$ per cent has been ordered paid to the creditors of the Consumers' Rubber Co., of Bristol, by the referee in bankruptcy, Nathan W. Littlefield. This makes a total of 56 $\frac{2}{3}$ per cent that has been allowed so far, the last dividend now being payable by the trustee, Robert S. Emerson, of this city.

* * *

The Bourn Rubber Co., Westfield street, Providence, reports an especially busy year so far, and at present is being driven to capacity in nearly all departments. This is particularly true of the insulated wire department, and during the past month several additions have been made to the working force of that section.

* * *

The Narragansett Rubber Co., of Bristol, is adding to its plant. A new two-story wooden building, 88 feet in length and 50 feet in width, is practically completed, the lower floor of which is to be used as a calendering room.

* * *

Albert Lodlum, who has held a prominent position with the Revere Rubber Co. for several years, has resigned. Before leaving, his associates presented to him a gold watch chain and fountain pen.

* * *

During the past month the assessors of taxes in the various towns and cities throughout the State have been filing their annual assessment lists. Among the larger taxpayers are the following who are identified with the rubber industry, in addition to those previously reported: At Cranston—Atlantic Tubing Co., \$22,415; William B. Banigan Estate, \$34,160; Emma T. O'Connor, executor of William B. Banigan's will, \$97,600.

At Pawtucket—Collyer Insulated Wire Co., \$67,420; Everlastik, Inc., \$187,020; Hope Webbing Co., \$828,860; Phillips Insulated Wire Co., \$664,980; Tubular Woven Fabric Co., \$34,180.

* * *

The International Rubber Co., which is being operated several hours each evening, in addition to a full-time day schedule, turning out carriage cloth at West Barrington, experienced a shortage of white cloth which necessitated a shutdown for a couple of days.

* * *

Henry L. Scott & Co., formerly of 223 Eddy street, Providence, have removed their offices and factory to their new building, Blackstone and Culver streets. The new factory has been equipped with the latest machinery and appliances and a cordial invitation is extended to the trade to visit the plant and inspect late models. This company specializes in the manufacture of machines for the testing of rubber and fabrics used in the production of rubber merchandise.

* * *

While overhauling the Millville plant of the Woonsocket Rubber Co. recently, the workmen found the cylinder head on the engine so badly cracked as to preclude any possibility of using without repairs. It was necessary to shut down the plant for several days while the work was being done.

* * *

James Leach, for over 21 years employed by the Mechanical Multiple Fabric Co., the last 19 years as foreman of the spreading department, has resigned to accept a similar position with the Firestone Tire & Rubber Co., of Akron, Ohio. His local associates presented to him a gold watch chain and charm and a substantial leather suitcase. Superintendent Lloyd, of the Fabric company making the presentation speech.

RUBBER CLUB BANQUET ANNOUNCEMENTS.

INTEREST in the coming banquet of The Rubber Club of America, Inc., to be held in New York City January 8, will be heightened by the announcement that two of the speakers on that occasion will be Hon. William H. Taft, Ex-President of the United States, and F. A. Vanderlip, president of the National City Bank of New York, both of whom will speak on important national matters of direct interest to the rubber trade. Committees are being appointed to promote interest in this meeting. The following have already been chosen, and are at work in their various sections:

CANADIAN COMMITTEE. Charles N. Candee (chairman), Gutta Percha & Rubber, Limited, Toronto; T. H. Rieder, Canadian Consolidated Rubber Co., Limited, Montreal; J. Westren, Dunlop Tire & Rubber Co., Toronto.

BOSTON COMMITTEE. Hon. L. D. Apsley, Apsley Rubber Co., Hudson; Frederick H. Jones, Tyer Rubber Co., Andover; Harold P. Fuller, E. H. Clapp Rubber Co.

AKRON COMMITTEE. H. S. Firestone, Firestone Tire & Rubber Co., chairman.

TRENTON COMMITTEE. J. A. Lambert, Acme Rubber Manufacturing Co., chairman.

A NEW RUBBER ASSOCIATION.

Efforts are being made in London to form a new rubber association which would devote special attention to British interests in the rubber industry in Java and Sumatra, which are very extensive.

It is said that the Rubber Growers' Association was approached with a view to the formation of a separate branch under its auspices, but as such arrangement could not be made, it is proposed to proceed independently. In fact, in certain respects the problems plantation companies have to deal with in the Dutch East Indies are quite different from those of the Malay and Indian companies.

The India Rubber Trade in Great Britain.

By a Special Correspondent.

FROM information received from different sections of the country it appears that the volume of general trade continues to be good, but pneumatic tire manufacturers report a slack business. There is a constant turnover, but it is stated that the restrictions on the use of petrol, or gasoline, as you call it, have, in fact, seriously affected the tire trade. A great number of automobiles are laid up in garages; even commercial cars in some cases have been idle for months, largely owing to the prohibitive price of gasoline.

RUBBER HELPS SOLVE GASOLINE SHORTAGE.

Many owners of commercial automobiles are now using city gas instead of gasoline as a fuel for their motors.

The use of gas as a fuel for automobile gasoline engines is not new, for town gas has long been used by manufacturers for the preliminary testing of their engines, though it will not give the power of gasoline.

The problem was to conveniently carry this city gas on vehicles. At first it was attempted to store it in metal tanks, under

MOTOR BUS WITH RUBBER-LINED GAS CONTAINER.

pressure, but these were found far too heavy for practical use on motor trucks and, after many tests and experiments, the accepted container now is a double texture canvas bag with rubber insertion, rendering it water and gas tight. This is roped or strapped to the roof of the vehicle and is filled from the gas supply mains. Far from increasing the weight of the vehicle, this rubber-lined gas-bag rather has a tendency to lighten the load on the springs.

SOLID TIRE BUSINESS GOOD.

While business is slack and competition very keen in the pneumatic tire trade, the solid tire industry is working night and day and there is unlimited faith here in this branch of the rubber industry.

MECHANICAL RUBBER GOODS.

Manufacturers of mechanical rubber goods are doing very brisk business and there is no sign of slackness in this line in the near future.

Rubber toy and novelty manufacturers also report excellent orders.

The demand for rubber soles and heels is increasing every day and large manufacturers in this line are well employed. Some small ones, however, are said to be experiencing a trying time, due to the fact that the withdrawal of labor from small works is usually more seriously felt than similar withdrawal from large factories.

RECLAIMING INDUSTRY.

Rubber reclaimers continue to suffer from the labor difficulties mentioned in a former communication, but they are nevertheless doing a roaring business and have trouble in promptly meeting orders.

WATERPROOF GARMENTS, ETC.

The waterproof garment people are working full time and overtime. They have received large government orders for garments for the soldiers, who are sure to pass another winter in the trenches, and the wet weather we have been experiencing has made a great demand for waterproof garments, both rubberized and chemically treated.

Cable and insulated wire manufacturers have all the work they can handle.

Demands for all kinds of surgical rubber and other hospital appliances are increasing daily.

TIRE MANUFACTURERS' ASSOCIATION.

The British Rubber Tyre Manufacturers' Association, Limited, is the name of an organization recently formed "to watch over, protect and advance" the interests of British tire manufacturers.

To qualify for membership, a tire manufacturer must have his principal works in the United Kingdom and his tire sales must be to the extent of at least 90 per cent manufactured in Great Britain. Companies whose capital is to the extent of 25 per cent or more held, directly or indirectly, by individuals resident outside the limits of the British Empire, will be barred from membership.

Dealers in rubber tires may become members of this association provided the sale of tires is their principal business though, even then, their admission to membership is discretionary with the general committee of the association. Rubber manufacturers whose works are situated in any British colony, dependency, or self-governed dominion are also eligible for membership at the discretion of the general committee.

RUBBER MACHINERY NEEDED IN CHINA.

From a recent report of our Board of Trade, it appears that machinery will be required in the near future for the rubber plantations in the island of Hainan, China.

The Board of Trade tells us that there is an American merchant at Kiung-chau, Hainan, China, and under existing conditions it is probable that an American manufacturer will get the business.

RUBBER EXPORTS TO HOLLAND.

The Foreign Office has issued notification that no additional export licenses or other facilities will be given for the export from England of rubber and balata to Holland or Sweden until further notice.

CHANGES IN EMBARGO LIST.

The Royal Proclamation of May 10, giving a list of prohibited exports, has been amended. The heading, "Goods wholly or partly of rubber, gutta percha or balata," has been deleted from the list of prohibition to all destinations, but has been added to the list of prohibition of exportation to all non-British destinations.

NEW RUBBER IMPORTING COMPANY.

Ernest Gray & Co., Limited, was registered recently with a capital of £1,000, in £1 shares, to carry on a general import business in dentists' supplies, including dental rubbers and other articles composed of rubber, porcelain or similar substances. This new company's address is Cul-de-Sac Road, East Molesey, England.

THE SITUATION IN FRANCE.

By our Regular Correspondent.

SINCE my last communication I have had the opportunity of visiting Clermont-Ferrand, the center of our rubber industry, the Akron of France. I had not been there since the outbreak of the war and I assure you that the changes brought about by the present conditions are much more visible there than here in Paris.

Your readers are familiar with the important role rubber tires are playing in this war; they also know that the tire industry has always been the chief rubber industry in France, and that—since we settled down and organized for war conditions—our tire manufacturers have been able to supply practically all the needs of our armies and to do much for our Allies. But what your readers probably do not know is that our rubber manufacturers have adapted their manufacturing facilities to the production of many articles that are only remotely or not at all related to rubber.

All the factories in Clermont-Ferrand are under military control; army officers, army engineers, and men in uniform have charge of everything and are doing all the work that cannot be

ARMY TRUCKS AT MILITARY REPAIR STATION.

trusted to women. I found Michelin and Bergougnan making aeroplanes; not only the rubberized fabrics for covering the wings of flying machines, but whole machines, even motors. They are doing this besides producing more tires than they ever did in peace times, and they are also turning out shells, cannon parts, artillery wheels, fuses, cartridges, and all sorts of metal and rubber sundries. Their valve departments, rim and wheel shops were found to be well suited, both as regards workmen and machinery, for producing a score of articles they never before dreamed of turning out. In one plant I saw 50 huge aeroplanes in course of completion, and practically all the men working on them had been rubber workers, mechanics, carpenters and die-makers in rubber factories prior to the war. This was a revelation to me. I had no idea of such developments in our rubber industry. I had read in *THE INDIA RUBBER WORLD* about the adaptability shown by the German rubber industry, but did not suspect that ours had equaled it in this direction. But they have perhaps gone still further. Clermont-Ferrand rubber workers are making all sorts of things that were unknown to them a year ago and they are doing it as though they had never done anything else. The organization is perfect.

ORGANIZATION.

Speaking of organization, never, in any circumstances, have French manufacturers shown greater activity, more ardent desire to complete and improve, in the economic battle-field, the victory France will owe to her incomparable soldiers.

Old organizations are rivaling in zeal and effort in the work of necessary preparation for securing new outlets for the prod-

ucts of the national industries, including the manufacture of rubber. New organizations are being constituted. Special publications are coming into being. All are working for the commercial and industrial future of our country.

Writers, who formerly devoted their time and talents exclusively to literature, are now placing their pens in the service of the work that is necessary to the France of tomorrow. All consider it a duty to complete the work of our brilliant armies. France is organizing for future economic battles, and the ardor and the excellent intentions of our people will result in positive achievements. We recognize that one of our greatest faults was lack of organization, and we have been working to correct it. Our army officers have taught much to our business men. They have shown what great things can be accomplished smoothly, with proper organization. Our army motor transport service is a model of organization. Take the rubber tire departments, for instance:

TIRE DEPOTS.

The quantities of tires consumed by thousands of vehicles under war conditions is difficult to imagine; it cannot be mentally grasped by mere multiplication of numbers. I recently visited a tire depot. I saw thousands and thousands of permanent-band solid rubber tires. Tier upon tier, pile upon pile, huge ribbed pillars; a veritable forest of them. In and out they were being rolled like huge hoops. As fast as they go out, they are replaced by new arrivals.

The pneumatic tire storage warehouses have racks built from end to end, and these racks, of great height, are filled with tires that stand upright, side by side, making walls of rubber. The multiplication of all makes and sizes is handled with system and precision.

The system is wonderful. In tire casualties, which, naturally, are very numerous, the tire and tube is quickly inspected by a staff of experts and a report sent back to the unit from which it came. When the tires are repairable, they are sorted out into two lots—one lot repairable at the depot is at once sent to the local tire repair shops, and the other lot, representing the almost unrepairable, is sent to the factory.

Useless tires are sent to a special department which attends to their disposal as rubber waste. Nothing is too small to be conserved, and waste is reduced to a minimum.

PLANTATION RUBBER IN COCHIN CHINA.

The series of articles being published in *THE INDIA RUBBER WORLD* on "Plantation Rubber in Cochin China," is the subject of great satisfaction in our rubber circles.

Most of our rubber manufacturers have large investments in these plantations, many of which are already paying propositions.

FRENCH IMPORT OFFICE IN LONDON.

Our government has opened a special office in London for the granting of licenses for the importation into France and Algeria of goods coming through London and under import prohibition in those territories.

PERSONALS.

Emil Desmidt and Eugene Roux, rubber planters in Cochin China, lost their lives during the recent fighting in the Argonne section of the Western battle front.

IMPORTANT HYDRO-ELECTRIC PROJECTS IN FRANCE.

The American Consul at Grenoble, France, reports that interest in hydro-electric development has been recently revived by the Chamber of Commerce of Grenoble to attract new industries to that part of France. Contemplated installations will use the energy furnished by the water courses of the Alps to reach an aggregate mean production of about 265,000 horse-power, and will require large quantities of insulated wire and cables, as well as other electrical apparatus.

RUBBER TIRES IN NORWAY.*By Our Regular Correspondent.*

THE prosperity now prevailing in Norway is reflected in the increased use of motor vehicles, both pleasure and business. By far the larger number of automobiles imported come from the United States, but large consignments are also received from Italy. All these are imported without tires.

Under an arrangement with the British authorities, all rubber tires are imported into Norway through London and consigned only to the Royal Automobile Club, Christiania. The club distributes the tires to the dealers, who are obliged to give guaranties that they are to be used only in Norway. The greatly increased demand for automobiles has made it difficult to obtain rubber tires sufficient to supply the requirements of the trade.

Last October, as was reported in *THE INDIA RUBBER WORLD*, the automobile club succeeded in obtaining permission to import 9,000 automobile tires, 4,800 motor tubes and 800 motorcycle tires during the current year. At that time the quantity was deemed sufficient for the needs of the country. The prosperous times, however, have upset all calculations. While on January 1, 1916, there were registered in Norway only 1,520 automobiles, the number has now increased to 2,084, and it has become apparent that the automobile supplies for which licenses had been obtained will not last through the year. The secretary of the automobile club recently went to London to confer with the authorities there on the subject, and has succeeded now in securing an extension of the limit on tires and tubes for automobiles and motorcycles.

The distribution of the tires will be handled jointly by the Royal Automobile Club of Norway and the Rubber Importers Association, organized under the auspices of the club. For every new tire delivered a worn-out one must be turned in to the club.

SOME FOREIGN RUBBER NOTES.**TIRES IN SCANDINAVIAN COUNTRIES.**

THE tire famine in Scandinavian countries continues acute, especially in Norway and Sweden.

In the early months of the war and during the year 1915 many tires were smuggled from Scandinavia into Germany, and now Great Britain, which holds the key to the tire situation in Europe, is applying most stringent measures in controlling the supply to European neutrals, allowing but small consignments, and these at infrequent times.

The result of this is that a set of average-sized tires to-day in Sweden costs the price of a Ford car in the United States. In Stockholm 34x4 tire casings sell for the equivalent of \$150 in United States gold, and \$25 is a current price for inner tubes of the same size.

SWISS TRADE IN RUBBER GOODS.

Imports of rubber and rubber goods into Switzerland during the year 1915 amounted to \$1,624,026, against \$1,562,425 during 1914. Export of similar articles amounted to \$512,428 and \$335,266 during the years 1915 and 1914, respectively.

Reexportation of raw and manufactured rubber is only allowed to those countries from which or through which the articles or raw materials have been imported and into countries that are allies of these.

The Contraband Department of the British Foreign Office has caused publication of a list of articles in respect of which licenses for export to Switzerland are only granted if the goods are consigned to the S. S. S. (*Société Suisse de Surveillance Economique*). Among the articles listed are: All forms of rubber, balata, gutta percha, raw or *re-melted* (*sic*), including waste and ebonite; rubber wares; rubber-proofed and rubber-mixed goods.

Erasers, toys, drains, gloves, injectors, dental rubber and mixed rubber wares, partly rubber, can be sent under what is known as

the small parcel scheme; that is to say, they may be exported from Great Britain to Switzerland without an acceptance certificate from the S. S. S. But this does not prejudice the right of the War Trade Department to insist on the production of a certificate from the S. S. S., where this is considered desirable. All parcels must be consigned to the S. S. S. for account of the ultimate consignee, via the International Postal Parcels Bureau, Pontarlier, France.

PORTUGUESE EMBARGO ON RUBBER.

On August 14 the Portuguese Government issued a decree declaring certain merchandise contraband of war. On a schedule of these contraband goods appear rubber, gutta percha, and similar substances, including these commodities in the crude state, reclaimed, or as waste, solutions, cements, and goods made partly or wholly thereof.

RUBBER IN HERRING BARRELS.

An English contemporary states that a German merchant, representing a German rubber factory, and three other persons, were sentenced at Copenhagen, Denmark, recently, to 120 days' imprisonment, each, and, in addition, fines, amounting to 350,000 kronen [\$91,000], were imposed for smuggling raw rubber from Denmark into Germany concealed in salt herring barrels.

JAPAN'S IMPORTS OF CRUDE RUBBER.

According to the official trade returns of Japan, the total value of crude rubber and gutta percha imported during the first six months of 1916 amounted to 3,626,000 yen [average value of yen for this period, .5075 cents] against 1,560,000 yen during the corresponding period of 1915, more than 220 per cent.

RUBBER BRINGS PROSPERITY TO SHANGHAI.

The American Consul General at Shanghai, China, reports that local investments in rubber plantations in Malaya appreciated largely in value during the year 1915 and brought much ready money into the hands of investors; the large sums invested in 1910, the year of the rubber boom, were to a certain extent recovered. The appreciation of rubber investments had a beneficial influence on retail trade, as investors who made large profits were more inclined to buy luxuries.

MULTIPLE FACTORY SYSTEM ON RUBBER PLANTATIONS.

It has for some time been the tendency on Far Eastern rubber plantations to build one or two very large buildings and there centralize the work of curing the output of the estate.

The Mooply Valley Rubber Co., Limited (Ceylon), has departed from this practice and is completing six factories—one on each division of its estates. Five of these factories will turn out high-grade crude rubber, each serving 800 to 1,000 acres, and one factory will deal entirely with scrap. Because the transport of latex will be materially less, it is considered that this multiple factory system will give as good results from an economical point of view as where one large factory is used. Other advantages will be five managers competing with each other in trying to turn out the best rubber possible, each man having the responsibility of growing, cultivating and turning out the finished crude rubber. Thus there will be interest and emulation that can hardly be expected under present conditions. Smaller individual plants will make for closer supervision and thus facilitate the production of quality as well as quantity. Another definite advantage of this system of one factory for each division is that if a breakdown or a fire occurs in any factory, there will be no great trouble in handling the latex in the other plants of the same estate.

Rubber Planting Notes.

MALAYAN PLANTERS FEAR AMERICAN INVASION.

SOME anxiety appears to exist in Malaya concerning what is termed the "American Invasion."

It is asserted that representatives of American rubber interests are seeking land grants in the Federated Malay States and the planters fear that, should the local government grant any large area to these interests, such action might add to the present difficulties of the labor question in Malaya.

Rubber estates import most of their coolies under contract and have difficulty in preventing them from breaking their agreements and going to work for native land owners. The fear is that there would be created a fresh demand for labor if large areas were to be opened up at one time.

Besides this question of shortage of labor, there is, of course, the question of wages, which the planters do not wish to see higher than the present level.

Our Malayan contemporary, "Grenier's Rubber News," suggests that a good way to obviate the danger would be to make all grants of land conditional on the Americans importing all the labor necessary, and perhaps more, for the new plantations. In other words, guarantees should be secured from American interests to safeguard the labor in the Federated Malay States from a partial or wholesale absorption by the "invaders," whose motive spirit does not appear to be questioned, our contemporary explaining: "An area of 100,000 acres opened up next year will yield probably in 1921 only about 13,000 tons of rubber, and in that year of grace the American requirements of the commodity will be more than 15 times that quantity, and Britain will still hold a great preponderance of power."

DISEASES OF PLANTATION HEVEA IN CEYLON.

From the annual report of the botanist and mycologist of the Ceylon Agricultural Society, it appears that during the year 1915 this society received 44 consignments of *Hevea Brasiliensis* disease specimens for examination.

The specimens of *Hevea* sent in for report showed that in prevalence the diseases occupy the same relative position as in former years, and, taken altogether, there appeared to be a general diminution of disease.

The "canker" fungus, *Phytophthora Faberi*, again heads the list. Pod disease caused by this fungus was severe in some districts in July; this was accompanied by heavy leaf-fall, owing to the spread of the fungus to the leaf stalks. This condition has recently been reported from South India.

Canker of the leaf stem in its early stages has been effectively treated by light scraping and treatment with 20 per cent solution of carbolineum in water.

Canker at the collar of trees was found in the Matara district, where it had nearly ringed several trees. By early and vigorous treatment it is deemed possible to lessen, to a considerable extent, the ravages of this fungus.

Towards the end of the year *Fomes lignosus* (same as *Fomes semitostus*) was reported on several occasions from the Kelani Valley. Drastic removal and burning of diseased roots and jungle stumps where these still occur in rubber clearings is recommended to reduce the losses from this cause.

Decay of the renewing cortex or "bark rot," as it is more generally termed, was somewhat prevalent about July and November, during wet weather experienced in those months. In December experimental work was initiated in connection with this disease. Inoculations of the freshly tapped surface of healthy trees with diseased bark yielded no cases of infection. Treatment with 20 per cent water solution of carbolineum appeared to mitigate the

severity of fresh attacks, but had no immediately apparent effect in arresting the rot of bark already affected.

This disease would appear to be capable of explanation on purely physiological grounds.

Treatment of diseased areas with clay and cowdung mixtures is being tried as a means of accelerating the process of occlusion of exposed wood surfaces.

One case of *Poria hypolateritia* killing young *Hevea* was observed on the Experiment Station at Ganoruwa.

A case of *Colletotrichum ficus* was recorded on *Hevea* leaves.

The rubber research chemist of the Ceylon Agricultural Society started an investigation into the formation of latex cells in conjunction with the botanist and mycologist in August, 1915. This research will cover a period of at least one year in order to allow of observations being made in various seasons of the year.

Observations made on samples of bark from numerous trees indicate that the number of rows of latex cells varies to a considerable extent, according to the height from the ground.

INSECT PESTS OF HEVEA IN CEYLON.

In a recent number of "The Tropical Agriculturist," the Assistant Entomologist of the Department of Agriculture of Ceylon states that *Hevea* rubber on Ceylon plantations appears to maintain almost complete immunity from insect ravages. Such pests as have been reported during the past year were either scarcely pests at all or confined their attacks to sickly or diseased trees. No reason can be assigned for this, other than the one put forward by Mr. Green some years ago,—that the latex acts as a strong deterrent against any attempt to penetrate the bark. The following pests were reported during the fiscal year 1915-1916:

Mariella dussumieri the rubber slug, was reported as drinking latex, in Udugama in March.

Scolytidae, boring beetles, were reported several times but, on investigation, it appeared that the borers attack only unsound bark, and are probably attracted by the fungi which grow in it and not by the bark or the wood.

Lecanium nigrum, the black scale insect, was reported from various districts in August and October, but in each case it appeared to do little harm.

Batocera rubus, root and stem borer, was reported from Pelmadulla in November, when it was taken from the stem of a rubber tree which had fallen down through the damage done by the grub.

THINNING OUT RUBBER.

Our Ceylon contemporary, the "Tropical Agriculturist," publishes the following table, showing the result of thinning out rubber on a plantation 20 years old:

FIFTEEN ACRES OLD RUBBER.

Season.	Crop.	Yield Per Acre.	Trees.	Trees Per Acre.	Rain-fall.
1907-08	4,003	267	2,419	161	145.41
1908-09	4,020	268	2,419	161	168.49
1909-10	5,146	343	2,419	161	137.65
1910-11	6,594	439	2,419	161	142.64
1911-12	6,425	428	2,419	161	167.02
1912-13	6,532	435	2,419	161	161.41
1913-14	6,001	400	2,180	145	196.84
1914-15	6,596	439	1,604	106	134.97

These figures show that profitable results follow the thinning out of a plantation, even of this age; at least, under certain conditions. There are no data for laying down definite conclusions on this subject. It depends upon so many factors: the original spacing, climate and price of rubber.

The Committee of Agricultural Experiments of the Ceylon

Agricultural Society holds that thinning out should not be delayed too long, but should be done early enough to allow the trees ample opportunity to branch.

The Experiment Station of the Ceylon Agricultural Society is cutting out two small plots of *Castilloa* rubber, having decided that the space could be more usefully planted with other products. A few specimen trees will, however, be retained.

PLANTERS IN ARMY SERVICE.

The "Malay Mail" of Kuala Lumpur, Federated Malay States, as a supplement to its August 4 issue, publishes a "Roll of Honor" containing a list of names of present or past residents of the Malay States under British protection, who have lost their lives in the present war. This is followed by a list of such residents who have been, or shortly will be serving in the British army. It will be noted that by far the majority of the names on both lists are those of planters, or men in some way connected with the planting industry.

PROHIBITED EXPORTS FROM INDIA.

A notification issued by the Department of Commerce and Industry of India contains a revised list of articles, the exportation of which is at present prohibited from British India. Among these articles appears rubber, raw and manufactured, which cannot be exported to any destination except the United Kingdom, France, Russia (except the Baltic ports), and British possessions or protectorates.

BARK ROT OF *HEVEA* IN BURMA.

THE Department of Agriculture of British Burma has published a most interesting bulletin on "Black Thread Disease of *Hevea* in Burma," by I. F. Dastur, First Assistant Imperial Mycologist at Pusa, Burma.

The "black thread disease" is what is commonly known in Ceylon as "bark rot," and has received repeated mention in THE INDIA RUBBER WORLD.

The naked tissues laid bare by tapping become disfigured and damaged by the appearance of vertical, slightly depressed black lines. These follow the tapping cut as it is continued down the trunk of the tree and extend through the cambium into the wood. The blackening of the tissues runs along the tapped area and eventually covers the whole cut. Diseased areas soon become vertically cracked, especially in wet weather. From the vertical cracks latex occasionally exudes. In some cases there is a thick wad of coagulated latex between the diseased renewing bark and the wood; in these cases the cambium is completely destroyed and there is always a bulging out of the diseased renewing bark. This soon decays, leaving behind a gaping wound, exposing the wood. A true "canker" is thus formed. It is the damage to the cambium which constitutes the most serious feature of the disease, for it is upon the activity of this tissue that the tree depends for the smooth and even regeneration of the bark cut away during tapping.

Careful inoculation experiments conducted by Mr. Dastur, with pure cultures, have proved that this disease is caused by the same fungus, a species of *Phytophthora*, which attacks fruits and causes them to rot, and to which certain experts have attributed the cause of abnormal leaf-fall. Inoculation experiments on tapping cuts, renewing bark and old bark showed that the fungus was capable of attacking the tree only through wounds. Inoculations made on uninjured parts of the stem and branches invariably failed, while those on the wounded surface were successful.

The disease first makes its appearance soon after the rains set in, and completely disappears after the close of the wet season. Even during the monsoon, the progress of the disease is checked during a long break. The annual recurrence of the disease on the stem has not been found to originate from the infected areas

of the previous year, but has been observed to be due to fresh infection. On an infected area the disease spreads downward, following the tapping cut; if tapping is stopped the spreading of the disease is stopped. This is what would be expected from the discovery that the trouble is caused by a parasitic fungus. The fungus, however, lies dormant when tapping is stopped during the monsoon, and resumes its activity when tapping is recommenced any time during the rainy period.

The fungus spreads most rapidly in wet weather, and it is pointed out that closely planted trees, which create a dark, moist atmosphere, favor the disease. This leads the author to suggest that one of the best methods of control is to thin out the trees so as to let in more light and air. The application of fungicides, like Burgundy Mixture, was a failure, though a 20 per cent solution of carbolinum is said to have been a success in Java. Cessation of tapping at the first appearance of the disease, and collection and destruction of all diseased fruits, are recommended by the author as practical means of control. The latter is, however, a difficult procedure in rubber estate practice and requires much labor.

Commenting on this report, the "Planters' Chronicle" says that in South India it has been found that a combination of cessation of tapping on attacked trees, with the application of a thin smear of a mixture of tar and tallow applied to the diseased spot, has proved very effective. The mixture is applied with the finger and then rubbed with a small piece of gunny cloth, so as to confine the smear to the bark area attacked. Its action appears to be twofold. The tar acts as an antiseptic, while the tallow forms a waterproof covering, and thus deprives the fungus of the moisture so necessary for its growth and welfare. After the monsoon, the treated areas gradually shed a thin scale of tar-coated bark and expose a clean, healthy surface beneath.

Covering the tapped surface with a mixture of cowdung, clay and sulphur has also been found beneficial; the bark renews quickly and well enough beneath this covering, and the bark rot is reduced. The mixture may be best made by boiling one ounce of sulphur in half a kerosene tin of water and adding equal parts of clay and cowdung till a thick paste is obtained. The addition of a pinch of salt tends to keep the mixture moist and to prevent it from cracking, after application. This mixture is chiefly applied in the dry weather. It prevents the tapped area drying out and promotes good bark renewal. It appears also to have a beneficial effect, as far as bark rot is concerned, when the rains begin. In Ceylon the mixture is applied each month, within a quarter of an inch of the tapping cut, but in South India it is usually applied over the tapped area when tapping ceases, as it does in some districts, on account of the dry weather.

It is interesting to note that the mycologist in Burma has been successful in inoculating healthy trees with the disease, whereas, in Ceylon, experiments undertaken by the Ceylon Committee of Agricultural Experiments did not show the same result. Working on this disease in Ceylon, Mr. Bryce was inclined to attribute it to a physiological effect, and not to fungus disease at all. Mr. Bryce failed in his attempts to inoculate trees with the disease, and his theory was, apparently, that in wet weather the formation of the cork layer which protects the cells of the inner tissue, and of the wood cambium, was delayed. This causes cells to die locally, and the decomposition products thus set free infiltrate into the neighboring cells and kill them. It may be that the black thread disease in Burma is different in nature from the "bark rot" disease of Ceylon plantation *Hevea*; however, Mr. Dastur is to be congratulated for having definitely proved this disease in Burma to be due to the presence of a fungus, as the first real step towards the control of plant disease is to discover to what it is due.

THE ISLAND OF HAINAN, CHINA, WILL SOON NEED RUBBER machinery in order to bring its plantation product up to the standard qualities in the Singapore market.

- 1,199,144. Rubber tissue in making wigs. Zan Zax, Los Angeles, Calif.
- 1,199,236. Puttee or spat having a main portion of elastic material. J. Boyd, Clonbur, Galway, Ireland.
- 1,199,264. Pneumatic tire. H. E. Grabau, Long Island City, N. Y.
- 1,199,456. Rubber brush for bottle cleaning machines. O. Eick, St. Louis, Mo.
- 1,199,509. Wind shield cleaner with a rubber strip. W. F. Tesnow, Chicago, Ill.
- 1,199,562. Tire protector. C. Jordan, Pittsburgh, Pa.
- 1,199,644. Inner tube ends mechanically joined within the casing. C. S. Wert, Kendallville, Ind.
- 1,199,660. Demountable rim. C. Braniff, Cincinnati, Ohio.
- 1,199,670. Massage apparatus for attachment to a sewing machine. B. L. Davis, Detroit, Mich.
- 1,199,686. Tire clamp. H. J. Geake, Victoria, British Columbia, Canada.
- 1,199,698. Antiskid-chain. A. J. Heinsius, Charleroi borough, assignor of one-half to C. C. Dieter, Pittsburgh—both in Pennsylvania.
- 1,199,702. Combination inflatable life saving and swimming device. G. W. Johnston, St. Joseph, Mo.
- 1,199,717. Tire filler. D. H. Shapiro, Montreal, Quebec, Canada.

ISSUED OCTOBER 3, 1916.

- 1,199,789. Electrical conductor. M. Hochstadter, Harrisburg, Pa.
- 1,199,817. Rubber heel. E. T. Packard, Avon, Mass.
- 1,199,826. Hose clamp. A. F. Schroeder, Cleveland, Ohio.
- 1,199,837. Shaving brush. C. E. Thompson, assignor of one-half to F. H. Wager—both of Troy, N. Y.
- 1,199,859. Rim for metallic vehicle wheel. E. K. Baker, assignor to Universal Rim Co.—both of Chicago, Ill.
- 1,199,892. Pneumatic tire. E. H. Herrick, New York City.
- 1,199,902. Rubber heel in which is embedded a coiled spring. E. Kempshall, Washington, D. C.
- 1,199,914. Leg warming boot comprising an inner waterproof stocking. W. O. Mosser, assignor of one-half to P. S. Williams—both of Looneyville, W. Va.
- 1,199,993. Fountain pen with a collapsible ink sack. G. M. Kraker, assignor to Kraker Pen Co.—both of Kansas City, Mo.
- 1,200,015. Bead, etc. M. Paridon, assignor of one-half to H. A. Rudd—both of Barberton, Ohio.
- 1,200,031. Pneumatic tire shoe. H. A. Rudd, assignor of one-half to M. Paridon—both of Barberton, Ohio.
- 1,200,237. Emergency tire. V. E. Reichard, Perry, N. Y.
- 1,200,255. Auxiliary metal tire for wheels. W. A. Steele, Los Angeles, Calif.
- 1,200,291. Cushion tire comprising a metal shoe and rubber tube. C. F. Adams, Pavo, Ga.
- 1,200,355. Tire protector. J. O. Howard, Austin, Texas.
- 1,200,358. Tire valve. C. A. Iorns, St. Louis, Mo.
- 1,200,418. Self-inflating tire. J. Fernandez, Brownsville, Texas.

ISSUED OCTOBER 10, 1916.

- 1,200,566. Demountable tire. R. Wright, assignor of one-half to F. J. Bommer, Jr.—both of Cleveland, Ohio.
- 1,200,596. Rubber tooth brush which slips over the finger. J. A. Daly, New Rochelle, N. Y.

- 1,200,602. Bottle cleaner. J. Freund, assignor to E. Schwarz—both of Chicago, Ill.
- 1,200,616. Life-saving device. R. W. Hudson and H. B. Spencer, assignors of one-fourth to R. W. Nichols—all of Ottawa, Ontario, Canada, and one-fourth to A. E. Hudson, Calgary, Alberta, Canada.
- 1,200,623. Tire valve. H. P. Kraft, Ridgewood, N. J.
- 1,200,671. Tire protector. L. L. Warr, Malden, Mass.
- 1,200,779. Platen for typewriting machine. W. A. Thompson, Belleville, Ill.
- 1,200,807. Antiskidding tire protector. A. L. Burdt and J. Taylor, Chardon, Ohio, assignors of three-fourths to said Burdt and one-fourth to said Taylor.
- 1,200,874. Combination of a tire and an inflating pump connected directly thereto. G. E. R. Rothenbucher, New York City.
- 1,200,933. Inflatable life-saving and swimming belt. I. Fraki and W. A. Merila, Hancock, Mich.
- 1,201,045. Closure device for toy balloons. R. Head, New York City, assignor to Howe Baumann Balloon Co., Newark, N. J.
- 1,201,089. Demountable rim. H. J. Parker and J. R. Bradford, San Francisco, assignors of one-half to L. P. Woodbury, Berkeley—both in California.
- 1,201,117. Vehicle wheel rim. J. H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., and one-fifth to the United States Tire Co.—both of New York City.
- 1,201,118. Vehicle wheel rim. J. H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., and one-fifth to the United States Tire Co.—both of New York City.
- 1,201,119. Vehicle wheel rim. J. H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., and one-fifth to the United States Tire Co.—both of New York City.
- 1,201,120. Vehicle wheel and rim therefor. J. H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., one-fifth to the United States Tire Co.—both of New York City, and one-fifth to the United Rim Co., a corporation of Ohio.
- 1,201,121. Vehicle wheel rim. James H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., one-fifth to the United States Tire Co.—both of New York City, and one-fifth to the United Rim Co., a corporation of Ohio.
- 1,201,122. Vehicle wheel rim. James H. Wagenhorst, assignor of one-fifth to the Goodyear Tire & Rubber Co.—both of Akron, Ohio; two-fifths to The B. F. Goodrich Co., and one-fifth to the United States Tire Co.—both of New York City.
- 1,201,129. Demountable rim. L. P. Woodbury, Berkeley, assignor of one-half to J. T. Parker, San Francisco—both in California.
- 1,201,198. Dust cap for tire valves. H. P. Kraft, Ridgewood, N. J.
- 1,201,199. Dust cap for tire valves. H. P. Kraft, Ridgewood, N. J.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 6, 1916.]

- 7,192 (1915). Waders. D. Grant, 122 George street, Edinburgh.
- 7,193 (1915). Armored diving dress. W. P. Thompson, 6 Lord street, Liverpool.
- 7,194 (1915). Diving dress joints with rubber packing rings. W. P. Thompson, 6 Lord street, Liverpool.
- 7,228 (1915). Waterproof cloth recompression chamber for the treatment of divers overcome by excessive pressure. H. Dragerwerk and B. Drager, 53 Moisliger Allee, Lubeck, Germany.
- 7,285 (1915). Top lift for heels made from rubber, gutta percha, or a mixture of cork and rubber solution. Soc. Francaise Du Cuir Arme, 57 rue Alexandre Dumas, Paris.
- 7,296 (1915). Artificial foot which comprises a rubber block. A. Smith, 47 Bachelor Lane, Horsforth, Yorkshire.
- 7,368 (1915). Ladies' garter consisting of connecting straps above and below the knee. E. H. Reid, Chaldon Hill, Ellinbank, Victoria, Australia.
- 7,408 (1915). Reservoir pens. C. Bristow, 20 St. German's Road, Forest Hill, London.
- 7,464 (1915). Rubber heel core for artificial feet. J. F. Rowley, 25 West Madison street, Chicago, Ill.
- 100,874. Tire armor. J. K. Black, 22 Glen street, Paisley, Renfrewshire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 13, 1916.]

- 7,536 (1915). Puttee having a woven elastic section. J. Boyd, Ebor Hall, Clonbur, Galway, Ireland.
- 7,538 (1915). Washer made of rubber and fabric. F. H. Rogers, Broad Sanctuary Chambers, Westminster.

- 7,670 (1915). A map for use either as a plane or spherical map comprising elastic material. E. A. Reeves, Royal Geographical Society, Kensington Gore, London.
- 7,721 (1915). Fountain pen. F. Oliver, Clifton street, Stourbridge.
- *7,790 (1915). Brasiere formed of a number of strips of elastic material. E. Guggenheim, 252 West Twenty-ninth street, New York City.
- 7,810 (1915). Life buoy with rubber diaphragm and bands. P. De Luca, Scuola Allievi Uciali Royal Carabinieri, Rome, Italy.
- 7,816 (1915). Tire valve. J. Huybrechts, Mortsels-Anvers, Belgium.
- *100,897. Cooling device for pneumatic tires. P. J. Cuddihy, P. O. Box 92, Rutherford, N. J.
- *100,905. Detachable rim attachments. I. D. Walter, J. Brinkerhoff, E. F. Cole, J. G. Gant, T. Flournoy, J. W. Gant and S. A. Latimer, Harrisburg, Arkansas.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 20, 1916.]

- 7,930 (1915). Combined waterproof cape and ground-sheet. J. G. Sava gar, 43 Brompton Road, London.
- 8,007 (1915). Rubber set brush. Brush Co., 21 Bucklersbury, London, and A. H. Timmis, "Fairmount," Harrow View, Harrow, Middlesex.
- *8,029 (1915). Tire valves. R. H. Henemier, 501 West 138th street, New York City.
- *8,036 (1915). Flanged wheels with rubber cushions. E. C. Madden, 1180 Broadway, New York City.
- *8,054 (1915). Detachable rim. E. P. Calvin, Sardinia, Ohio.
- 8,118 (1915). Dolls, figures, toy animals and similar articles comprising a rubber bladder. H. S. Dean, 160a Fleet street, London.
- 8,165 (1915). Repairing pneumatic tires by wrapping with rubberized tape. W. A. Leslie, Central Hotel, Short Market street, Cape Town, South Africa.
- *100,973. Springwheels with solid rubber tires. A. J. Anderson, 1340 Park avenue, Chicago, Ill.
- 101,018. Tire valves. Naamloze Vennootschap Holland Ventiel, Heelsun, near Arnhem, Holland.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, SEPTEMBER 27, 1916.]

- 8,228 (1915). Solid tire and attaching means. T. Gare, Cumberland House, Park Lane, Wembley, Middlesex.
- 8,390 (1915). Raft formed of tubular vessels of flexible rubbered materials. A. Candelon, 40 Rue de la Republique, St. Mande (Seine), France.
- *8,511 (1915). Rubber-covered spring for vacuum bottles. E. C. R. Marks, 57 Lincoln's Inn Fields, London. (Landers, Fray & Clark, New Britain, Connecticut.)
- 8,533 (1915). Jar ring. H. Hartmann, Globus, Gummi und Asbestwerke Ges., Ahrensbock, Germany.
- *101,028. Inflatable life preserver. B. Franklin, 2118 North Kostner Avenue, Chicago, Ill.
- 101,040. Life-saving belt or swimming appliance comprising a number of permanently inflated rubber balls. H. Brookes, 307 Pershore Road, Stirlchley, Birmingham.
- 101,054. Detachable rim. W. M. Douglas, 6 Bean street, Waterford.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 4, 1916.]

- 8,627 (1915). Tire rim attachments. H. W. Van Meeteren, 58 Poplar Road, Edgbaston; A. Edwards, 44 Milcote Road, Bearwood, and H. Headley, "Merton," Oxford Road, Moseley—all in Birmingham.
- 8,727 (1915). Attaching block ties to rims. Mail Motors, Limited, and J. B. Gould, 3 The Crescent, Birmingham.
- *8,756 (1915). Tennis or other inflated playing ball. R. H. Rosenfeld, 1895 East 71st street, Cleveland, Ohio, and F. T. Roberts, 17 Lee avenue, Trenton, N. J.
- 8,787 (1915). Apparatus for saving life for use in combination with waterproof suit. R. D. Buchanan, 7 Hencotes street, Hexham, Northumberland.
- 8,827 (1915). Pneumatic tire cover of rubber, canvas and leather. J. B. Salmon, Filleul street, Dunedin, New Zealand.
- 8,909 (1915). Respirator head-piece comprising rubber disks and bands. W. Single, The Grove, Woodfor, Essex.
- 8,950 (1915). Cushion tire. W. E. H. Humphrys, Cranbourne Lodge, Hendon, Middlesex.
- *101,065. Puncture closer consisting of a head and cap of soft rubber, etc. R. W. Sampson, Melba, New York.
- 101,074. Rubber strips in a device for turning the legs of high-legged boots. F. Ricks and British United Shoe Machinery Co., Union Works, Belgrave Road, Leicester.
- *101,096. Air tube for tires. N. C. Doss, Rome, Georgia.

THE DOMINION OF CANADA.

ISSUED JULY 31, 1916.

- 170,488. Inflatable life preserver. The American Life Buoy Co., assignee of B. Franklin—both of Chicago, Ill.
- 170,493. Rubber sole. The Canadian Consolidated Rubber Co., Limited, assignee of W. B. Wiegand, and T. H. Rieder—all of Montreal, Quebec, Canada.
- 170,494. Hand rail of fabric and rubber for escalators. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of H. Z. Cobb, Winchester, Mass.
- 170,530. Life-saving garment comprising an inflatable tube. W. R. Pike and T. S. Morton, co-inventors—both of Tuxedo Park, New York.

*Denotes patents for American inventions.

- 170,578. Necktie having a sheet rubber lining. W. Hey, York City, York, England.
- 170,650. Hand rail for escalators comprising a channelled member of vulcanized rubber. Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of H. Z. Cobb, Winchester, Mass.
- 170,772. Air hose coupling. J. Roy, Los Angeles, Calif.
- 170,898. Gutta percha and rubber tire patch. J. G. Moomy, Erie, Pa.
- 170,962. Tire valve. A. Schrader's Son, assignee of R. H. Henemier—both of New York City.
- 170,963. Tire valve. A. Schrader's Son, assignee of R. H. Henemier—both of New York City.
- 171,002. Tire cover. T. Bélair, Montreal, Quebec, Canada.
- 171,007. Repair heel for rubber overshoe. J. Capdevila, New York City.

NEW ZEALAND.

ISSUED AUGUST 17, 1916.

- 36,659. Milking machine teat cup. The Ridd Milking Machine Co., Limited, Queen street, assignee of A. Ridd—both of New Plymouth, New Zealand.

ISSUED AUGUST 31, 1916.

- 36,986. Waterproof life buoy. J. B. Adams, Christchurch, N. Z.
- *37,103. Molded inner tube for pneumatic tires, characterized by having a fixed formation when deflated. H. C. Boggs and C. E. Frost—both of Athens, Alabama.

FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

- 480,007 (October 15, 1915). Improvements in detachable tires. J. H. Coffey and J. H. Coffey, Jr.
- 480,025 (January 25). Articulated metal tread band for wheels of vehicles equipped with dual elastic tires. Société Schneider & Cie.
- 480,144 (October 20). Protection plates for rubber tires and tires made of similar elastic materials. B. C. Gray.
- 480,166 (July 29). Special tire for automobiles. K. Pauli and Mme. Benninger.
- 480,259 (November 18). Improvements in rubber pads and findings for heels and soles of footwear. W. W. Phillips.
- 480,306 (November 24). Article to repair rubber hose by vulcanizing. A. B. Low.
- 480,363 (November 30). Anti-skid device for pneumatic tires. G. N. Givone.
- 480,387 (December 3). Vehicle tire. F. Lotter.
- 480,441 (December 14). Sectional pneumatic tire. G. M. Chanler.

TRADE-MARKS.

THE UNITED STATES.

- 94,243. Padlock design composed in part of a tire, and the words BATAVIA SECURITY TIRES—rubber tubes and tires. The Batavia Rubber Co., Batavia, N. Y.
- 94,091. The word LUSTRE—red mason-jar rings. R. E. Tongue & Bros. Co., Philadelphia, Pa.
- 96,225. The word PLANTINE—an amalgamating preparation of rubber. S. A. Conover, Philadelphia, Pa.
- 96,884. The words PAN AMERICAN—rubber tires and tubes for automobiles, aeroplanes, trucks and the like. Automobile Sundries Co., New York City.
- 79,127. The words BOSTON BELLE—rubber shoes, clothing, etc. The Tremont Stores, Inc., Boston, Mass.
- 82,333. The words and numeral BRUNALCOL No. 3—billiard-cloth. The Brunswick-Balke-Collender Co., Chicago, Ill.
- 82,334. The words and numeral BRUNALCOL No. 4—billiard-cloth. The Brunswick-Balke-Collender Co., Chicago, Ill.
- 94,090. The words BIG CHIEF—fruit jar rings. R. E. Tongue & Bros. Co., Philadelphia, Pa.
- 96,267. An illustration of a bee-hive with the letter B—tire-tape, rubber and adhesive patches. Berrodon Rubber Co., Philadelphia, Pa.
- 96,369. The words ADONIS QUALITY—solid and pneumatic tires, reliners, blow-out patches and tire patches composed of rubber, etc. Shadbolt & Boyd Iron Co., Milwaukee, Wis.
- 96,573. A representation of a roll of brake lining with a series of white transverse marks placed at regular intervals along the face of the brake lining—brake linings. Standard Woven Fabric Co., Walpole, Mass.
- 96,595. The word DUNDEE formed in a half circle over the letter A—insulated wire and cables. The Okonite Co., New York City.
- 96,596. The word DUNDEE formed in a half circle over the letter B—insulated wire and cables. The Okonite Co., New York City.
- 96,950. The numerals and word 2 IN 1—athletic ankle supports. H. J. Collis, Taunton, Mass.
- 95,880. Representation of a tire with the word PLUGIT in the center—tire-sealing compound. Cline, Crowell & McCorkle, Newton, N. C.
- 96,854. The word RAYNSTER—rain-coats. United States Rubber Co., New Brunswick, N. J.

THE DOMINION OF CANADA.

- 21,858. Representation of a hydroplane and the words MADE IN CANADA—waterproof and showerproof garments including headwear. Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.

THE UNITED KINGDOM.

- 371,918. The word NUGER—rubber erasers. Gebrøders Rijkers, Amsterdam, Holland.
- 371,957. The word ELK enclosed in a circle with a drawing of the animal of the same name composition in the nature of a packing. Leicester Castings & Engineering Co., Leicester.
- 372,159. A monogram composed of the letters B. R. M.—rubber fuse cases. British Rubber Manufacturers, Limited, Agnes Works, Agnes Road, Acton, London, W.
- 372,580. The word NUGGER beltings. Aktieselskap Den Norske Remfabrik, Christiania, Norway.
- 372,817. The word IMPACTOR apparatus for registering the properties of the flight of golf balls. Charles Guthrie Guthrie, Glasgow.
- 373,018. The words BRITONS CUR—rubber heels, tips and pads for boots and shoes. Wood-Milne, Limited, Bow Lane, Preston Lancs.
- 373,131. A shield bearing crossed hockey clubs—tobacco pouches of rubber. J. B. Ingram & Son, The London India-Rubber Works, Felsted street, Hackney Wick, London, N. E.
- 373,170. The word VICEROY—braces and sock suspenders of elastic fabric containing rubber. Faire Bros., Limited, Leicester.
- 373,259. The word AUGTHOS—elastic belts and similar articles. Léon Thomas, Paris, France.
- 373,327. The words WATER MILL PAD on the wheel in a picture of a water mill—rubber heel pads for boots and shoes. Rocco Antonio Barilone, Deptford, London, S. E.
- 373,331. The word CLINCHER—all rubber goods included in Class 27. The North British Rubber Co., Limited, Castle Mills, Edinburgh.
- 373,332. The word CLINCHER—all goods included in Class 28—Same.
- 373,333. The word CLINCHER—all goods included in Class 31—Same.
- 373,334. The word CLINCHER—all goods included in Class 32—Same.
- 373,418. The words DANDY LION—packings. James Walker & Co., Limited, Poplar, London, E.
- 374,208. The word FLEPHANT—rubber insulated electric cables. Collender's Cable and Construction Co., London.
- 374,209. The word DAFFODIL— Same.
- 374,211. The word THISTLE— Same.
- 374,212. The word ROSE— Same.

THE FRENCH REPUBLIC.

- 1,310. The words LES CAOUTCHOUTIERS RÉUNIS—supplies and sundries made of rubber, such as rubber heels and soles, interior "heel protectors," interior soles, rubber footwear. J. B. Jeuge, Clermond-Ferrand, Puy-de-Dôme.
- 1,311. The word TROTTIN— Same.
- 1,312. The word PATRIA— Same.
- 1,313. The word MIDINETTE— Same.
- 1,314. The word MINET— Same.
- 1,315. The word SCHAH— Same.
- 1,316. The word DOCKS— Same.
- 1,317. The word CHATON— Same.
- 1,318. The word COOPÉ— Same.
- 1,319. The word ANGORA— Same.
- 1,320. The word CHAT— Same.
- 1,321. The word CHAMPION— Same.
- 1,322. The word GLOBE— Same.
- 1,382. The word TOURISTE—tobacco pouches. Louis Guichard, Sainte-Claude, Jura.
- 4,081. The words Y. A. BON—rubber nipples and rubber heels: sundry rubber goods. Yves Bourgeois, Nantes, Loire-Inférieure.
- 4,082. The words YA. BON— Same.
- 4,083. The word YARON— Same.
- 9,748. The initials L. A. N.—rubber goods such as tobacco pouches, soles and heels, footwear, waterproof fabrics, erasers, pen holders, etc. Société Lyonnaise de l'Afrique du Nord, Lyon.
- 10,047. The initials D. B.—small pouches containing a thin sheet of rubber and other material for dressing wounds. Madame Claudia Boizet Desroches, Lyon.
- 24,030. The word WOODITE for rubber and gutta percha goods. Woodite Co., Limited, Mitcham-Common, Surrey, England.
- 24,148. The word DEXINE—rubber goods. DEXINE, Limited, DEXINE Works, Abbey Lane, Stratford, London, England.
- 161,654. The word PLASTINE—plastic materials. Société Générale pour la Fabrication des Matières Plastiques, Paris.
- 161,731. The words LE POILU—hard rubber combs. Société E. Maikignac et A. Robineau, Paris.
- 162,031. The words ROUE BLINDÉ—detachable wheels for rubber pneumatic tires to be used on motor vehicles. Société Française des Roues Amovibles, Ivry-Port, Seine.
- 162,196. The word CILFRANC—special rubber tube. Alfred Désiré Gillard, Paris.
- 162,227. The word PANDORE—rubber toys. Mlle. Valentine Thomson, Paris.
- 162,435. The word SIMPLEX—transmission and conveyor belts. Compagnie des Simples, Paris.
- 162,642. The words MAROC SPÉCIAL—rubber heels. Emile Moyse, Paris.
- 162,643. The words BOSTON HEEL— Same.
- 162,644. The words MASCOTTE SPÉCIALE— Same.
- 162,645. The word PHÉNIX— Same.
- 162,646. The words AMERICAN BLACK—interior rubber heel protector. Emile Moyse, Paris.

DESIGNS.

THE UNITED STATES.

- 49,677. Non-skid tire. H. J. Schluckebier, Frankenmuth, Mich.
- 49,706. Tire tread. H. F. Davenport assignor to Brunswick-Balke-Colender Co.—both of Chicago, Ill.
- 49,714. Non-skid tread. R. J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.
- 49,715. Non-skid tread. R. J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.
- 49,753. Tire. A. Y. Tucker, Mount Vernon, N. Y.

PRINTS.

- 4,488. WEARING APPAREL AND RUBBER GOODS—for wearing apparel and rubber goods. United States Rubber Co., New Brunswick, N. J., and New York City.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, etc., required by the Act of Congress of August 24, 1912, of THE INDIA RUBBER WORLD, published monthly at New York, N. Y., for October 1, 1916.

STATE OF NEW YORK } ss.
COUNTY OF NEW YORK }

Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. MacPhee, who, having been duly sworn according to law, deposes and says that she is the Business Manager of THE INDIA RUBBER WORLD, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers, are:

Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.

Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

Managing Editor, None.

Business Manager, E. M. MacPhee, 25 West Forty-fifth street, New York City.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock):

Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by her.

E. M. MACPHEE, Business Manager.

IRON HEEL FOR RUBBER BOOT.

In the October, 1909, issue of THE INDIA RUBBER WORLD appeared an illustrated description of the "7-League" rubber boot, which has a special sewed leather sole. This boot has continued

deservedly popular and now an improvement is offered, the full iron heel here shown. The strength and wearing quality of such a heel is self-evident. It is not at all cumbersome, weighing about the same as a leather heel owing to its hollow construction. Made of malleable iron, it is warranted not to break, and the back of the heel is corrugated in pyramid shape to prevent slipping.

The boot is as well insulated as before, as the screws which hold the heel on do not enter the rubber sole. It is claimed that this heel cannot be pulled off and will not wear out during the life of the boot. [Mulconroy Co., Philadelphia, Pennsylvania.]

Review of the Crude Rubber Market.

Copyright, 1916.

NEW YORK.

THE long period of comparative stagnation that has characterized the New York market for the past four months is unusual in the history of the trade. While the large buyers are supposed to be carrying ample emergency stocks, it was believed that the fall, which is the initial period for selling rubber goods, would see active covering of crude rubber requirements. Lower prices have been confidently expected by the consuming trade, based on the assuring reports of increased production.

The month of October, just passed, has only shown slight evidences of the expected heavy buying movement, and instead of lower prices, the range of values has been, in fact, upward.

The temporary fright occasioned by the nearby German submarine operations was reflected in crude rubber by a sharp advance of 3 to 5 cents on October 9, when war risks went to 5 per cent and grave uncertainty was felt concerning the future of freights and rubber supplies. When the danger subsided, insurance receded to 1½ per cent and in a few days the market had declined about 2½ cents. Easier conditions were in evidence later and lower prices prevailed until the last week of the month, when the market became firmer and prices again took an upward trend. On October 30, First latex spot was 63½ cents, Smoked sheet ribbed, spot, 63 cents, January-June 63½ cents. The market was strong on all grades.

The unusual position of Upriver fine is due to drought and the consequent low water on the Amazon that has prevented the usual arrivals of rubber at this time of the year. Moreover, the supplies necessary for the *seringucros* are being detained by the same cause and will undoubtedly delay the future arrivals of Para sorts. Russian buying is another well-known reason for the strong position of Upriver fine. On October 30 this grade was selling for 81 cents spot in a firm market, futures 79 cents. For a period approximating the first three weeks of October, about 3,465 tons of rubber arrived at the port of New York, divided as follows: Plantation from Ceylon, 1,000 tons; Singapore, 400 tons; London and Liverpool, 600 tons; Para from Brazil, 500 tons; Centrals, 700 tons; Africans, 125 tons; Manicoba, 80 tons; Guayule, 60 tons.

LONDON.

The past month has been, altogether, quiet, with trading confined to dealers' sales and the covering of short requirements. Prices have been generally firm in a gradually advancing market that has recorded gains of about 2 cents during the month. The real buying interests have, however, failed to follow the rise in prices, preferring to take the necessary chances involved. This policy has been also observed in forward sales which have been freely offered here at prices that are too close to spot quotations to be interesting. On October 28, First latex was 59.7 cents, Smoked sheet 56.7 cents, and January-June, 60.2 cents in a strong market.

London imports for September were 6,000 tons, against 4,320 for August. Liverpool imports for September were 1,160 tons, against 1,100 tons for August.

SINGAPORE.

The result of the auctions held September 29, October 6, 12, 20 and 26 was as follows: Pale crêpe averaged 54.2 cents and Smoked sheet 53.6 cents. Amount sold, 2,555 tons. For the period from September 8 to 14 inclusive, the export duty on rubber was assessed on a price of 48.8 cents per pound for all grades.

COMPARATIVE NEW YORK PRICES FOR OCTOBER.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"There has been but little change this month in the general market for Commercial Paper, although not so many city banks are buying as recently, but the best rubber names have gone freely at 4@4½ per cent., and those not so well known 5@5½ per cent.

PLANTATION RUBBER FROM THE FAR EAST.

TOTAL EXPORTS FROM MALAYA.

(From January 1, 1916, to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

To—	From Singapore, July 31, 1916.	From Malacca, July 31, 1916.	From Penang, July 31, 1916.	From Port Swettenham, September 1, 1916.	Totals.
United Kingdom.....	17,765,687	3,967,630	13,174,434	20,679,766	55,587,517
The Continent	7,256,905	51,200	7,308,014
Japan	2,572,014	2,572,014
Ceylon	267,963	362,933	1,178,941	809,837
United States	47,692,888	6,011,333	53,704,221
Australia	184,314	184,314
Totals	75,739,771	3,967,630	19,599,900	21,858,707	120,166,008

For same period, 1915 40,042,540	5,346,805	15,031,996	21,276,328	71,697,669
For same period, 1914 24,175,230	3,234,581	11,521,466	20,637,311	59,568,588
For same period, 1913 13,938,262	8,222,533	19,946,488	42,107,283

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of September as 6,376 tons, against 5,782 tons in August last, and 3,984 tons in the corresponding month last year. This gives a total of 44,302 tons for nine months of the current year, against 30,657 tons in 1915 and 21,550 tons in 1914. This constitutes a record export from the Federated Malay States, eclipsing the previous month's export (which was also a record) by 594 tons. The following are the comparative figures:

	1914.	1915.	1916.
January	2,542	3,473	4,471
February	2,364	3,411	5,207
March	2,418	3,418	4,429
April	2,151	2,777	3,914
May	2,069	2,708	3,956
June	2,306	3,403	5,114
July	2,971	3,687	5,053
August	1,850	3,796	5,782
September	2,879	3,984	6,376
Totals	21,550	30,657	44,302

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore gives the figures of the export of plantation rubber from Straits Settlements ports during the month of August as 3,246 tons against 5,106 tons in July and 2,295 tons in the corresponding month last year. This gives a total of 31,964 tons for eight months of the current year against 20,228 tons in 1915 and 11,415 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January	1,181	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,477	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
June	1,480	2,249	3,836
July	1,584	2,324	5,106
August	1,325	2,295	3,246
Totals	11,415	20,228	31,964

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to September 11, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States	10,623,497	17,450,389
Canada and Newfoundland.....	384,940	6,720
France	301,472	1,073,754
Russia	332,200	248,874
Italy	15,680
United Kingdom	16,837,653	14,690,012
Australia	518,937	697,551
India	1,000	728
Straits Settlements	119,933	43,680
Japan	236,251	218,189
Totals	29,355,883	34,445,577

(Same period 1914, 22,948,053 pounds; same period 1913, 16,477,894.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 2,174,979 pounds from the Straits Settlements and 525,213 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

THE MARKET FOR RUBBER SCRAP.

Copyright, 1916.

NEW YORK.

THE rubber scrap market has shown a tendency to gradually work upward in sympathy with the advancing position of crude rubber. The flurry caused by the German submarines along our coasts stiffened prices somewhat, and although the scare was of short duration, it added to the strength of the dealers' position.

The opinion that the reclaimers are doing a good business is supported by reports that the rubber mills are already busy on the regular fall and winter work. That the rubber scrap market will feel the result of this activity before long is the belief of the large dealers who are holding out for better prices, and in fact the small dealers are equally adverse to letting go their holdings at the present ruling prices. Purchases therefore have been usually of small volume and the general business has only been fair for the month and this particular period.

BOOTS AND SHOES.—These have been quiet and more or less unsettled during the month as the mills have not appeared to be greatly interested in the prevailing nominal quotation of 9½ cents delivered. The diversity of opinion as to the available stocks and supplies and the absence of marked activity has failed to establish set prices in this material.

AUTO TIRES.—If anything, the tire situation has developed a certain amount of strength in October. Toward the end of the month, activity was noticed particularly in mixed tires. Offers were made of 6½ cents delivered, and sales at 6¼ delivered were reported. G. & G. tires have been quiet and considered a dealers' proposition. Reclaimers are quoted as saying that at present price of 8½ cents for this grade works out at a loss to them.

INNER TUBES.—The tone of inner tubes has been a little stronger of late due to the rubber position, although activity has been lacking in all grades. Dealers are reported to be carrying comparatively limited stocks and delivered prices have ranged between 75 and 25½ cents.

MECHANICALS.—All grades have been inactive, but the indications for good fall business are encouraging. Hose has been particularly steady and prices throughout the entire list are practically unchanged. London imports of waste and reclaimed rubber for September were 71,100 pounds; Liverpool, 61,500 pounds. Re-exports were: London, 1,800 pounds; Liverpool, 2,400 pounds. The September exports of waste and reclaimed rubber manufactures of the United Kingdom were: London, 539,300 pounds; Liverpool, 191,500 pounds.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1916.

NEW YORK.

THE advance in cotton during the month just passed has recorded figures unprecedented since 1874. January quotations have touched 19.60 cents, practically realizing the prediction of a month ago, of 20 cent cotton, and now the bull side of the market is forecasting 25 cent cotton by January 1. The inclination to discount crop estimates and unfavorable weather reports from India, together with heavy local buying orders, are the prime factors in this movement.

The prevailing abnormal prices of American, as well as Sea Island and Egyptian cotton, would warrant the belief that these levels may not be long sustained, unless supported by a continuance of the unusual conditions now controlling the market.

SEA ISLAND COTTON. There has been an active demand both in the Charleston and Savannah markets, and prices have steadily advanced. By the middle of October it was difficult to buy any quantity at less than 40 cents for round lots. The buying has been general, on account of both Northern and Southern mills, as well as on speculation. On October 20 the crop in sight at all ports was 32,057 bales, against 19,678 bales last year. Fancy Georgias and Floridas were selling at 39½ to 40 cents.

EGYPTIAN COTTON. Mail advices from Alexandria under date of September 19, indicate a very excited market and violent price fluctuations due to lack of selling interest. Climatic conditions have improved and all the Delta districts are now engaged in the first picking, but the results are inferior to last year. The bolls of the second picking appear to have suffered considerably from the pink boll worm and the third picking will undoubtedly suffer from the same cause. Exports from Alexandria from August 1 to September 13, 1916, were 17,623 bales, of which Great Britain imported 13,114; the Continent 3,176; United States 1,133 and India and Japan 200 bales. For the same period last year the total exports were 48,520 bales, of which Great Britain imported 20,364 bales; the Continent 14,383; United States 12,748, and India and Japan 1,025 bales. On October 25, Brown Egyptian cotton was 39 cents and Sakelardides was 46 to 48 cents.

HOSE AND BELTING DUCK. The demand has been active in a firm market and prices have advanced 5 to 6 cents a pound during the month. The mills are sold into May and July next year, and are making regular deliveries on contracts. The labor situation is not so acute as with the northern mills and strikes have not seriously interfered with production.

SHEETINGS, OSNABURGS, ENAMELING DUCK AND DRILLS. Steady buying during the month resulted in rapidly advancing prices that show gains of 2 to 4 cents over quotations published a month ago. Sheetings that normally sell for 4½ cents are now selling for 9½ cents. The demand is of domestic origin and apparently devoid of speculative features. Under the present cotton market conditions, there is small prospect of lower prices.

TIRE FABRICS. The situation at present, concerning both buyer and seller, may be described as chaotic. While most of the largest consumers are protected by contracts, there are many buyers who are unable to secure necessary supplies, or definite assurances for the future. The seller is confronted with abnormal prices for raw material, moreover, a 25 per cent shrinkage in the production of tire fabrics is reported. The fabric mills are now confronted with trouble in obtaining sufficient yarn for their requirements and the difficulties surrounding the labor situation are rather worse than better.

Sea Island building fabric has advanced 5 to 10 cents the square yard, and Egyptians have gone up 15 to 20 cents. Sixteen months ago tire fabric was selling for 16 cents, to-day the same material is around 80 cents. The result will be greater demand for Peeler fabrics and increased sales of unguaranteed tires.

THE MARKET FOR CHEMICALS AND COMPOUND-INGREDIENTS.

Copyright, 1916.

NEW YORK.

CONSIDERABLE activity has characterized the rubber chemical market during October. Inquiry has been good and the demand quite up to normal, while prices, with a few exceptions, have undergone but little change since a month ago. The mills are now looking to their forward requirements and contracts are being written covering supplies for 1917.

ANTIMONY SULPHURET. There has been a steady demand for both crimson and golden antimony. Prices have remained practically the same as a month ago.

BARYTES. The demand has been good for all grades, with prices ruling at about the same level as last month. Export demand is reported to be increasing, which is confirmed by recent over-sea shipments. Foreign grades were comparatively scarce.

LITHARGE. This pigment has had a steady demand, due to the mills coming into the market for supplies. New contracts are being written and deliveries on old accounts are promptly called for. The firm prices ruling have been due to the steady position of the metal market.

LITHOPONE. The market for this material has been quiet but later in the month offers were freely made on spot and forward positions. Prices are about the same as a month ago. Contracts covering next year's requirements are now being placed.

ZINC OXIDE. The demand has increased and there is a steady call for deliveries on contracts. The producers are disposing of their output through contracts only, and the consuming trade is obliged to cover its requirements in this way. The new prices which went into effect October 1, cover a period of three months, so there will be no change until the first of the year.

DRY COLORS. Trade has been good, especially in red oxides, due to the tire demand that is at present extraordinary. Ultramarine blue has been well sold up, but recently supplies appear to be easier.

WHITING. The consumption of whiting continues steadily, with prices unchanged and firm. The difficulties in securing supplies of the raw material have greatly increased the cost of production, which accounts for the present steady price levels.

TABLE OF CONTENTS ON LAST PAGE OF READING.**A RUBBER SYMPOSIUM.**

THE Rubber Club dinner is slated for the evening of January 8. On the afternoon of that day there is to be held at the Waldorf a function that bids fair to rival the banquet in trade interest. It is to be a symposium on the pregnant subject of crude rubber. The dominant note will be a discussion of ways and means for assuring to American manufacturers a continuous and controllable supply of this most vital of raw materials. Experts on the subject of wild and plantation rubber, on ocean transportation and kindred subjects will speak. Discussion of these subjects will be open, not only to members of the Rubber Club, but to visitors who are interested. Cards of admission will be issued to those who apply to the secretary of the club. The committee in charge consists of H. Stuart Hotchkiss, William E. Bruyn, and the Editor of THE INDIA RUBBER WORLD.

THE ADVANCE OF THE AMERICAN CHEMICAL INDUSTRY.

MUCH has been heard of late years about the wonderful accomplishments of German chemists. As an object-lesson it has been beneficial, but, unfortunately, there are pessimists who assume that chemical America is standing still. They agree that America showed the way in electricity, in machinery and machine tools, and to-day stands first in methods of efficiency, but they do not know that the United States bids fair to become the world's chemical leader.

The preliminary statement of the Bureau of the Census for American chemical industries, by five-year periods since 1899, shows that the number of establishments increased from 1,785 to 2,461, and the capital invested, from \$238,471,290 to a total of \$722,988,871 in 1914. The value of the products during these three periods covering 15 years leaped from \$202,506,076 to \$547,801,937, or 170.5 per cent. Correspondingly there was also a gain of 37.5 per cent in persons engaged and of 144.1 per cent in salaries paid.

The war has stimulated the chemical industry tremendously, and the longer it continues the greater will be the growth. Europe, and indeed America, is awakening to the fact that American chemists already mean to American industry what German chemists have meant to German industry. And it can be said truthfully that industrial chemists in the United States are to-day the equal of any in the world. For years every great manufacturing establishment has had a research laboratory where a corps of skilled chemists worked systematically toward wider knowledge, improved methods and higher standards of efficiency in the product. Germany was not unique in this respect; the chief difference has been that we have taken it as a matter of course and failed to give it proper publicity. Another handicap has been the secrecy and isolation attending much of the chemical investigation of the past; the keen commercial rivalry, characteristic of America, has to an unfortunate extent discouraged comparison of results and coördination of research for the common good.

A step in advance was taken, however, when the chemists of the American rubber trade discussed aging tests at their recent meeting in New York. Not specifically as to the subject chosen, but rather because it showed the absolute willingness of those in charge of some of the biggest and best equipped rubber laboratories to discuss questions of general interest fully and frankly. The key-

note was struck by Dr. Geer when he stated that any problem that affected the customer's interest ought to be regarded as a matter that all could and should debate fully. That there are scores of such questions goes without saying, and that their presentation before a congress of alert, practical, working rubber chemists would result in anything other than great general good is incontrovertible. The rubber chemists have made an excellent beginning. They owe it to themselves and to the trade to go on.

GUAYULE IN THE SOUTHWEST.

RUBBER planting in the United States is in sight at last—at least it looks so. The profitable cultivation of guayule, which had its beginnings with the researches of Professor Francis Lloyd, seems assured. This will mean much to the owners of vast tracts of waste land in the South and West. It promises also to bring into use thousands of acres of irrigated lands once fertile but now exhausted as far as ordinary crops go. It will also be of the greatest value to the American rubber trade, an anchor to the windward, and a practical piece of preparedness.

Para rubber once came only from Brazil. Labor conditions, costly freights, and high taxes started the great Para plantations in the Far East. English enterprise, capital and organization did all this. Guayule rubber is or was an exclusive Mexican product. War, confiscation, banditry, are giving an impetus to guayule planting in the United States. Is it not possible that American enterprise, capital and organization will do for the United States what England did for the British Empire, and that rubber may some day be produced on a large scale under the stars and stripes?

TWENTY MILLION TIRES FOR 1917.

A CONSERVATIVE estimate of next season's tire demands indicates a tremendous increase. Motor cars for both business and pleasure are in greater demand than ever. Most manufacturers are everywhere making new sales records, and the increased interest being shown by the agricultural population is particularly significant. The buying power of the 6,000,000 farm owners of the country promises to become an important factor in the sale of moderate priced cars, for while the wheat yield is below normal, other crops are not far from

their best. Indeed, P. J. Calhoun, general sales agent of the Quaker City Rubber Co., who has just returned from the West where he has been compiling statistics regarding the growth of the automobile business, reports that the sale of cars in the Middle West is unprecedented, and that 75 per cent of the cars sold this year has been disposed of in agricultural states. Indiana sales have been double those of 1914; 10,000 cars were sold in Kansas in less than six months. In the three states of Iowa, California and Nebraska the ratio of motor car owners to total population is 1 in 21, 1 in 23, and 1 in 25, respectively; this means that one family in every five or six has a car.

These facts are of great interest as forecasting the probable 1917 tire demand. 1,500,000 new cars will require 6,000,000 tires for original equipment, and as about two-thirds of all motorists carry at least one spare, 1,000,000 more may be counted in. According to the National Automobile Chamber of Commerce 9,000,000 tires were discarded last year. As this represents the tire wear of about 3,400,000 cars, the 1917 replacements on 4,900,000 cars according to the same ratio will reach 12,970,300, which, added to the 7,000,000 already accounted for, makes the colossal grand total of 19,970,300.

THE BRITISH CHEW GUM.

THERE has been in times past a certain polite distress on the part of the cultured European over the American chewing gum habit. To him it was vulgar and offensive, and that it would ever become a British habit, for example, was not to be imagined. Nevertheless, Britons, French and Italians at the front have become devotees of the habit, and civilians are also following their lead. Perhaps it is a pity and perhaps not. Gum chewing is in the abstract no more offensive to non-chewers than is smoking to non-smokers. Moreover, it is a comfort in time of stress, and an aid to digestion. It is affirmed that the Yankee nasal tone has been agreeably modified by this habit. It is also claimed that its effect upon floating aspirates is beneficial. Thus, if a Cockney takes up the habit, instead of dropping an H, the plastic cud holds it firmly in its place, and his English is perfect—so it is said.

RUBBER HAS OFTEN BEEN TERMED A LUXURY. THE sufficient evidence that it is a necessity is found in the fact that less than a month ago Para rubber sold in Berlin at \$22.50 a pound.

Proceedings of the "Rubber Section"—Continued.

Two important addresses delivered before the Rubber Section of the American Chemical Society during the September, 1916, Convention were printed in the October issue, followed by three other interesting papers in the November issue. Below is given a summary of the symposium on "The Accelerated Life Test of Rubber Goods," in which some 20 rubber chemists participated, including Dr. W. C. Geer, C. R. Boggs, D. W. Whipple, J. B. Tuttle, P. L. Wormeley, Dr. L. E. Weber and Messrs. Postmontier, Clark, Barrier, Thompson, Pierce, Kimley, Burns, Potts and Saunders.

DR. L. E. WEBER presided, and in introducing Dr. Geer, stated that he was probably the first man in this country to put an accelerated age test to practical use. He emphasized the paramount importance of aging tests for manufactured goods despite the fact that chemists have been carrying out accelerated tests in various ways and with various results, so that whereas some consider them of inestimable value, others claim that no satisfactory accelerated test has yet been devised.

Dr. Geer then spoke briefly regarding his methods, as follows:

The first work done in the laboratories of The B. F. Goodrich Co. on accelerated age tests was in the fall of 1907, at which time a suggestion came to us from Dr. Van der Linde, of the Gutta Percha & Rubber Co., at Toronto, who used a very fast aging

found the tensile curve of which falls off more rapidly than that of another compound of the same type will deteriorate more slowly on standing over a period of months or years under room conditions. We now have the results of ordinary aging tests plotted in months, in comparison with the accelerated aging tests plotted in days for the same compound, cured under the same conditions, and we find them quite similar in form.

But compounds differ. There are so many factors entering into compounds that a great deal of judgment is required. Several types of tensile curves have been stated.

The method is of no great value in the lower classes of compounds. It is more valuable in the higher classes; for instance, in such types and compounds as fire hose and articles of that kind. It is a service test designed for compounds that are stored as part of their service. The accelerated aging test is not reliable when applied to compounds designed for special purposes and it

W. C. GEER.

D. W. WHIPPLE.

C. R. BOGGS.

test. He performed it upon three small pieces of rubber. The samples to be tested were put in an air bath and heated at about 140 degrees C. for a period of 1, 2 and 3 hours, taken out and examined for cracking, hardening or to ascertain whether it was becoming soft. This method was not parallel with actual aging in any particular and we came to the following: Into an oven, heated air was blown at a temperature of 160 degrees F., the chief care being to add hot fresh air during the desired time. A number of samples 3/32 of an inch in thickness were previously cut and put into this air bath. The air was then started circulating and the test was continued for a period of two weeks, taking out three samples each day. These were allowed to stand for 24 hours until they reached a state of equilibrium, after which they were tested for tensile strength and elongation. The data were plotted in curve form and gave us a time-decay curve of the compound. It is worth while to emphasize the point that we consider this purely a practical, not an ultimate test. It was always run in comparison with a standard compound; that is, at least two sets of samples were tested at the same time. By comparing, then, the curve of a compound the age of which we knew, and the curve of a compound the age of which we did not know, we could tell whether the article would age properly in service.

We have run many thousands of these curves and this method of determining the aging test is reliable, although it undoubtedly can be greatly improved. We find, for instance, that a com-

is very questionable whether it is at all valuable as a specification test to be applied by the consumer. Its primary value lies in the fact that it is an aid to the compounder in the manufacturing plant to permit him to study the aging of compounds the materials of which he knows. It might be used by consumers as mentioned above for compounds such as fire hose where storage under ordinary conditions plays a large part and where it is necessary that the compound be soft and flexible throughout its life.

These remarks I realize are very incomplete, for it has been impossible for me to find time to write a paper on this subject. My primary purpose in speaking before this meeting is to suggest for your earnest consideration the study of accelerated aging tests in order that it may be possible for the rubber manufacturer to give to the consumer compositions of certain age and thus tend to eliminate from the rubber business the perishable features of rubber compounds.

In answer to questions, during the discussion which followed, Dr. Geer stated that his tests were carried out under air conditions and in the dark. His samples were put in a drawer separated by a sheet of cardboard, and the temperatures given were varying to a certain extent, although the temperature of the room did not ordinarily exceed 95 degrees in summer and never became very cold in winter, as there was continuous heat. Thus the aging tests ran parallel with a reasonable varying de-

gree. Although both an under and an over-cured sample can be tested, an under-cured sample, he said, does not pass the test. The temperature of the oven is a factor.

Later, during the discussion relative to insulated wire, particularly in regard to compounds containing a large amount of accelerator, he expressed the opinion that the temperature of an accelerated aging test would make no difference in the physical results obtained. This is limited by reducing the total amount of sulphur when accelerator is used. By "type of compound" he explained that he meant compositions in relation to tensile strength and physical quality. This life test will show whether the product is going to stand up or not. It is a practical service test to accelerate the conditions which the compounds would have in ordinary use, not compounds subjected to very bright light, nor for articles to be subjected to a great deal of steam.

Regarding a suggestion that the permanent elongation of steam hose may be caused by the cold flow of the water which follows the hot injection of steam while exposed to daylight, Dr. Geer said that, bearing in mind that permanent elongation is dependent somewhat upon tensile, it will be found that after three days of elongation the tensile will have fallen off. If the ratio of the tensile and elongation could be worked out it would indicate what the limit ought to be.

C. R. Boggs then discussed a series of experiments begun seven years ago to determine the value of the various short life tests which had been proposed up to that time:

These tests included various dry heat and steam tests and what is known as the acetone peroxide test. On none of the tests tried did we obtain results which were at all promising. Acetone peroxide certainly does not oxidize rubber in the same manner as air does under ordinary conditions. We then imported a quartz tube mercury vapor light in the hope that the ultra-violet light might cause the natural oxidation, but at a greater speed. Oxidation does take place rapidly, but it is similar to that obtained on a sunracking test rather than that obtained by the natural aging of rubber. The ultra-violet light, therefore, might be used as a standard light for a sunracking test, but not for a life test, as the two tests are not similar by any means.

We had had so many disappointments that when we heard of Dr. Geer's heat test we practically refused to try it. Later, however, we did try it and the results were sufficiently promising so that about three or four years ago we made a comparatively thorough study of it. As we have tested samples regularly which have been exposed to the light and air of an ordinary room after regular intervals of time over the entire life of the samples, we knew what the life of our samples should be and consequently it did not take long to find out that the test was very valuable. We have used the test since then. Duplicate samples of those tested by the Geer test, when kept and tested after ordinary deterioration, showed the same characteristics in practically every case. Samples which, by the Geer test, had shown decrease in tensile but not in ultimate elongation, showed the same thing after natural aging. Other samples which maintained their tensile but decreased in elongation, and still others which increased in tensile, all showed the same results by the two tests. The time in days that corresponds with a certain number of hours of the Geer test varies with different grades of compounds, but does not seriously detract from the value of the test.

There are at present many specifications which call for a definite compound of certain chemical and physical characteristics which are based on the assumption that there exists no reliable short life test and that, therefore, the next best insurance is to demand something which has been known to have had a satisfactory life. When the purchaser has taken this position we have assisted him in trying to see that he obtained what he specified. However, if we have a satisfactory short life test in Dr. Geer's heat test, it would be much better for both the purchaser and manufacturer to use this test. The purchaser would be insured of a permanent compound and the manufacturer allowed to use his ingenuity to advance the art of the trade. It is now time for the purchaser to satisfy himself that the test is what it is claimed to be.

Up to the present time, I have not found any samples which were not correctly represented by the Geer test, but I have lately heard of a compound with an organic accelerator which was said to pass the test, but which did not stand up on natural aging. I am now trying to duplicate this result.

Mr. Boggs later expressed himself of the opinion that the

value of the test might increase upon further investigation, adding that most compounds tested by the rapid aging method contained an increased amount of accelerator, and that while successful results are the rule, care must be taken particularly to avoid over-curing.

Mr. Whipple's address carried the discussion a step farther than that of Dr. Geer:

Among the interesting points brought out by Dr. Geer, his discussion of the nature of curves obtained and their interpretation brings to my attention one type of curve which he has omitted, namely, one with an upward tendency from the beginning of the test and not falling below its starting point during the period of the test. Such a curve has been obtained in three instances on tests conducted for Committee D 11. I have not seen the results of the other members of this committee, but if they are in agreement with mine and the curves obtained were to be interpreted in a broad way as indicating service value, it brings out the interesting conclusion that the general run of the code wire is better than the general run of the 30 and 40 per cent grades on the market to-day, as the code wires consistently gave this upward curve.

One test, for instance, showed 102, 106 and 108 per cent, respectively, after 12, 24 and 48 hours' exposure to the test, and at the end of the hours the curve had dropped to its starting point of 100 per cent and did not fall below this after 144 hours, at which time the test was discontinued, whereas three of the 30 per cent wires after 144 hours had fallen to 56, 58 and 58 per cent, respectively.

We have, of course, tried out this aging test on samples of known life, starting with a knowledge of most of the conditions under which the original compounds were made and vulcanized, and although the conditions may not have been exactly the same, the results should have been more nearly comparable, as in the accelerated test the curve was a decreasing one from the beginning and in the actual life test there was a decided increase from the beginning, and at the end of ten years the value was 150 per cent of the original.

Other compounds on which we have a better check have shown in a year and a half an increase from 1,200 to 1,800 pounds tensile strength and at the end of three years were still 1,800 pounds or above, representing an increase to 150 per cent, whereas in the accelerated tests these have shown a downward curve from the beginning.

I am decidedly of the opinion that this accelerated test is of value to the manufacturer in determining the best time and temperature to be used in vulcanizing compounds of the same general type, and I am also of the opinion that it is of great value to the manufacturer in passing judgment on the relative value of many of the ingredients used in rubber compounding, and while not prepared to state any relative values, I am quite sure that after further experiments we shall be able to arrive at an interpretation of results which will be of value to the consumer as well as to the manufacturer.

Referring to Mr. Tuttle's description of tests after which the tensile strength of the articles had fallen down, Mr. Whipple said:

We had some cable made in 1906 which was furnished to the government, and was stored under water at Fort Wadsworth. There were about ten reels, one mile each, and those ten reels continually went down on the electrical test. Now, after nearly ten years, they are entirely defective electrically. The tensile strength of the insulation is over 1,800 pounds and the elongation over 12 inches after ten years. You cannot find an apparent mechanical defect anywhere; they are simply water-logged. This experience is just the opposite of the one mentioned by Mr. Tuttle, but it also shows that both methods of testing must be considered.

P. L. Wormeley then spoke of the work being done at the Bureau of Standards along the lines of Dr. Geer's investigations:

I have been conducting the test which has just been described for something over four years, and would say that in a general way the diagrams which Dr. Geer has put on the board illustrate very well the results obtained at the Bureau of Standards. Our first tests were made with 12 compounds furnished by Dr. Geer and in some cases sufficient time has not elapsed to show their life under normal aging conditions. The results that we have obtained would indicate that the effect of dry heat at 160 degrees F. on the physical properties of rubber compounds is indicative of the probable life; but these results have not exhibited any definite relation between the effect of the heat test and the effect of aging under normal atmospheric conditions. When our tests

have gone a couple of years longer and we can plot the curves, it is possible that some relation can be shown.

Mr. Wormeley also touched upon the effect of under-vulcanization upon the results of the accelerated heat test:

We have had some experience along this line in testing the 12 compounds already referred to as having been furnished by Dr. Geer. Each of these compounds was represented by three cures, one supposed to be the correct cure, one under-vulcanized and one over-vulcanized. In plotting the effect of heat on tensile strength and on elongation, three distinct curves were usually obtained for each compound, the under-vulcanization being represented by the top curve, the correct vulcanization by the middle curve, and the over-vulcanization by the bottom curve. In the case of the lower grade compounds, particularly those containing shoddy, there was not much difference in the effect produced by the different degrees of vulcanization.

J. B. Tuttle followed, emphasizing the desirability of supplementary chemical tests:

All of those who have so far taken part in this discussion have been using mechanical tests, such as tensile strength and elongation, as a measure of the rate of deterioration during aging. For some four or five years, I have been making some tests on the aging of rubber bands, by determining the amount of organic acetone-soluble matter. These tests are still unfinished, but as far as I have gone, the results are significant. Samples having an initial acetone extract of, say, 7 per cent or more, show a rapid increase by the end of the first year. Those with 5 per cent show very little change for a year or two, but increase rapidly after that time. Samples with 4 per cent or less show practically no increase in four years, and I cannot say just now what will happen to them during the next year. As far as their usefulness is concerned, the 7 per cent bands are worthless at the end of a year, and the 5 per cent bands in about three years.

In considering these facts, it occurred to me that if we could duplicate the conditions in a rapid test, then the chemical tests would provide us with an excellent method for checking up the results obtained by means of the mechanical tests. I have made a few attempts along this line, but I have not yet been able to duplicate the causes I have indicated here. It may be that, given the correct temperature and length of time of heating, we would be able to form a fairly accurate estimate of the probable life of the compound.

I tried exposing samples to direct sunlight, and while the results showed some promise, the time required was six weeks or more, and, of course, is out of the question.

So far as heating is concerned, the tests have not shown the degree of difference in behavior of the 4, 5 and 7 per cent compounds that I would like to see, but I believe that if this problem could be satisfactorily worked out, it would be of great value in checking the results obtained by means of the mechanical tests, and thus be more certain that we are getting a good compound.

An especially illuminating instance was cited to emphasize the mistake of placing too much reliance on any one test. Said Mr. Tuttle:

We tested a shipment of rubber gloves intended for the Panama Canal. Every glove was tested and found to be satisfactory, yet within six months of the time after they had been shipped to the Canal, and placed in storage there, they were found to be in a defective condition. Some of these were returned for examination and further test. These gloves stood about 10,000 volts on the break down test, but if you took one of them and simply bent it once, it cracked all the way across. The tests of strength and elongation are the important ones here. The gloves were all right electrically as long as they were not in use.

I have had similar experience with insulated wire. A few days ago I was testing some wire which had been in service only a few years. The electrical properties were satisfactory enough, but the insulation had hardened so that if the wire was bent, the insulation cracked.

The point which I wish to bring out here is this: In making these accelerated life tests, it is not sufficient to rely on one method of testing only; if we are testing rubber insulation, we must make the mechanical tests as well as the electrical tests, and I am not at all certain that the time may not come when we shall add a chemical aging test as well.

Mr. Postmontier's remarks were directed to the possibilities of an accelerated aging test and included valuable suggestions for definite organization of the work:

I am not in a position to make very many experiments of this kind and I suppose that the rubber manufacturing labor-

atories have neither the facilities nor the time; but it has struck me that there is a possibility of a great amount of very important and useful work that could be done by this Rubber Section. There is always a difference between the rubber chemist and the consumer as to the proper specification for rubber materials, and it has occurred to more than one rubber chemist that many times the specifications are drawn to a poorer grade of material or a more expensive grade of material than the consumer might use. On fillers and on rubber content which are called for in different materials, we find a defect in many as to the best materials. The consumer is always after the best material possible, but does not always know how to get it. The majority of rubber manufacturers, being honest, are eager to give the consumer the best material they can; and it seems to me that a coördination of rubber chemists in a section like this can do very good work in determining what are the best materials for the rubber compounds for different purposes. We experiment with a very large amount of compounding material and a large number of different kinds of rubber. It would be almost impossible for any rubber laboratory, even the laboratory of a very large manufacturing concern, to do the necessary work in examining the different features involved. There would always be the element of difference as to the method of tests and liability of result.

There should be a committee appointed by the Rubber Section, first of all, to standardize an accelerator test. It is a very good test—probably no better test can be found—but at the same time there are errors that may be introduced: A faster or a slower current of air; questions as to the uniform temperature, and so on; questions on the heating principle might be brought out. Standardized compounds might be suggested and different laboratories that are willing to enter the work designated to determine the effect of two or three more compounds. Gradually the whole field of different compounds and rubbers could be investigated and a great deal of important work accomplished by this kind of coördination.

E. A. Barrier believes that aging tests are not yet sufficiently conclusive to be of great value to the consumer:

I am quite sure that every consumer arranges to get all of the cooperation he can from the manufacturer; but it seems to me that this aging test is apparently not yet in a position where it will be of very much value to the consumer. It is very evident that there is no definite conclusion as to the normal life of rubber in the aging test. What the consumer wants is a test that he can actually see; and if the sample shows up well in a few days he wants to know that it will last two or three years. In the accelerated aging test a sample may show good results in ten days and the ten-day sample may last a shorter time in service than the three-day sample. It is of value to the manufacturer, but of no value to the consumer. Thirty per cent is a very wide classification and also one that does not directly answer the argument—that these accelerating tests show we have had very little information as to the actual service condition. For instance, this new specification which was discussed this morning confines that to a type. Therefore, the consumer of insulated wire under that specification could use this test, due to the fact that a manufacturer is limited in his specific gravity, and for commercial reasons, he has to bid as low as the next man, and if he follows the specifications he will have the same compound, or practically so.

While not a chemist, Mr. Pierce expressed himself as particularly interested in the subject of accelerated tests and hopeful of an ultimate result. Said he:

The consumer is not primarily interested in how strong the wire is or anything else of that sort which you, as chemists, are always working on, but the consumer is interested in knowing whether that wire is going to be electrically insulated after one or ten years. It occurs to me that if the work on this accelerated test is to be continued and elaborated, it might be profitable to learn whether the insulation shows good electrical properties after this accelerated test, because that is the result you are after. This is done now by chemical tests or mechanical tests, and if it were possible to add to such accelerated tests, tests of electrical properties, the insulation arrived at, etc., the results would mean more to the consumer, and he would be able to grasp it more readily. What the consumer is interested in, in the case of wire, is the question of its electrical properties.

Mr. Kimley then raised a point regarding the aging effect of light:

It occurs to me that perhaps the actual life of rubber is influenced by light conditions. If it were standardized under the

same conditions of light as the articles will be subjected to in actual use, it would disclose a result; for instance, the cover on a hose. On the under side of the hose, the tensile there will deteriorate very slowly while the upper side, against the light and against the building, will deteriorate rapidly, and it must be the condition of light which causes this effect. I think this accelerated age test must be a good thing for the consumer.

Dr. Weber reported that he has found a simple method of accelerated aging highly satisfactory, and described it as follows:

I have carried out in the past five or six years a large number of these accelerated aging tests and while my method of procedure is not the highly scientific one which Dr. Geer has outlined, the results obtained have been so satisfactory that I have come to have great faith in the test.

My method of procedure is to subject the sample in question to a temperature of 65 degrees C. for a period of two weeks. A sample of approximately the same composition and of known aging qualities is subjected to the heat treatment together with the unknown sample. At the end of two weeks the two samples in question are compared and from their relative condition very accurate conclusions regarding the aging properties of the unknown sample can be drawn. It is highly important that the sample of known aging properties have a composition similar to the unknown sample, for it is very readily observed that the higher the rubber content the more violent is the action of the heat.

There are other precautions to be observed if misleading interpretations are to be avoided. If the unknown sample is under-cured, and at the same time contains considerable free sulphur, I have found that unreliable results are obtained. On the other hand, if the sample in question is at all over-cured, the heat treatment shows this up in a very pronounced manner.

I would rather feel that the contradictory results which have been obtained in the accelerated aging test are largely due to the fact that the action of the heat is materially influenced by the nature of the compound and that the latter must be taken into very careful consideration in the interpretation of the results and general conclusions that are drawn. On the other hand, when this factor is taken into careful consideration, very accurate and reliable predictions can be made.

Later, during a discussion regarding free sulphur in vulcanized products, Dr. Weber stated that personally he could see no objection to it in an article properly vulcanized, and he questioned if it were an accepted fact that free sulphur is bad for rubber.

Mr. Potts, in concluding the discussion, made the following important suggestion:

It occurs to me that if we try to get a test to indicate what kind of service the sample will give, a compound which has very little free sulphur will show very little service and the accelerated test will confirm that service. If there be a large amount of free sulphur, then free sulphur in actual service may not have a great effect on the material; but at 65 or 70 degrees, the accelerated test may indicate a shorter service than we actually get in use.

PRODUCTION OF SOAPSTONE AND TALC.

In the production of soapstone the United States ranks first among all countries, and Virginia produces about twenty times as much as the four other producing States—Maryland, North Carolina, Rhode Island and Vermont.

The production of soapstone and talc in the United States is steadily increasing, according to the United States Geological Survey, Department of the Interior. In 1900 it was 27,913 short tons, in 1910 it was 150,716 tons, and in 1915 it was 186,891 short tons.

DUSTLESS LAMPBLACK.

The disagreeable features that invariably attend the use of lampblack or carbon black are plainly evident in the compounding room and around the mixing mills. Pressed lampblack has been used for a long time, but even that is in a more or less powdery condition and only furnishes a partial relief from the flying dust. Carbon black, now used extensively by tire manufacturers, is of a more powdery consistency than lampblack and therefore is subjected to greater pressure, a remedy that is only a partial cure.

Dustless lampblack may be made by mixing 60 per cent of lampblack with 40 per cent of petroleum or palm oil. The resultant compound is a substance that has the consistency of lard or soft butter and may be compounded and milled with perfect cleanliness. The name "Petroblack" is obviously fitting for the former and "Palmoblack" for the latter.

HEATING APPARATUS FOR EXTRACTORS.

D. REPONY, assistant chemist in an important American rubber factory, is the inventor of the interesting apparatus described below.

As a preliminary, it is not necessary to dwell upon troubles attending extraction apparatus heated with open steam. Moreover, while electric plates are clean they are not ideal, as they get out of order easily, the danger of fire is always present and the cost of operating is quite high.

It is claimed that the apparatus illustrated here has taken care of all the objections present in the other types, is simple and cheap to operate and when once installed will last a long time.

It is heated by steam under such conditions that not a trace can escape from the heating casting. This heater is a hollow

A—Heater. B—Steam Inlet. C—Steam Exhaust. D—Extraction Containers. E—Adjusting Screws. F—Water Supply Pipe. G—Waste Pipe.

one-piece brass casting supported by three standards and adapted to be placed on a bench or table. The eight holes to accommodate as many extractors are cored out of the casting at the top, with jackets to prevent direct steam contact. Eight hand screws, supported underneath the heater, are used to raise or lower the extraction containers in the jacketed holes, so that solvents of different boiling points may be run in adjacent containers and the quantitative amount of solvent in circulation regulated. The heater is sufficiently strong so that steam under pressure may be used when it is necessary to use solvents with a high boiling point; however, with solvents up to and including alcohol, the free circulation is sufficient. Steam is admitted at the right end and exhausted through a pipe at the left end of the heater where a steam gage is located to record the pressure.

The extraction containers are common 1½-inch test tubes which fit snugly into the jacketed holes. The condensers are of block tin and the tubes closed by covers of the same metal. Rubber tubing connects the condensers with the water supply and waste pipe, and galvanized cups attached to the frame back of the brass heater afford convenient receptacles in which to place the containers after removal from the heater. This has been found very convenient when extractions are run for a definite time and especially when the removal is left to the night watchman.

What the Rubber Chemists Are Doing.

SYNTHETIC CAOUTCHOUC.

THE researches on the chemical constitution of caoutchouc and the sources and processes available for its synthesis, have been outlined by B. D. W. Luff in the "Journal of the Society of Chemical Industry" (October 16, 1916). The author's paper may be summarized as follows:

Between 1835 and 1840 the study of caoutchouc was undertaken on scientific lines by various investigators, including Dalton, Liebig, Himly, A. Bouchardat, and Gregory, but in all cases their work was more or less disjointed. The most systematic attempt to isolate and examine the various products present in the crude distillate from caoutchouc was made by Greville Williams in 1860. He obtained (1) a liquid boiling at 37 degrees C. to which he gave the name "Isoprene"; (2) a large proportion of a hydrocarbon boiling at 170 to 173 degrees C. which was identical with a body previously obtained by Himly, and called caoutchoucine—this has since been proved to be dipentene; (3) a fraction boiling above 300 degrees C. to which he gave the name "Heveene."

Gustave Bouchardat in 1879 undertook a detailed investigation of isoprene, in the course of which he examined the action of hydrochloric acid; he noted that an additional product was formed, but under certain conditions the action of the acid resulted in the formation of a solid mass, not containing chlorine, but having, in fact, the same percentage composition as isoprene itself. He described this body thus: "It possesses the elasticity and other properties of rubber itself. It is insoluble in alcohol, swells in ether and also in carbon bisulphide, in which it dissolves after the fashion of natural rubber." He also noted that on distillation it yielded the same hydrocarbons as in the case of the natural product. This was an important step in the synthesis of caoutchouc; in fact, in order to make this complete, all that was necessary was to prepare isoprene from elementary materials. At that time the only source of isoprene was rubber itself.

Bouchardat's results were confirmed in 1882 by Tilden who observed the polymerization of isoprene. In discussing isoprene he remarked that one of its chief characteristics was its conversion into true caoutchouc when brought in contact with certain chemical reagents. He pointed out that this was of great practical interest as, if isoprene could be obtained from some other and more accessible source, the synthetical production of rubber could be accomplished. Two years later he succeeded in obtaining isoprene by passing the vapors of turpentine through a hot tube.

The outcome of the work of these two investigators was that the caoutchouc molecule was shown to be formed by the union of a number of molecules of isoprene, and this union or polymerization could be brought about by treating the isoprene with suitable reagents. To them must be given the major share of the credit for laying the foundation of the numerous processes since suggested for preparing synthetic rubber.

In 1887 Wallach observed that isoprene undergoes polymerization on exposure to light with production of a rubber-like mass. In 1892 Tilden showed that the material obtained in this manner could be vulcanized with sulphur. The synthesis of isoprene, and as a corollary, that of caoutchouc, was accomplished by Euler in 1897.

In 1909, owing to the rapid rise in the price of rubber, the problem was taken up in England in a systematic manner by Perkin, Fernbach, Weizmann and Mathews and in Germany by the Bayer and Badische companies. In 1884 Tilden suggested that not only isoprene, but its homologues should be capable of polymerization in a similar manner. This was found to be the case, and these bodies, chief among them butadiene, form the basis of methods for obtaining synthetic caoutchoucs.

Among the materials available as starting points for suggested syntheses are coal tar; the low-boiling fractions obtained in petroleum distillation; starch and cellulose. On account of the colloidal nature of caoutchouc the question whether or not the synthetic caoutchouc-like bodies can be regarded as true caoutchouc cannot be settled by determining such physical characteristics as would serve to identify a crystalline solid such as camphor.

Harries holds the view that caoutchouc obtained from isoprene with the aid of acetic acid is identical with that occurring in nature. This view is dissented from by Stemmig. The synthetic caoutchouc obtained by polymerization of isoprene in the presence of sodium, however, is not identical with the natural product. In view of the rapid advance in the cultivation of rubber it is generally assumed that unless a synthetic product can be marketed at about 30 cents per pound there is little hope of the natural material being superseded.

METHODS OF ANALYSIS.

TESTING ANILINE OIL.

PURE aniline boils at 360.5 degrees F. and at this temperature 95 per cent of the sample should distil. A common method of testing it is with the apparatus shown in the illustration. It

consists of a ring stand *A* and a piece of wire gauze to support the flask; a Bunsen burner *B*; several 200 cc. Lunge distillation flasks *C*; a thermometer *D*; a funnel for filling the flask; an 18 or 20-inch condenser *E*, and a 100 cc. measuring cylinder *F*.

To make the test, 100 cc. of aniline oil are put into the flask by means of the funnel; the apparatus is assembled as in the illustration, and a flow of water connected from the tap to the condenser. The contents of the flask are gently heated until 360.5 degrees F. is reached, at which temperature it is maintained. The volume of oil collected in the cylinder is the measure of the purity of the aniline.

CHEMICAL PATENTS.

THE UNITED STATES.

VULCANIZING PROCESS. Treating rubber for vulcanization by adding vulcanizing material containing lead and sulphur and a reactive substance comprising a metal and an acid radical adapted to form, with the sulphur and lead, respectively, a light-colored water-insoluble sulphide and a light-colored water-insoluble lead salt and vulcanizing the mixture. [Harold R. Murdock, Naugatuck, Connecticut, assignor to Rubber Regenerating Co., a corporation of Indiana. United States patent No. 95,359 (May 4, 1916).]

PURIFYING ISOPRENE. Isoprene is treated with sulphurous acid in presence of hydrochloric acid which serves to facilitate the formation of a crystallizable sulfoxide for the recovery by heat of the pure hydrocarbon. [F. E. Matthews and E. H. Strange. United States patent No. 1,196,256.]

RUBBER COMPOUND. Rubber, dry cork flour, iron slag and gelatinous rawhide, the quantity of rubber in the compound being less than the combined weights of the other ingredients. [Eugene Von Vargyas, Washington, D. C. United States patent No. 1,202,340.]

AGENT FOR TREATING VULCANIZED RUBBER. As a new agent for the treatment of vulcanized rubber, the solution of vulcanized

gum in a solution of resin in a hydrocarbon. [Harry B. Cox, Bedford Hills, N. Y. Assignor to Herman Goldman, New York, N. Y. United States patent No. 1,202,758.]

RUBBER PRODUCT. A product comprising recovered stock replenished with resin, and a material obtained by dissolving vulcanized gum in rubber resin. [Harry B. Cox, Bedford Hills, N. Y. United States patent No. 1,202,759.]

PROCESS OF RECLAIMING RUBBER. A process of recovering rubber stock from vulcanized rubber which consists in treating it with a resin solution together with a solution of vulcanized gum in a resin solution. [Harry B. Cox, Bedford Hills, N. Y. United States patent No. 1,202,760.]

TREATMENT OF FABRICS USED IN CONJUNCTION WITH VULCANIZED RUBBER. According to this process fabric is treated, previous to its incorporation with rubber, with certain reactive materials, in order to protect it against the disintegrating action of sulphurous and sulphuric acids resulting from vulcanization. The materials mentioned as suitable neutralizers include (1) alkalis, such as sodium carbonate; (2) alkaline or basic salts, such as borax or basic lead carbonate; (3) basic oxides or hydroxides, such as lime, baryta, or barium hydroxide; (4) salts of metallic oxides, such as barium carbonate and zinc acetate. [William Edgar Muntz, London, England, United States patent No. 1,203,241.]

SHOE BOTTOM FILLER. Mixture of rosin, Pontianak, and oil solvent thickened with dextrin to a stiff shoe-bottom filler when cold. [Andrew Thoma, Cambridge, Massachusetts, assignor to North American Chemical Co., New York City. United States patent No. 1,203,435.]

SIZING COMPOSITION. Consisting of rosin soap in which is dissolved approximately one per cent. of rubber material. [Judson A. De Cew, Montreal, Canada. United States patent No. 1,203,857.]

TIRE FILLER. A mixture of paste, plaster of paris, chalk, a perfume, alcohol and bismuth subnitrate. [David G. Elder, Chickamauga, Georgia. United States patent No. 1,203,720.]

VULCANIZATION PROCESS. Consisting in mixing wood creosote, partially vulcanized vegetable oils and rubber compound, and subjecting the whole to a vulcanizing heat. [Augustus O. Bourn, Bristol, Rhode Island. United States patent No. 1,203,966.]

NON-INFLAMMABLE WATERPROOFING COMPOSITION. Consisting of a mixture of rubber cement, spirits of turpentine, paraffin wax, gasoline and tetrachloride of carbon, the physical characteristics of which are that it is non-inflammable and waterproof. [James O. Persons, Norfolk, Virginia. United States patent No. 1,204,056.]

CANADA.

RUBBER PRESERVATIVE. Comprising in combination, cocoa butter, castor oil and gasoline in the proportions of two ounces to two quarts, to one quart, respectively, of the ingredients named. [Samuel T. Smith, Blue Island, Illinois, U. S. A. Canadian patent No. 171,630.]

THE UNITED KINGDOM.

VULCANIZATION BY ULTRA-VIOLET RAYS. [H. P. M. A. Oliver. British patent No. 7,823 (1915).]

SUBSTITUTE FOR RUBBER. Mixture of colophony, caoutchouc, sulphur, naphtha and white lead. [R. Castels. British patent No. 7,703 (1915).]

SWITZERLAND.

REGENERATING RUBBER. Fabric containing rubber is treated with tetrachloroethane, with heating, as a solvent for the rubber. [Compagnie Générale des Caoutchoucs de Térébenthine. Swiss patent No. 72,731 (June 16, 1916).]

SWEDEN.

RUBBER SUBSTITUTE. Rubber and egg albumen is molded and cold vulcanized, or after addition of sulphur it is hot vulcanized. [C. Lamberty. Swedish patent No. 40,822 (June 14, 1916).]

LABORATORY APPARATUS.

STORMER VISCOSIMETER.

THE Stormer viscosimeter permits accurate practical work with a small sample of liquid. It is simple in construction; may be quickly and easily cleaned and permits a greater number of tests to be made accurately within a given time than other instruments designed for this purpose. A 50-cc. sample is all that is required for a test.

The instrument is designed upon the principle of rotating a cylinder in the liquid under examination by means of a constant weight and at a known temperature. It consists of a cylinder *B* which may be rotated in a test cup *A*, surrounded by a water or oil bath *C* to maintain the desired temperature. A revolution counter is connected to the spindle supporting the cylinder. The time required for the cylinder to make a specified number of revolutions in distilled water and in the liquid under examination is the measure of the viscosity sought. [Bausch & Lomb Optical Co., Rochester, New York.]

BARNSTEAD AUTOMATIC WATER STILL.

The value of pure distilled water for laboratory and manufacturing operations is universally recognized. The type of automatic still here illustrated and described is heated by gas, steam or electricity and will produce, it is claimed, pure water free of ammonia and all gaseous and organic impurities at a low operating cost. The operation of the still is continuous. The water enters the condenser at the supply pipe and, passing around the condensing tubes, is discharged into an open pipe, allowing the

gases to escape. The water thus purified passes into the still where it is converted into steam, and passing into the condenser is condensed and discharged chemically pure. A continuous stream of water is required for cooling purposes and to supply the boiler that in this particular still is heated by gas. [Eimer & Amend, New York City.]

Guayule Cultivation in the United States.

A RUBBER PREPAREDNESS SUGGESTION.

THERE is a real prospect that the United States may yet become an important rubber producing country. The humid tropical climate essential to the growth of laticiferous rubber bearing trees is lacking, but the silver colored guayule shrub (*Parthenium argentatum*), a member of the aster family, grows wild in many sections of the American Southwest as it does over the central plateau of Mexico. What American enterprise did previous to 1910 in Mexican guayule fields is well known. But the long continued series of revolutions in Mexico reduced the average yearly export of 10,000 tons of guayule rubber to 720 tons in 1914, 2,555 tons in 1915 and 1,408 tons during the 12 months ending June, 1916.

It is not surprising that in 1911 there were 6,000,000 acres of guayule growing wild in Texas alone, because these guayule lands belong to the same belt of which the Chihuahuan desert is a part. This great possibility remained neglected for the most part as long as Mexican export continued, because of the high cost of American labor, but with the supply interrupted and conditions in our sister republic showing scant signs of early improvement, state officials and rubber men turned their attention to it. Experiments in several localities indicated that guayule, in the United States, as in Mexico, responds readily to cultivation, yielding increased growth and greater storage of rubber in its tissues. Not only does it secrete rubber of excellent quality in both root and stem, but its culture involves fewer difficulties than any other commercially important rubber plant, and it thrives best on lean soils in a dry climate. These facts render it so good an investment of the capital needed that the first Arizona plantation of 9,200 acres, to cultivate it on a commercial scale, promises to be the forerunner of many others soon to follow.

Here, indeed, lies an unparalleled opportunity to turn our vast acreage of arid waste lands to profitable use. What this means to the nation is not difficult to compute. The western arid region comprises about two-fifths of the United States;

that is to say, approximately 1,200,000 square miles or 768,000,000 acres. Of this, not less than 500,000,000 acres have a position, altitude and precipitation that would render irrigation very advantageous, yet under the most favorable circumstances only about 45,000,000 acres are capable of irrigation, of which 31,544,000 acres had already had water placed upon them in 1900.

But what of the other 455,000,000 acres not capable of irrigation? These lands are very rich in mineral plant foods. The potassium and phosphorus have not been dissolved and washed away, and they have continuous sunshine during the day. On such lands the guayule often grows wild and may also be cultivated, although it does not mature as rapidly as under irrigation. In this respect its characteristics are peculiar. Although preferring a dry climate and porous, sandy soils, it endures considerable rain. Stimulated by heavy precipitation or regular irrigation it attains a rapid, sturdy growth with large root development, the latter being particularly important because the greater quantity of rubber is secreted in the roots. Thus, the heavier the growth the greater the crop, but, curiously enough, conditions favorable to rapid, heavy growth are unfavorable to a large

secretion of rubber. The ideal routine consists of irrigation for rapid growth to adequate size, followed by six or eight months of drought to promote secretion of rubber in the tissues, the whole covering a period of four years. Irrigation projects for general crops have the objection that the alkalis, such as sodium carbonate, sulphate and chloride, are often abundant in the sub-soil of these western lands, and when placed under irrigation are brought to the surface in solution by capillarity. When the accumulation of evaporated alkalis reaches a certain amount, many crops will no longer thrive, but guayule will. Already consid-

THREE YEAR

TWO YEAR

ONE YEAR

GROWTH OF GUAYULE ON GROUND CUT-OVER.

erable areas have been abandoned in this manner in every state where irrigation has been practiced. Thus the claim of Courtenay De Kalb that in California guayule under irrigation has been known to produce as much as 28 per cent of its net dry weight

in rubber, if his figures can be substantiated, is of great interest. The conservative estimate, by the way, is 8 to 10 per cent.

De Kalb further states that by four-year intensive irrigation methods, 25 tons of dry plant may be grown per acre. On the basis of 8 per cent rubber this would yield 4,000 pounds, worth \$1,520, according to the present low market price of 38 cents per pound. American experience places the average cost of culture, harvesting, extraction and marketing at \$200 an acre annually, or \$800 for the crop. This makes the net income \$720 an acre or \$180 an acre per year. Few crops surpass this on an average of four consecutive years, and what can be grown on arid soil which will approach so high a return? Assuming that 5,000,000 acres of irrigable land, still unutilized, could be devoted to this purpose, the yield would be 10,000,000 tons for the four years, equivalent to 2,500,000 tons annually and worth \$8,500,000,000.

Once more, what of the 455,000,000 acres of arid agricultural land not capable of irrigation? If planted with guayule and properly conserved according to the principles of modern forestry, they would create a great new American industry that would be a source of wealth in time of peace and a protection in case of war. Fifteen years is considered the proper rotation period, as in that time the maximum economic efficiency of the plant is reached at a height of about 16 inches, when it should be removed, not only for the better growth of younger plants, but for the greater efficiency of seeding.

Thus cuttings should be made close to the ground every fifth year. The old practice of pulling plants up by the roots is to be discouraged as it gives no opportunity for new shoots to be sent up during the next growing season.

Assuming 11,200 plants to the acre and each dry plant aver-

aging 1 pound at 15 years, the yield would be 5 tons of shrub per acre, or 896 pounds of rubber on an 8 per cent basis. Were 455,000,000 acres so planted the yield would be 182,000,000 tons every five years, or an average of 36,400,000 tons annually, worth

\$154,700,000,000 at the current price of 38 cents per pound. Thus, the United States is potentially able to provide within its own borders many times its own requirements of crude rubber.

Reviewing the history of guayule extraction the following points are of interest: The natural habitat of the shrub embraces the northern portion of the great central plateau of Mexico, known as the Chihuahuan des-

ert, and a portion of southwestern Texas, an area of nearly 130,000 square miles, of which about 34,000 square miles actually bear guayule. From this source it has been estimated by Endlich that 225,000 tons of shrub had been disposed of up to 1909, which was about half the total supply originally available. The altitude of this region varies from 2,000 to 10,000 feet above sea level, the average being 6,000 feet, for guayule can withstand very low temperatures as well as summer

heat. The records include 5 degrees F. at Marathon, Texas, and 10 degrees F. at Tucson, Arizona. Very little rainfall is necessary, the average throughout this region being around 10 inches annually, although the growth of the plant is in proportion to the precipitation. The plant grows during the rainy season and creates rubber during the dry months, the residual soil moisture, except in rare instances,

being sufficient to sustain life. Maximum growth occurs early in the warm season, when superficial soil water is most plentiful and night and day temperatures are more nearly uniform. The humidity of the region is relatively high, with a somewhat prolonged summer period of high humidity. Dew is frequent during

IRRIGATED PLANT, TWO YEARS OLD, FROM A STOCK.

the cooler months, the dew-point always being approached closely at night and frequently passed in winter and during the rainy summer season.

Rarely is wild guayule found growing in the alluvial plains of the Mexican plateau. It prefers gravelly, calcareous soil fit for little else, and so, because of its hardness and easy cultivation, lends itself readily to the agricultural development of our arid Southwest. Propagation is from the seed, and artificial fertilization of the flower is essential in order to insure reliable results. As this requires skill, the plants are started in nurseries under the care of trained horticulturists. When the stalks attain a diameter of one-fourth inch they are transplanted to the field in rows three feet apart, the plants standing 18 inches apart in the row. Although each capitulum produces only a maximum of five seeds, a plant of moderate size will yield many thousands, but the percentage of viable seed does not usually exceed 5 to 25 per cent.

To go into the details of the cultural operations of procuring seed, raising seedlings, transplanting them, caring for the growing plants and harvesting the cultivated guayule would trespass beyond the scope of the present article. These details may be found by those interested in a work on the subject by Professor Francis Ernest Lloyd and published by the Carnegie Institution of Washington. It should be apparent from the foregoing, however, that the possibilities of guayule in the United States are almost unlimited; that its growth might easily become one of our greatest agricultural industries, and that it may thrive in the barren lands of the South as well as in the arid wastes of the Southwest.

REFERENCES.

Lloyd, Vol. 41, page 115; "The Future of Guayule," Vol. 45, page 20; "The Propagation of Guayule," Francis E. Lloyd, Vol. 45, page 164; "A Guayule Resume," Harold von der Linde, Vol. 45, page 166; "Notes on the Acclimatization and Cultivation of the Guayule," Francis E. Lloyd, Vol. 47, page 183, and Vol. 48, page 563; "A Journey Through Guayule Land," Henry C. Pearson, Vol. 35, pages 173 and 205.

TIRE REPAIR VULCANIZERS AND ACCESSORIES IN SOUTH AMERICA.

According to our contemporary "The Automobile," American tire vulcanizers are not adequately represented in South America, where there is a good market for such devices.

In Argentina alone there are 30,000 automobiles, every one of which has tire troubles. Moreover, South American automobilists are not as a rule careful of their tires, and hence the need of frequent repairing. There is a good market for small vulcanizers, such as chauffeurs can use, as well as shop vulcanizers for garages. In Cordoba, Argentina, there is a garage with an up-to-date vulcanizing department, its entire equipment having come from the United States.

Non-skid chains are good sellers in every section of South America, in many cases being included as part of the standard equipment of an automobile. Oversize tires are also in demand and generally on sale. Slip covers, made of rubberized fabric, for automobile seats, are popular and sell well in all South American countries.

JAPANESE LABOR FOR BRAZIL.

That arrangements have been concluded to send 20,000 Japanese to Brazil within two years is the report of the American Vice-Consul at Yokohama, Japan. The negotiations with the Brazilian Government were conducted by a representative of a combine of Japanese emigration companies. A group of 5,000 men will be sent twice a year, in the spring and autumn, and the Brazilian Government will contribute £8 [\$39] toward the transportation expenses of each emigrant.

GUAYAQUIL RUBBER MARKET IN SEPTEMBER.

The rubber market in Guayaquil, Ecuador, was quiet during September, the quotations of \$23.30 for *maromas* (ropes) and \$19.07 for *hojas* (sheets) being the same as for August. Shipments amounted to 15,077 pounds, all going to the United States.

RUBBER TRADE OF COLOMBIA.

The rubber producing industry in Colombia is still in its infancy, but it is growing rapidly, and the production for the year 1915 showed 100 per cent increase over that of the preceding year.

The chief purchasers of Colombian rubber are the United States and Great Britain. Prior to the war Germany was also becoming an important buyer. In 1915 the exports of crude rubber from Colombia to the United States amounted to \$89,348, against \$41,849 the previous year; those to the United Kingdom amounted to \$5,018 in 1914, but fell to only \$2,605 in 1915.

Most of the crude rubber exported from Colombia is obtained from wild *Castilloa* trees, but in the Atrato valley, and also in some other districts, there are rubber trees under cultivation.

RUBBER TRADE IN PANAMA.

The American Consul-General at Panama City, Panama, reports that the exports of crude rubber from his consular district during the year 1915 amounted to 70,604 pounds in quantity and \$18,874 in value, against 142,444 pounds valued at \$10,561 exported during the previous year.

According to the annual report by the American Consul at Colon, Panama, the exports of crude rubber and balata from his district amounted to \$128,794 in 1915, against \$65,859 the previous year.

RUBBER IMPORTS AT HANKOW, CHINA.

The American Consul-General at Hankow, China, reports that imports of rubber and rubber goods through that port in 1915 amounted to \$19,263, compared with \$7,918 during the previous year, showing an increase of \$11,345.

RUBBER TRADE OF SIAM.

The United States Vice-Consul at Bangkok, Siam, reports that imports of American rubber goods into that country during the fiscal year 1915-1916 amounted to \$2,011, against \$378 during the previous fiscal year.

The total exports of crude rubber from Siam during 1915-1916 amounted to \$11,055, against \$15,533 exported during 1914-1915.

RUBBER EXPORTS FROM ZANZIBAR.

Most of the crude rubber exported from Zanzibar is derived from the rubber vine, *Landolphia kirkii*, of which a considerable quantity grows wild in the forests of the Pemba district. Exports for the year 1915 amounted to only 2,384 pounds.

The cultivation of Ceara rubber, which was taken up by the government in 1907, was not successful and has been discontinued.

CRUDE RUBBER EXPORTS FROM CEYLON.

From the "Report of the Ceylon Chamber of Commerce for the Half-Year ended June 30, 1916," just received, it appears that shipments of crude rubber to Great Britain during the period covered showed a decrease of about 3,000,000 pounds, while those to the United States showed an increase of about 7,000,000 pounds compared with the corresponding period of 1915. In fact, the shipments to America were more than double the 1915 January to June totals and amounted to well over 14,000,000 pounds.

RUBBER FOOTWEAR IN LIBYA.

The American consul at Tripoli, Italian North Africa, reports that during the year 1915, \$1,000 worth of American rubber shoes were imported into that colony, against \$850 imported the previous year.

Plantation Rubber in Cochin China—III.

By Lawrence P. Briggs, United States Consul at Saigon, French Indo-China.

QUALITY OF COCHIN CHINA PLANTATION RUBBER.

VARIOUS tests show that Cochin China plantation rubber compares favorably with the similar product of other rubber producing countries. The latex produces the usual percentage of rubber and the purity of the manufactured product is not inferior to that of other rubber.

The comparison of the analysis of the latex of the Soui-giao plantation, made by M. Vernet in the Pasteur Institute at Nhatrang, with tests of Brazil and Ceylon rubber shows that the latex of Cochin China contains a greater proportion of rubber than that of Brazil and slightly less than that of Ceylon:

Constituents.	Soui-giao.	Ceylon.	Brazil.
Rubber	37.91	41.29	31.70
Water	54.38	55.15	56.37
Albuminoids	2.30	2.18	1.90
Residue	3.35	.41	0
Sugar	1.43	.36	0
Resin62	0	0
Acids01	0	0
Organic substances	0	0	7.13
Other products	0	0	2.90

The following table shows the results of analyses made at the Michelin factory of the various classes of Soui-giao rubber, compared with fine Para rubber of the Upper Amazon:

	Para.	Smoked.	Natural Coagulation.	Coagulation with Acetic Acid.	Scraps.
Rubber	96.87	94.60	97.02	95.87	94.34
Resins	2.62	4.00	2.44	3.59	1.90
Moisture32	.68	.15	.18	1.66
Residue19	.62	.39	.36	2.10

These tables show the physical composition of Cochin China latex and rubber. The actual physical tests of the quality of Ong-Yem rubber sent to the International Rubber Exposition at London in 1911 gave this rubber a rating of 89.5 points out of a possible 100. Tests were also made to determine its tensile strength (*i. e.*, the weight necessary to break a piece of rubber $\frac{1}{4}$ by $\frac{1}{2}$ by 2 inches), its extension (*i. e.*, the length of the above piece at the moment of breaking), its strain or coefficient of resistance (*i. e.*, the extension produced by half the weight necessary to break it) and its force of tension, or stress (*i. e.*, its coefficient of rupture per square inch). These tests show the following comparison between the Ong-Yem product and fine hard Para rubber.

	Tensile Strength.	Extension.	Strain.	Stress.
Para	59.4 pounds	9 $\frac{3}{4}$ in.	4 $\frac{7}{8}$ in.	440 pounds
Ong-Yem	55 pounds	8 $\frac{1}{2}$ in.	4 $\frac{1}{16}$ in.	475.2 pounds

Cochin China rubber received honorable mention at the Singapore Exposition (1910), a diploma of honor at the London Exposition (1911), a Grand Prize at the Ghent Exposition (1913) and a diploma of honor, two silver medal diplomas, two silver medals and a gold medal at the London Exposition (1914). It is only necessary to add that it receives the highest prices in the rubber market of Paris.

INSTALLATION: COST OF PRODUCTION.

The installation used in the preparation of the rubber varies from a shed containing a set of rollers and some drying space to a fine, large building and the latest modern equipment such as are found on the plantations of Xatrach and Suzannah. The smaller plantations prepare the product with no equipment except a single roller, while the natives roll it into a mass like wild rubber; but the larger plantations are equipped to make the best quality of smoked sheets of crêpe. The Belland estates, which until 1913 produced nearly all the rubber exported from Saigon, now make only crêpe and scrap rubber, while Xatrach plantation, which during the past two years has been the most productive, turns out various grades of rubber in the following proportions: $\frac{2}{3}$ smoked sheets, $\frac{1}{3}$ crêpe, Nos. 1, 2, 3 and 4.

Cost of production has, up to the present time, been such a variable quantity that it is very difficult to say anything about it. Only one plantation or group of plantations—the Belland Estates—has approached its limit of production. The Xatrach plantation is the most productive at present, but its trees are young and some experts are of the opinion that the installation and initial expense was too great for the size of the estate. It is estimated that, when the larger plantations are fully developed, the cost of production will be about 50 cents (United States currency) per kilo—a figure somewhat below that of the neighboring countries of the Far East. None of the plantations have ever been able to produce at this figure, except, perhaps, the Belland Estates, which have practically no installation except crêpe rollers.

THE LABOR PROBLEM.

One of the chief factors of cost of production is labor. The laborers on the rubber plantations of Cochin China are nearly all Annamites or Mois. The cost of coolie hand-labor is about 15 to 20 cents (United States currency) per day for men, and 10 to 15 cents for women, with or without rice. The Annamite is industrious, apt and fairly efficient, but slow. The Mois—a semi-savage tribe—are inferior to the Annamites. The Locninh plantation has imported about 600 Javanese coolies. Their slight superiority to the Annamite may be due entirely to their previous training in this kind of work.

The region directly tributary to the port of Saigon—Cochin China, Cambodia and southern Annam—is not overpopulated. This region comprises more than 100,000 square miles and has a population not much above 5,000,000. It is a very rich country. The exports from the port of Saigon generally amount to about \$40,000,000 per year—more than 70 per cent of the entire export of French Indo-China, although this region has less than one-third of the total population. This exportation is almost entirely of agricultural products—mainly rice, Saigon generally ranking second to Rangoon among the ports of the world in the exportation of this product. During rice-harvest the labor question is sometimes an anxious one, and this will be increasingly true as

NATIVE DEVICES FOR TAPPING AND COLLECTING LATEX.

a—Tapping knife (coupe coupe). b—Knapsack can for collecting latex. c—Cup from joint of bamboo for receiving latex.

the agricultural resources of the country develop. Rice-harvest, fortunately, comes during the dry season when there is least demand for labor on the rubber plantations. Various attempts have been made to transplant coolie labor from the overpopulated districts of Tonkin, where the laborer is more skilful and more industrious and receives smaller wages. This may prove to be the future solution of this problem if it should ever become a serious one. There are many Chinese coolies in Saigon and Cholon, although none has yet been employed on the rubber plantations. Chinese labor is generally slightly more expensive but considerably more efficient than Annamite labor, and there would be no difficulty in inducing Chinese coolies to come in sufficient numbers to supply any demand of the labor market; but Chinese laborers are more independent, and it is quite likely that the French government would object to any considerable influx of Chinese coolie laborers into Cochin China.

The question of health-condition is not a serious one among the coolies of Cochin China. There is always some cholera and often bubonic and pneumonic plague among the natives, and it is thought that the red soil of the rubber plantation is conducive to a peculiar native disease, which the French call "*fièvre du bois*" (fever of the woods); but there has never been a serious epidemic of any kind on any of the rubber plantations. Famines are unknown in Cochin China. Since the beginning of the rubber industry here, the annual exportation of rice from the port of Saigon has never fallen below 600,000 tons. Almost every year Cochin China is called upon to relieve the sufferings caused by drought or flood in Tonkin.

TRANSPORTATION.

After the rubber is prepared, there remains the question of its transportation to Saigon. Some of the older plantations; e. g., the Belland Estates, are within sight of the city; but the newer plantations in the red soil district are more distant. The plantations of Suzannah, Xuan-loc and several others in the province of Bienhoa are located 45 or 50 miles from Saigon, out near the railway running to Nhatrang, while the Xatrach Locninh and other important plantations of the province of Thudaumot are 65 to 75 miles from Saigon by automobile. However, the roads are level and good and the high value of rubber combined with its small bulk makes transportation a question of relatively small importance. The construction of railways and automobile roads through the rubber district offers no serious difficulties, and the development of transportation facilities is sure to keep pace with the settlement of the country. Then, too, Cochin China has a wonderful system of water transportation. None of the rubber plantations are very distant from a stream or canal by which rubber can be cheaply transported by *sampan* to Saigon.

Saigon is the most important French seaport outside of France and is accessible to vessels of any draught. It has regular freight connections with the mother-country as well as with Singapore and Hongkong and frequent service to Manila, Bangkok and other neighboring ports.

PRODUCTION AND EXPORTATION.

The production of rubber in the Saigon district, since its beginning in 1908, has been about as follows in kilograms per plantation:

	1908.	1909.	1910.	1911.
Belland estates...kilos	1,500	3,000	5,000	10,000
Suoi-giao	1,749	2,573	2,086	3,080
Xatrach	120
Suzannah
Others	200	200	300	300
Totals	3,449	5,773	7,386	13,500
	1912.	1913.	1914.	1915.
Belland estates...kilos	12,000	18,000	26,000	28,000
Suoi-giao	3,800	3,527	5,319	14,783
Xatrach	1,870	25,170	77,000	128,616
Suzannah	4,480	24,129	47,242	95,776
Others	2,000	14,174	29,439	79,995
Totals	24,150	85,000	185,000	347,170

The exportation of rubber from the port of Saigon during the same period, by weight and value, has been as follows:

	Kilograms.	United States Currency.		Kilograms.	United States Currency.
1908.....	3,021	\$3,797	1912.....	25,563	\$22,201
1909.....	5,729	4,976	1913.....	85,000	73,823
1910.....	6,379	5,540	1914.....	175,067	152,046
1911.....	13,577	11,792	1915.....	357,003	310,057

These figures represent the customs values, which since 1908 amount to 450 francs (nearly \$90 United States currency) per 100 kilos. At present this is much below the market value. The actual selling price during the year 1915 began with 620 francs January 1, reached 767 francs early in July, which was high-water mark until late in October, when it rose to 1,073, fell again to 911 during the latter part of November and finished the year at 1,223. Taking 850 francs as an average price for the year, the amount of money received by the plantation owners for the 1915 product was nearly \$600,000 (United States currency). Since January 1, 1916, the price has gradually declined to about 1,100 francs per 100 kilograms. If this price is maintained the market value of the 1916 product will be about \$1,650,000.

Practically all this rubber has been exported to France. The war at first interfered with this exportation, and during the latter part of 1914 some of the leading producers were seeking a market elsewhere; but early in 1915 the French Government forbade the exportation of this product to any country except France, and Saigon rubber soon began to find a good market in the mother-country. The price soon began to rise, as shown in the preceding paragraph.

PRESENT STATUS OF PLANTATION RUBBER.

Enough has already been said to show that the production of plantation rubber is no longer an experiment in Cochin China. A few figures will show its present status and future prospects.

Status of the rubber plantations January 1, 1916.

PROSPECTIVE DEVELOPMENT, 1916-1920.

The following tables show the number of trees to be tapped during each of the years 1916-1920, inclusive. The increase in production will undoubtedly be relatively greater than the increase in the number of trees to be tapped, for, with each successive year after the present, the average age of the trees tapped will be progressively greater. In 1920 the annual production should amount to more than 1 kilo per tree, or a total of over 5,000 metric tons.

FUTURE OF PLANTATION RUBBER.

The above calculation takes into consideration only the exploitation of the trees now planted, minus a certain allowance for thinning out. It is well to remember that only about 17,000 hectares are now planted. The full exploitation of the lands now in plantation would increase this amount to over 70,000 hectares, and this amount could easily be doubled. Then as the trees grow older, the production per hectare will at least double, even with a reasonable allowance for thinning out. So the ultimate maximum of rubber production in Cochin China cannot be placed below 80,000 to 100,000 metric tons per year, with an annual market value of at least \$100,000,000.

SOURCES OF RUBBER STATISTICS.

The "Association des Planteurs de Caoutchouc de l'Indochine" issues a small publication of about 100 pages, which is mailed to foreign countries for 10 francs per year. This was originally a monthly publication, but it has recently been appearing only once in two or three months. Occasionally a special statistical number appears. The statistics of this report are obtained largely from the October-December, 1915, number (No. 49) and the special London 1914 and Taiwan 1916 numbers.

The monthly "Bulletin de la Chambre d'Agriculture de la Cochinchine," which now appears every two months, sometimes contains information concerning rubber conditions in Cochin China. This publication is about the size of the "Annales" referred to above. The subscription price to foreign countries is 12 francs per year. The "Bulletin Economique de l'Indochine," a semi-official economic review appearing six times a year, often contains valuable articles on rubber and other industries. It is published by l'Imprimerie d'Extreme-Orient, Hanoi, and mailed to foreign countries for 22 francs per year.

The "Bulletin Financier de l'Indochine" is a weekly paper published in Saigon at 25 francs a year for foreign countries. It contains current economic news and articles and is the chief advertising medium for rubber shares and other property. The decrees of the government of France and of Indo-China relating to rubber and other lands are published in the "Bulletin Administratif de la Cochinchine," which appears every week and will be sent to foreign countries for 20 francs a year, or about 20 cents (United States currency) for a single number. The land regulations quoted in this report are found in the numbers for January 22, 1914, and February 11, 1915.

Several pamphlets have been published on rubber production in Cochin China. Those consulted in the preparation of this report were: P. Morange, "Le Caoutchouc de Plantation en Cochinchine" (F. H. Schneider, Saigon, 1911); J. Lan, "Notice on the Hevea Brasiliensis in Cochin China" (F. H. Schneider, Saigon, 1911), and F. Ripeau, "Caoutchoucs Amazoniens et Asiatiques" (Emile Larose, Paris, 1914).

The export statistics of this report are based on the figures of the customs authorities of the port of Saigon. They are not always exact. Until 1913 no distinction was made between wild and plantation rubber, and the division given in this report is an estimate based largely on statistics of production. Exportation does not always agree with production. For instance, the oldest productive plantation—that of Suoi-giao—sometimes exports its product from Saigon, sometimes from Nhatrang and sometimes from Camranh.

Finally, much of the material of this report has been obtained by the knowledge of conditions gained by a two years' residence in Cochin China, by an extensive correspondence with the leading rubber producers of this colony and by personal observation during visits to the leading plantations.

Foreign Import Duties on Boots and Shoes.

THE following table, corrected to November 20, 1916, shows the foreign import duties on rubber boots and shoes of all descriptions, imported into the various countries from the United States.

Owing to the frequency of tariff changes the figures and information given in this table should be periodically verified. It is also advised that small trial shipments be made in order to

test the rates prior to sending more extensive shipments.

In the first column is given the country, while the next column contains the articles with notes regarding surtaxes, basis of rates, etc. The third column specifies whether the weight is to be taken as gross or net and the last column gives the ad valorem duty or the rate of specific duty in United States currency.

Foreign Import Duties on Rubber Tires.

THE following table, corrected to November 20, shows the foreign import duties on rubber tires of all descriptions imported into various countries from the United States.

The column marked "Weight" shows whether duties are levied on net or gross weight, or include simply the inner packings. The next two columns give the rate of the duty per 100 pounds in United States currency or the rate per cent ad valorem.

In this monograph the surtaxes have been included and the converted rates therefore indicate the actual duty payable.

Certain charges such as warehousing, customs handling, local taxes, revenue stamps, etc., are not included. The rates of duty shown, including the surtaxes as noted, should therefore be regarded as the minima. As changes in duties are likely to occur at any time, frequent verification of these figures is advised.

NEW JERSEY ZINC CO.'S PRICE NOTICE.

The New Jersey Zinc Co., New York City, announces the following prices on American process "Horse Head" brands of zinc oxide on contract for the first half of 1917:

	50 Ton	Less
	Base	Carloads
Selected, cents.....	10¼	10¾
XX, cents.....	9¾	9¾

The above prices are based upon shipment in barrels and are f. o. b. shipping point, with usual freight allowance on carload lots, and are subject to change without notice.

The above products are also available in paper bags of 50 pounds net weight when shipped in carloads. In this container the price will be one-eighth cent per pound less than quoted above. Bags cannot be shipped in less than carload lots. Mixed carloads of barrels and bags cannot be shipped.

The American Chain Co., Bridgeport, Connecticut, manufacturer of Weed tire chains, has purchased the Standard Chain Co., Pittsburgh, Pennsylvania. Plans for combining the sales organizations and part of the office force of the two companies will probably be put into effect by January 1.

RUBBER-SHOD CATERPILLAR TRACTOR.

The development of the mechanical tractor has been a fertile field for the inventors of agricultural machinery who have endeavored to produce a machine that will satisfactorily solve the problems of plowing, cultivating, hauling and operating harvest-

ing and other farm machinery. Compared with horsepower, the tractor has obviously the advantage due to its availability at all times and a more diversified range of usefulness.

The types of wheeled tractors are varied and accomplish the many objects for which they are designed in a generally satisfactory manner, providing the ground or road over which they operate is firm and fairly even. On soft ground and uneven and broken roads, however, the caterpillar tractor is supreme, as its tractive power is almost unlimited and it performs equally well on solid ground and smooth asphalt or macadam roads without injury to the surface of the road.

The modified form of caterpillar tractor shown here is designed for hauling heavy loads over roads and soft ground where wheeled tractors would be at a disadvantage. The shoes of the tractor belt are shod with 24 blocks of solid rubber that increase the tractive power on both hard and soft ground and prevent damage to the road surfaces. [Martin Rocking Fifth Wheel Co., Springfield, Massachusetts.]

RUBBER MAKES A SALVAGE MACHINE POSSIBLE.

William D. Sisson, a New York engineer, has designed a remarkable apparatus with which to explore the bed of the sea, locate wrecked vessels and bring them to the surface. The outfit consists of a tender carrying a number of pontoons, and an almost spherical diving machine equipped with propellers, searchlights, a telephone to communicate with the tender, and four powerful electro-magnets. The latter hold the diving machine fast to the metal side of the sunken ship while an electric drill bores holes for fastening the pontoons. The diving machine is designed to work at any depth down to 2,000 feet.

This device would not be possible without rubber, of which each of these outfits will probably use 3,000 pounds for electrical insulation purposes alone, not to mention the use of rubber hose and rubber mechanical goods on the ship's tender and the rubber or rubberized garments that the crews will need to wear while at their work of raising from the bottom of the sea the treasures that have been lost through storm, attack or accident in the years since iron and steel ships supplanted wooden ones in the world's commerce.

In this connection experiments have been carried on recently by Dr. Sylvio Pellico Portella in Rio de Janeiro, Brazil, using an apparatus somewhat similar to that noted above. An interesting feature is a series of floats of waterproof material, shaped like spheres, cylinders, etc., which are carried down by divers and attached to vessels and then inflated by air pressure from above.

New Machines and Appliances.

SINGLE STRAND TESTING MACHINES.

It is very important to know the strength of individual strands that make up the fabric used in tire building. To meet this requirement the single strand testing machines shown here have been designed. They are constructed on the dead weight principle, without springs or delicate parts requiring attention. The one on the left is operated by hand, and is built with 10-pound capacity by ounces, and 20-pound capacity by $\frac{1}{8}$ pounds. The intermediate one operates by weights, and has a 10-pound capacity by ounces. A motor-driven tester of 10, 20 or 50-pound capacity is shown on the right.

In each machine the drive is made by a non-revolving screw, operated by two spiral-cut gears held in a solid cast-iron housing and packed in grease. The recording head is built as a balance wheel, rotating upon two large, self-aligning ball bearings, and is extremely sensitive. There are no gears or other moving parts to interpose friction, and the pointer is attached directly to the

HAND POWER.

PLUNGER RELEASE.

MOTOR DRIVE.

balance wheel, indicating the breaking strain on a metal dial-segment. The pointer is held in the exact position of the break by a roll clutch, which prevents backlash, and is released and reset by a small hand lever.

The clamps automatically hold the end of the finest yarns. The yarn is then passed over the eccentric, thereby obtaining additional clamping power and giving the tests all the advantage of the spool form without tying. Standard machines are arranged with a distance of 12 inches between spool centers. Loop tests are easily made with this equipment. A novel and easily read compensating stretch device is included on each machine, giving the net stretch at a glance. [Henry L. Scott & Co., Providence, Rhode Island.]

"HURRICANE" FIREPROOF AUTOMATIC DRYERS.

The vast quantity of plantation rubber now being produced in the Far East must perforce be dried before it is packed and shipped to the markets of the world. The problem of drying 108,000 tons, last year's production, must have involved much time, labor and incurred considerable cost to the producers. The automatic drying machine here illustrated

is successfully used for drying a variety of wet materials analogous to crude rubber and therefore presents a suggestion worthy of consideration.

The machine is divided into sections and the heat is so regulated that the material finally emerges in a cool, dry condition. The dryer is divided longitudinally into two com-

partments, one containing the heating coils and the other the endless chain conveyor that carries the material through the machine. Located in the upper part are the fans producing the recirculation of the air.

The drying is accomplished in accordance with the well-known counter-flow principle. The material is slowly carried through the dryer by the conveyor. The general movement of the drying air is directly opposite to this, as the fresh dry air is admitted near the delivery end of the machine. The air is constantly recirculated by the fans, alternately through the material and steam coils, and progresses in a spiral manner through the machine. During this process, the temperature of the air is gradually raised and its capacity for taking up moisture is thereby increased.

Thus the material as it enters the dryer in a cold, wet condition is subjected to the greatest amount of heat, and the greatest amount of evaporation is accomplished. The rapid evaporation of moisture tends to prevent the absorption of an undue amount of heat, so that no injury to the material can result at this stage. As it becomes drier and passes further through the machine, it encounters less and less heat, and is subjected to cooler and drier air. Near the end of the operation it comes in contact with fresh, cool, dry air, so that the final moisture is readily removed and the material delivered dry and cool. [The Philadelphia Drying Machinery Co., Philadelphia, Pennsylvania.]

THE EASTMAN ELECTRIC CLOTH CUTTER.

Motor-driven cloth cutting machines are labor saving devices that could hardly be dispensed with by manufacturers of rubber clothing and other apparel of a like nature. That these machines have a wider field of usefulness is shown by the increasing call for motor-driven cloth cutters from manufacturers of gaskets and automobile tires.

The machine shown in the first illustration is of the reciprocating knife type and built to operate on 110 or 220-volt direct or alternating current. It is equipped with a powerful motor and all bearings are a combination ball and roller bearing type which divides the wearing strain over a large surface and reduces wear and tear to the minimum.

This machine is recommended for all-round work where the lays are higher.

It will cut curves or straight lines equally well in material varying from the lightest silk to the heaviest cotton fabric.

The round knife type shown in the second illustration is also operated on either 110 or 220-volt direct or alternating current. A notable feature of this machine is the standard,

which is so arranged that as the knife wears down it can be lowered into the plate. This makes the blade last longer and insures accuracy of workmanship, as the edge of the blade is always kept close to the throat-plate. It has a knife guard which is a positive protection against the operator cutting himself.

The adjustable sharpening device is arranged so that both sides of the blade are sharpened simultaneously, thereby doing away with any wire edge on the knife. Moreover, the sharpening device is adjustable so

that the operator can obtain any kind of bevel he prefers. [Eastman Machine Co., Buffalo, New York.]

THE STURTEVANT DUST GRINDER.

That the grinding principle of the ancient mill-stone had long since been replaced by newer machines of modern design and construction was a reasonable supposition. That such is not entirely the case, however, is indicated by the accompanying illustration of a modern grinder with upper and nether mill-stones of rock emery. It is the more interesting from the fact of its comparatively recent adaptation for comminuting hard and soft rubber and grinding leather scrap for making leather and rubber soles.

The upper, or bedstone, is bolted to the top casing and is lowered with it directly upon the lower, or runner stone. The clamping ring is next tightened to hold the bedstone case and stone immovably in position and the runner is then lowered away from the bedstone by a hand wheel which regulates the fineness of grinding required.

As in the old principle the material is fed at the center and is gripped between the mill-stones, passing through a continuous rubbing, shredding and tearing action as it works its way by centrifugal force to the periphery where it is discharged into a suitable receptacle.

A duplicate plant consisting of four 42-inch horizontal mills and four special screens, recently installed, has produced, it is claimed, 12,000 to 13,000 pounds of 40-mesh soft rubber dust per day from one unit. That scrap leather and hard rubber may be successfully ground on this machine is obvious. The 42-inch mill is 5 feet long, 5 feet wide and 5 feet high, weighs 5,500 pounds, gross, and requires 18 horse-power. [Sturtevant Mill Co., Boston, Massachusetts.]

VULCANIZER RECORDING THERMOMETER.

A new type of thermometer for recording vulcanizing temperatures up to 800 degrees F., or 425 degrees C., which embraces a number of original features, is shown here. It operates on the principle of the expansion of gas with change in temperature.

A bulb of copper containing nitrogen gas under pressure is connected to a recording instrument by a small copper tube protected by flexible steel tubing. The recording instrument has a helical spring somewhat similar to that used in pressure gages, and the expansion of the gas in the bulb exerts pressure which is conveyed by the capillary tube to the helix, which expands proportionately.

This helix is directly connected to a recording arm and pen which marks on the record chart. Tubing as long as 100 feet can be furnished, if required, so that the recording gage

may be placed at some distance from the point where the temperature is measured. The clock which revolves the chart is mounted directly on the front plate on which the chart rotates, insuring alinement of the clock and chart plate.

The clips holding the chart in position are mounted on the door so that when the door is opened they are automatically swung away from the chart, permitting its easy replacement without interference.

A device is furnished which raises the chart pen from the chart automatically when the door is opened, and frees the pen automatically when the door is closed.

This instrument is also made in indicating form, where desired, to indicate the temperature on a dial instead of recording it on a chart. Several different types of bulbs may be had, either with threaded connection for insertion in mains and pipes, or with lead coating to withstand chemicals and acids. [The Brown Instrument Co., Philadelphia, Pennsylvania.]

A PORTABLE ELECTRIC TIRE PUMP.

The Lectorflator principle apparently reduces the annoyance of tire inflation to the minimum. The carriage outfit shown in the illustration is a combination of a universal motor that will run on

either alternating or direct current, a high-pressure air compressor, a gear box and a condensing chamber, so arranged that all elements are enclosed in a single housing and automatically cooled. It is mounted on a strong, light carriage that is provided with a convenient tool tray and equipped with four rubber-tired wheels.

This outfit has been especially designed to meet the demand of public garages, tire sales rooms and other public places which must dispense free air, but wish to avoid the larger investment, higher operating expenses and loss of space required by large compressor and tank systems.

Each machine is fitted with a long electric cord, attachment plug, gage, high-pressure hose and quick-acting coupling. It will operate from any 110-volt lamp socket and is guaranteed to develop 125 pounds air pressure without overheating. It has a displacement of about $2\frac{1}{2}$ cubic feet of air per minute and will inflate the largest tires to 100 pounds pressure in one or two minutes. [The Black & Decker Manufacturing Co., Baltimore, Maryland.]

A PORTABLE FOOT-POWER SEWING MACHINE.

Here is a light, portable foot-power sewing machine that can be used in any department of a rubber mill where end-piece sewing is required. It is self-contained and designed for moving

about when the use of power is not practical nor convenient.

In tire plants where quantities of rags are used for wrapping the treads during vulcanization, end-piece sewing is an item that includes necessary equipment and considerable labor, both of which could doubtless be reduced by this simple machine.

In footwear factories where cloth books are a necessity and, in fact, wherever cloth liners are used, the need of a sewing machine for joining together the ends is apparent.

The ends of the cloth to be united are laid on a large feed wheel that is provided with holding pins which maintain the two pieces of cloth in relative position and at the same time permit the cloth being stitched during the sewing operation. It is arranged so that the feed wheel can be instantly thrown out of

gear and thereby short stitches and the breaking of needles are entirely obviated.

This machine will sew all kinds of cotton or woolen goods, thick or thin, wet or dry, and is carefully constructed. [Dinsmore Manufacturing Co., Salem, Massachusetts.]

MACHINERY PATENTS.

THE BANBURY MASTICATOR.

THIS machine is of the Pointon type and provided with revolving blades which act in conjunction with stationary surfaces imparting a kneading action to the mass. The drawing

is a cross section of the machine, which is duplex in character, comprising two cylindrical casings A and B in which the two rotors C and D revolve towards each other. The rubber being placed in the hopper at the top, is fed by the weight of plunger E to the rotating blades. The inclined blades of the rotors force the material continuously from the ends of the machine to the

center, rolling and kneading the rubber against the walls of the cylindrical casings until it is thoroughly massed. The casing walls may be smooth, as shown on the right, or provided with grooves shown at F; moreover, the entire surface may be serrated as shown at G. [Fernley H. Banbury, East Orange, New Jersey, assignor to Birmingham Iron Foundry, Derby, Connecticut. United States patent No. 1,200,070.]

PNEUMATIC TIRE BUILDING MACHINE.

The old-time hand method of building tire casings has long since proved to be unequal to the present high production standards. The development of tire building machines has therefore

progressed steadily and the modern American type is almost entirely automatic. The strips of frictioned fabric are supplied under tension to the revolving core and the successive plies smoothed down by rollers.

Paridon's invention, however, possesses cer-

tain novel features that are radical departures from the customary design and are therefore interesting.

The drawing is an end elevation of the machine, which is duplex in construction. The description applies to both units, but will be confined to the one on the right. There are four frames, only one being shown at A, which support two sets of fabric rolls B, liner rolls C and tension rolls D. The frames are moved longitudinally to bring the fabric rolls alternately in line with the core by a reciprocating hydraulic piston E, operated by a four-way valve. As the fabric strip is applied to the core, adhesion of the successive plies is assisted by a jet of air from the nozzle F. The two smoothing rollers G are operated by rack and pinion movement controlled by the vertical hydraulic piston H. The front faces of the smoothing rolls are recessed with convolute openings through which air is forced, materially aiding the stitching operations and preventing the formation of air bubbles between the fabric plies. [Michael Paridon, assignor of one-half to Henry A. Rudd, both of Barberton, Ohio. United States patent No. 1,202,884.]

RUBBER DUST GRINDING MACHINE.

The Gardner machine for reducing rubber to fine powder is of the type in which an abrasive cylinder is rotated and which at the same time receives an axially reciprocating motion. The

cylinder A is formed with a series of abrasive strips set longitudinally on its periphery, between which, openings are arranged for the flow of air forced outwardly by internal fan blades. The cylinder is mounted in a casing B provided with openings for the feed of the material C, a hopper D at the bottom which receives unground fragments, and a hopper E at the top by which the unground fragments are returned to the grinding-cylinder. The casing and the upper and lower hoppers are connected by screened pipes F, G, H with a suction trunk pipe I leading to a draw-off fan and receptacle for the rubber dust. The axle of the cylinder is reciprocated by a bell-crank lever J operated by worm gearing, connected

by a shaft and gearing to the main drive shaft *K*. The feed-mechanism consists of an endless belt *L* provided with projections and spring-pressed rollers *M* that are adjusted by hand wheels *N*. [C. E. Gardner, Gloucester, Gloucestershire, England. British patent No. 10,015 (1915).]

MACHINE FOR MOLDING AND VULCANIZING HOLLOW RUBBER ARTICLES.

According to this invention the method of making rubber bulbs is simplified and the production materially increased. Briefly, the operation consists in drawing the stock by vacuum

into the mold cavities, the edges of the two halves of the bulb being then brought into close contact and vulcanized.

The drawing is a vertical section of the machine, which is a three-ram type of hydraulic press. The mold plates *A* and *B* comprise 25 mold cavities, each being provided with a small opening communicating with air chambers *C* and *D* in the upper and lower head.

Two metal plates, adapted to support the disks of rubber stock,

are placed back to back and inserted between the mold plates where they are alined by dowel pins. The mold is then closed by the hydraulic rams *E* and *F* and a vacuum applied to the air chambers, exhausting the air in the mold cavities and thereby drawing the rubber stock into them. When the bulb halves have thus been molded, the mold is opened and the metal plate removed. Then the hollow platen *G* is moved upward by the ram *H* until it contacts with the sealing gasket in the upper platen. Air under pressure is admitted to the hollow platen, filling the mold cavities, and then the lower mold is raised by the rams *E* and *F*, thereby closing the mold, uniting the bulb halves and entrapping a certain amount of compressed air. The bulbs are vulcanized by exhausting the air and admitting steam to the chambers surrounding the mold. [Fred T. Roberts, Trenton, New Jersey, United States patent No. 1,201,503.]

A more recent invention by the same inventor provides a process and apparatus for releasing hollow inflated articles from the molds. [Fred T. Roberts, assignor to the Aranar Co.—both of Cleveland, Ohio. United States patent No. 1,201,627.]

- 101,416. Rubber pad in sole laying machine. Atlas-Werke Pohler & Co., Stotteritz, Leipzig, Germany.

THE FRENCH REPUBLIC.

- 480,512 (December 23, 1915). Improvements in cores used in vulcanizing. Heinig Johnston and Ohls.
- 480,583 (December 31, 1915). Improvements in apparatus for molding tires. J. H. Coffey and Coffey, Jr.

PROCESS PATENT.

ELIMINATING POROSITY IN RUBBER SOLES. The parts comprising the bottom being assembled, they are placed in a chamber and subjected to a temperature of 130 to 135 degrees F. for 36 hours, thereby eliminating all air, naphtha or other entrapped gases. The bottoms are then attached to the upper and the boot or shoe is vulcanized. [W. Mellersch-Jackson, London, England. (Communication from Boston Rubber Shoe Co., Malden, Massachusetts.) British patent No. 16,226 (1915).]

OTHER PROCESS PATENTS.

THE UNITED STATES.

- 1,202,244. Process of manufacturing brushes. A. H. Timms, Harrow, assignor to Rubber Set Brush Co., Limited, London—both in England.

THE DOMINION OF CANADA.

- 171,196. Process for the manufacture of tire fabrics. L. Lias, Paris, France.

THE FRENCH REPUBLIC.

- 480,713 (January 19, 1916). Process for manufacturing rubber eye-glass frames without seams and without using a mold. E. Kalker.
- 480,735 (January 20, 1916). Elastic fabric adapted to masks for protection against asphyxiating gas; to suspenders, corsets, orthopedic articles, etc., and process for its manufacture. L. Brun.

MISCELLANEOUS PATENT.

A FRENCH STUDDED-TREAD TIRE.

In this tire the use of rubber has been avoided as much as possible. The casing is built up in the usual way, of several plies of frictioned fabric. On this is fitted a protecting cover made of leather or similar material and provided with metal studs.

Referring to the cross-section of the tire, *A* is the casing and *B* the leather protecting cover which is held in place by rivets *C*.

The leather tread *D*, which may be made of other material than rubber, if desirable, is fastened to the protecting cover by stud-ribs *E*, which extend through the fabric plies. The beads *F* are made of leather, or similar material, and applied to the casing in the usual manner. [K. Pauli and Benniger. French patent No. 480,166 (July, 1915).]

New Goods and Specialties.

JOHNSON'S HEEL PROTECTOR.

WOMEN who drive their own cars will be interested in the patented device shown herewith, for guarding the heel of the most delicately shod foot from all danger of scuffing while manipulating the pedals.

The neat appearing shield of patent leather, lined with cream-colored kid, is shaped to fit a feminine style of heel. Across the lower edge is an elastic band about

three-quarters of an inch wide, which can be slipped over the heel of the wearer's shoe, and a longer strap made partly of elastic and partly of patent leather, is sewn to the upper part of the guard on one side and

detachably fastened to the other by a metal clasp. [C. H. Wolfelt Co., Los Angeles, California.]

NON-BREAKABLE BATHING CAP.

The bathing cap illustrated here shows several novel features. It is made of a new and original rubber fabric, wave-striped in contrasting colors, the result being an attractive material particularly adapted to the purpose. The head-band is of a sort specially intended for use where it may be subjected to moisture.

Elastic webbing is encased completely with rubber and vulcanized, thus producing a thoroughly waterproof elastic tape. The claim is that the rubber threads, protected from air and moisture, will retain their elasticity and consequent durability for a much longer time than would similar

fabric not so protected. This elastic, non-breakable tape is also to be used for garters, belts, hose-supporters, suspenders and skirt-facings. [S. & W. Rubber Manufacturing Co., Inc., College Point, New York.]

"SAFETY FIRST" HAND SIGNAL.

The familiar method of signaling with the outstretched hand in automobile driving, when about to stop, slow down or turn a corner, is made effective at night as well as by day by means of a small electric lamp attached to the hand or wrist of the driver, after the manner of a wrist watch, by an elastic band which holds it firmly in place. This two-candle-power, 6 to 7-volt lamp obtains the necessary current through a small cord from a socket in the dash board, and consumes so little that it can be kept lighted at all times and ready for use whenever the driver has occasion to signal. A lamp of different voltage may be substituted, if desired.

The entire equipment is so small and light that its presence on the back of the hand is scarcely noticed by the wearer. It is three inches in diameter and one inch thick. The one-inch ruby

bull's-eye in the center is surrounded by the word "Safety First," cut in the polished nickel case and showing clearly through a lining of white celluloid. [Pittsburgh Electric Specialties Co., Pittsburgh, Pennsylvania.]

BEECHING'S MOISTENER.

The construction of this novel moistening device is simple and effective, needing no adjustments. A soft rubber sleeve completely encircles the glass water container, thereby avoiding all danger of defacing the most delicately finished desk or table.

As will be seen in the illustration, the openings in the rubber are surrounded by slight rings or curbs, so that all of the water does not run back into the container, a thin sheet of moisture being held for use. Another curb sur-

rounds the moistening space, and should the rubber carry up more than the necessary quantity of moisture, small ridges or curbs guide the surplus water back into the receptacle. The moisture is renewed instantly by a slight pressure on the rubber sleeve. [Kimpton, Haupt & Co., New York City.]

ALL RUBBER TOBACCO POUCH.

A dark gray, circular rubber bag, 5½ inches wide and 5 inches deep, affords a handy, flexible receptacle for tobacco which can

be easily carried in the pocket. This bag has a strongly made stitched seam at the lower edge and a band of black fabric at the top, through which is run a narrow black cord, which acts as a drawstring. [United Cigar Stores Co., New York City.]

A NEW DENTAL RUBBER.

Ordinarily, dental rubbers are manufactured from a standard formula, merely by weight, but this improved rubber, intended as a base mounting for porcelain teeth, is prepared according to a special formula, balancing each individual ingredient. It is claimed that the resultant product shows minimum shrinkage, maximum density, takes a high luster with little effort, and remains almost permanent in color, the only change affecting it being solarization; also, that this is the only dental rubber that gives perfect adaptation in the retention spaces of the teeth, hugging tightly any part of the porcelain with which it comes in contact and thus elim-

inating pockets in which food might accumulate. Rubbers made according to this formula are supplied in various colors acceptable to the dental profession. They are not affected by climatic change and can be packed in cases either cold or hot. No foreign materials, such as oils or waxes, are employed to insure plasticity, which is accomplished by purely mechanical means. [The S. S. White Dental Manufacturing Co., Philadelphia, Pennsylvania.]

THE LORETTA LAST, "STRAIGHT-LINE" RUBBER.

The rubber shown here is a handsome one, designed to fit over the latest models of this season's leather footwear for women. It has a medium broad toe of moderate height, and is intended to be worn with the full Louis or Cuban heeled boots. The vamp is of generous height, while the back is sufficiently high to cover the quarter of the shoe or boot over which it is worn. The sole is "rolled edge" and runs in an unbroken piece from the toe up under the instep, along the face of the heel, and thence along the tread. The reinforcements are generous, and the finish such as to commend it to critical buyers. [The B. F. Goodrich Co., Akron, Ohio.]

ROUDEN ICE BAGS.

A highly useful article, formerly confined to European manufacture, but now made in America and supplied to European and South American trade, is the ice bag shown in two styles in the accompanying illustration. These bags are made in red, checked and brown rubberized materials of excellent quality, and are furnished in no less than 20 sizes, including the centimeter sizes required in Europe and Latin America. The neck of the bag is worked on the collar of a screw cap of zinc metal in a manner that insures permanence. Before leaving the factory, each bag is tested to a pressure of 200 to 300 pounds. [Rouden Manufacturing Co., New York City.]

HUGHES "IDEAL WATERPROOF" HAIRBRUSH.

The Hughes "Ideal" hairbrush, with bristles set in a rubber pad, has been on the market for many years. Continued experiments have been made, however, with a view to perfect its

lasting and sanitary qualities, and an improved model, here shown, is now offered under the trade name of Hughes "Ideal Waterproof." It is claimed that there is nothing in this brush

that water can loosen, rust or destroy and it can, therefore, be thoroughly cleansed as frequently as desired. Short and long stiff boar bristles are vulcanized into a cushion of rubber, which is automatically fastened to the handle so that it cannot loosen. The handle, although highly polished in dark mahogany finish, is waterproof and retains its luster after washing. [Henry L. Hughes, New York City.]

"BOODLE BAG" WITH ELASTIC BANDS.

This safeguard device for money or other valuables is secured by two elastic bands fitted with stout clasps, attached about the

leg just below the knee, underneath the stocking. The container is in two sections, thus avoiding any necessity for a bulky and uncomfortable projection when filled. These two flat, oblong cases are made in all varieties of material, from serviceable poplin to the daintiest of silk brocades, and are fastened by means of a flap with metal clasps. The "boodle bag" is an exceptionally presentable article, of great convenience for both men and women when traveling, bathing, golfing, etc. [Boodle Bag Co., Chicago, Illinois.]

SPONGE RUBBER CORN SHIELD.

It is generally understood that corns originate from the pressure of ill-fitting shoes and that to remove that pressure eliminates the trouble. A new corn shield designed for this purpose consists of a ring of sponge rubber, one side of which is porous, the other smooth, and made in various thicknesses to suit the case. This material offers a yielding surface and yet does not pack down as do other pads, and it is claimed that these shields will keep fresh and last indefinitely. The same shield can be removed and applied as often as desired, and can be readily cleansed with warm water and soap.

In using this shield, a small amount of Lexel adhesive gum is applied to the smooth side and allowed to dry for not less than a minute, after which it is placed next to the flesh. [Lexel Foot Ease Co., Ashland, Ohio.]

SUCTION SINK STOPPER.

Stoppers for sinks, set basins and bath tubs are usually made of metal or rubber, and are intended to fit tightly. But as a result of constant wear they become more or less bothersome. Stoppers which depend not upon tight fit, but upon suction or pressure, are made of red rubber in various sizes. There is a plug, which may fit more or less perfectly into the outlet; this, however, being simply to hold the stopper in place. The actual retention of the water is accomplished by its own pressure on the large, flexible rubber disk forming the top of the stopper. The metal post, holding the ring, is molded in the rubber, and will not work loose nor allow leakage through the fitting. [The Durst Manufacturing Co., Inc., New York City.]

"GOODALL SEMI-METALLIC" HOSE.

For severe service and for use under high pressures of steam, air, water, etc., the most satisfactory hose should contain the virtues of both metal and rubber; that is, it should have the

strength and durability of steel, the flexibility of rubber, and be capable of being twisted and turned with little effort and yet without kinking. In the semi-metallic hose shown herewith, a rubber tube overlaid with fabric, similar in construction to the

usual rubber hose, is encased in steel armor. It is claimed that this hose will withstand the highest pressures and render exceptionally long service, being fully protected from external injury while retaining the pliability of an all rubber hose. [Goodall Rubber Co., Inc., Philadelphia, Pennsylvania.]

MOTORCYCLISTS' CLOTHING.

There is no mode of travel as hard on wearing apparel as motorcycling, nor as hard on the cyclist if he be inadequately protected. The force of the wind striking against his body is

tremendous, and air and the dust of the road insinuate themselves into every pore. The stoutest waterproof material, capable of withstanding the most adverse elements, must necessarily be used. Improvements are constantly being made in motorcyclists' clothing, both in fabric and style, and the English and

French today are leaders in practical wearing apparel for this purpose. The upper illustration shows the latest styles in seat-less trousers and leggings, and below are new motorcycle coats.

both single- and double-breasted, with a rear view of the double-breasted model. [The North British Rubber Co., Limited, Edinburgh, Scotland.]

FOUNTAIN PEN WITH SNAP LOCK LEVER.

The special feature of this fountain pen is contained in the improved snap-lock device in the body of the pen, consisting of a raised portion of the metal collar vulcanized in the barrel, and engaging a corresponding groove in the section, holding it firmly in position. By operating the lever with a finger nail stop, shown in the accompanying illustration, the ink reservoir is entirely compressed, thereby preventing the twisting of the sac and consequent trouble when refilling the pen. Other lever-type fountain pens depend on the aid of the pressure bar to operate the lever, but this lever operates by itself independently of the pressure bar.

An entirely new method of fastening the clip to the cap has also been employed. Arms of the clip are inserted in the cap and immersed in a soft substance, which, after being treated by a patented process, is changed to a rock formation anchoring the clip in such a manner as to distribute the strain and prevent the clip from ever becoming loose.

This pen is claimed to be non-leakable, the shoulder fitting tightly against the end of the barrel and forming an air-tight and ink-tight chamber. [Kraker Pen Co., Kansas City, Missouri.]

"MADE IN AMERICA" TOYS.

The fact that we are cut off from foreign toy markets on account of the European war adds new interest to toys of American manufacture. The A. Schoenhut Co., Philadelphia, Pennsylvania, is the maker of "Humpty Dumpty Circus" toys,

comprising an infinite variety of miniature animals, circus actors and paraphernalia which can be posed in all the "stunts" known to real performers under the Big Tent, as well as some unheard of on land or

sea. These laughter-provoking toys are made of wood and leather, their remarkable flexibility being attained by the use of rubber cords in joining together the different parts of the animals and figures.

The "Rolly Dolly" toys, one of which is also shown, are grotesquely amusing figures of practically unbreakable construction and painted with oil colors and heavy enamel varnish so that the paint will not come off. The head of the toy is attached by a rubber cord, causing it to wag in a droll fashion as the toy is rolled about. The "Rolly Dollys" are made in various sizes, from 6¼ to 10½ inches high.

The Editor's Book Table.

THE STABILITY OF VULCANIZED RUBBER AND THE OPTIMUM Cure. By Henry P. Stevens, M.A., Ph.D., F.I.C. Reprinted from "The Journal of the Society of Chemical Industry," London, England.

THIS pamphlet, of value to every manufacturer of vulcanized rubber, recapitulates the common knowledge of the subject, such as the danger of over-curing with consequent hasty deterioration of the vulcanized product, the tendency toward under-curing in order to prolong the life of the product and the fact that this also causes gradual deterioration. The methods of Schidrowitz and of Eaton and Grantham to determine the temperature, period of heating, etc., which will yield the perfect or optimum cure are explained, and it is pointed out that both methods fail to take into consideration the fact that the tensile properties of a vulcanized rubber vary with the age of the specimen. Figures obtained in any sort of tensile or stretching tests will vary accordingly, inasmuch as vulcanization appears to continue very slowly at the temperature of the air. Thus Dr. Stevens concludes that any optimum cure method based only upon load and elongation figures is valueless for technical purposes; rather that it should be based upon a correlation of physical properties and aging tests.

Then follows a corroboratory description of exhaustive experiments with tabulated results, which were more fully referred to in THE INDIA RUBBER WORLD, October 1, 1916. In studying these it is particularly interesting to note that the crêpe rubber compounds cured for 3, 3½ and 4 hours all show greater deterioration over any given period than the corresponding sheet rubber compounds. This Dr. Stevens attributes to the method of preparation. Whereas sheet rubber is merely squeezed after coagulation and retains the original shape of the coagulated rubber, crêpe rubber is put several times through a washing mill where it is torn up and ground in a stream of water. In his experience, the extent to which rubber is worked previous to vulcanization tends to reduce the life of the vulcanized product.

THE FUNCTION OF LITHARGE IN THE VULCANIZATION OF Rubber, Part II. By Henry P. Stevens, M.A., Ph.D., F.I.C. Reprinted from "The Journal of the Society of Chemical Industry," London, England.

Dr. Stevens here reviews and discusses the investigations which have been made to determine the influence of the resinous constituents. In 1912 Beadle and Stevens showed that the removal of the greater part of the resins by acetone extraction retarded the cure, impaired the tensile properties and increased the perishability of the vulcanized product. L. E. Weber corroborated these statements and even expressed the belief that "the resins play an active part in the vulcanization, and not merely as a catalyzer, their presence being absolutely essential," in fact that the compound prepared from resin-extracted rubber "could not be vulcanized," this latter statement being based upon the poor tensile properties of the rubber.

In the present pamphlet, however, Dr. Stevens maintains that rubber may possess poor tensile properties and yet be vulcanized to some extent or even over-vulcanized. He refers to his own investigations to the effect that the degree of vulcanization is largely dependent upon the relative proportions of rubber, sulphur and litharge in the compound, and points out that the highly specialized type of compound containing litharge which Weber employed appears to be hardly suited to the purpose of ascertaining the specific vulcanizing properties of any particular rubber sample. The fact that an essential criterion of a properly cured rubber is its aging quality was also emphasized, any conclusion based upon the coefficient of vulcanization or upon physical tests with the freshly vulcanized specimen without taking the aging quality into consideration being inaccurate. Then fol-

lows a detailed account with considerable tabular matter descriptive of an exhaustive series of tests pointing to the following conclusions:

Certain types of litharge compounds cannot be sufficiently vulcanized to bring out their full tensile properties and coefficient of vulcanization without over-curing and consequent deterioration or "perishing" with age. The removal of resinous matter by acetone extraction retards vulcanization, as indicated by the tensile properties and coefficient of vulcanization, particularly with compounds containing litharge. It also reduces the "stability" of the vulcanized compound, the effects of over-curing being more marked than with untreated rubber. Throughout the tests it was noticeable that plantation smoked sheet rubber vulcanized faster than the air dried (pale) sheet, although in other respects both behaved similarly.

EXPORTING TO LATIN AMERICA. BY ERNST B. FILSINGER. D. Appleton & Co., New York City. [Large 8vo, 565 pages. Price \$3.]

To the importer—whether of rubber or of any other commodity—and more particularly to the exporter, this book is indispensable. It contains a vast fund of varied information essential in making a success of exporting to our neighbor republics to the southward. Written by a business man for business men, it dispenses facts rather than theories, and provides an intimate first-hand knowledge of the economic, social and commercial situation of each South and Central American country that will enable manufacturers in the United States to deal directly with their prospective customers. The resources, industries, needs and purchasing power of each are detailed; the business methods and characteristics of the Latin people are described, and former European export methods which have pleased them are discussed. Considerable space is devoted to tariffs, custom house regulations, packing, shipping routes and facilities, local agents and publicity, while the appendix constitutes in compact form a comprehensive encyclopedia of statistical and descriptive information, including an extensive bibliography of magazines, dictionaries, grammars and books devoted to travel and the principal industries. Intelligent classification and indexing makes any needed item available at a moment's notice.

Our readers will find this book of especial interest because rubber and rubber goods are so frequently mentioned. The author points out that although much of the crude rubber of the world comes from Brazil and Peru, manufactured articles of which rubber forms the basis are not produced in either country. As a consequence a splendid market exists for nearly every line of rubber goods in demand in the United States, particularly rubber footwear, raincoats and other waterproof clothing adapted to the climate, druggists' sundries, rubber and woven hose, tubing, sheeting and blankets, erasers, mats, life preservers, etc.

Manufactures are growing rapidly in South America and natural resources are being developed so that much rubber belting and insulated wire are being used. The adoption of the motor car in large cities for pleasure driving, parcel delivery and even freight handling, together with the increased building of improved country roads, are ever demanding more rubber tires. Games and sports are being introduced which insure an increasing need of tennis and golf balls, rubber-soled shoes and the like. Indeed, the rubber manufacturer, in whatever line, will find a considerable outlet for his product if he will but study this market and approach it in the right way. Until the war, Germany held a virtual monopoly of South American trade, chiefly because she made it a point to give these merchants what they wanted, carefully packed so as to arrive in perfect condition, prepaid to its destination and piloted through the custom

house by local agents so that the customer was freed of all annoyance. Our Latin neighbors are now of necessity turning to us, and it remains to be seen if we shall do as well. Such writers as Mr. Filsinger have pointed out the way, but the volume of trade we retain after peace is declared will be the measure of our success.

PARA RUBBER PLANTING IN MALAYA. BY PIERRE DE BONDY, Ipoh, Perak, F.M.S. The Times of Malaya Press, Limited. [8vo, 84 pages, paper. Price \$1.]

This volume consists of an estimate for opening 2,000 acres in five years together with an itemized statement of the total expenditure up to the seventeenth year inclusive, showing cost of rubber production and the profits based on rubber at 1s. 6d. per pound. According to the author's statement, capital will be required up to the seventh year to the extent of \$537,329, or \$268 per acre. The yield will begin the eighth year and net profits the tenth year (\$1402), and in increasing ratio thereafter until \$553,150, or 102 per cent is reached in the seventeenth year, the total profits up to that time being \$3,103,473, or 577 per cent. From the itemized yearly statements one gets an intimate knowledge of the various overhead and other expenses incident to rubber growing, the prevailing rates of payment, etc.

THE MOTORIST'S HANDBOOK ON VULCANIZING AND THE CARE of Tires. Harvey Frost & Co., Limited, London, England. [8vo, 56 pages, boards. Price, 1s.]

This concise yet comprehensive handbook deals with tire vulcanizing from the standpoint of the private motorist, particular attention being given to the care of tires which will reduce the necessity for vulcanizing to the minimum. The best treatments for punctures, nips, bursts and blow-outs in tubes are described minutely and well illustrated; also joining tubes, reseating valves and vulcanizing the seating. Casing repairs are gone into at considerable length, including the filling of cuts and vulcanizing of square tread covers, grooved covers, and studded covers. The treatment of loose treads and blisters is described and canvas defects and reinforcements are taken up in detail. Methods of patching with the aid of a steam mandrel are reviewed, also reversing the cover and replacing damaged canvas with new material. Vulcanization and inflation tables are given, together with description and prices of the leading British portable vulcanizers, mandrels and repair materials.

NEW TRADE PUBLICATIONS.

Any of the following publications will be supplied by those issuing them upon request.

ARTHUR JACKSON WILLS, North Brookfield, Massachusetts, manufacturer of special machinery for rubber work, sends a very attractive six-page folder descriptive of his specialties, such as overflow trimmer; carton erecting, filling and closing equipment; rubber edging plaiter, etc.

* * *

The Barber Asphalt Paving Co., Philadelphia, Pennsylvania, has recently published "The Good Roof Guide Book," which will be of interest to the many manufacturers of rubber goods now engaged in enlarging their plants. "Genasco Ready Roofing," with its layers of Trinidad lake asphalt between layers of burlap, wool felt and a surface of crushed quartz, possesses qualities of special value for use on factories, warehouses and storage sheds, which are convincingly described in this handsome pamphlet.

* * *

"The Circle" is the name of a bright and attractive monthly magazine published for and by the employees of The B. F. Goodrich Co., Akron, Ohio. Two concentric circles have been worked into the design on the title-page, the words "Employer—Public—Employee" occupying the space between them. This and the contents of the publication indicate clearly that the intention is to create a closer bond of friendship, better firm spirit and

team work. The news of the entire Goodrich organization, with numerous illustrations, forms the principal feature, although considerable attention is given to the problems of home life, athletics, and new books in the Goodrich library, not forgetting a goodly amount of brightening humor. The general program embraces fiction, biography, history, mechanics, economics and recreation, and every employe is encouraged to make helpful suggestions.

The live-wire publicity man of the American Chicle Co., New York City, is issuing at frequent intervals a large, illustrated news sheet called "Chicle-Chat." The Harvest Edition, September and October numbers combined, has the breezy character of energetic salesmanship and will interest everybody who sells chewing-gum. In addition to the general news of the trade and many personal items, nearly a page has been devoted to the interesting story of chewing-gum manufacture, from its origin as the milky juice of the Zapote tree, found chiefly in Mexico, to the finished product.

UNIQUE "M. R. X." ADVERTISING.

The Standard Emarex Co., New York City, manufacturer of the hydrocarbon filler "M. R. X.," is distributing a unique advertising novelty. It consists of a rubber inkwell taking the form of a conical pile of tires of diminishing size surmounted by a stopper bearing a ball handle, the idea being to show the character of black rubber containing this well-known filler.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[237.] A correspondent requests names of rubberizing houses.

[238.] Information is sought concerning machinery for milling sheet rubber to uniform thickness.

[239.] Names of manufacturers of rubber sheeting for hospital use are requested.

[240.] An inquirer wishes to know how to compute the size of a casing and that of the corresponding tube.

[241.] Information is sought regarding the character and extent of purchases of manufactured goods, particularly farm implements and machinery, that an average rubber plantation would be likely to make.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

An automobile garage proprietor in Venezuela desires the agency for American tires. Report No. 22,795.

Quotations are desired by a firm in Spain on medical and surgical rubber goods, rubber overshoes and raincoats, rubber heels, suspenders and fountain pens. Report No. 22,854.

A firm in Russia wishes to communicate with American manufacturers of garters. Report No. 22,874.

Representation of an American manufacturer of raincoats is sought by a merchant in Spain. Report No. 22,879.

Commercial relations are desired by a business house in Portugal with American manufacturers of rubber thread and thin rubber used in the manufacture of suspenders, garters, etc. Report No. 22,922.

A wholesale druggist in Spain wishes to import rubber articles. Report No. 22,975.

An import house in New Zealand desires to enter into commercial relations with American manufacturers and exporters of garden hose and rubber goods for household use. Report No. 23,044.

Interesting Letters from Our Readers.

FUTURE SUPPLY AND DEMAND IN CRUDE RUBBER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—The probable course of the rubber market after the war is becoming a source of diverse opinion among the trade. Until peace has been declared, the market will be extremely sensitive, but what of supply and demand after that?

Of course the former German and Austrian consumption of about 20,000 tons annually is offset by the needs of the American automobile tire industry, that has absorbed most of the increased output of crude rubber. The outcome of a return to normal conditions, however, will depend upon this production as compared with the logical increase of the world's consumption. Replenishing the exhausted supply of the Teutonic nations will cause only a temporary flurry. Cheap synthetic rubber does not promise to become a factor, although German chemists have been spurred to great efforts in this direction.

In an attempt to forecast future production and consumption several significant facts have been presented in Rickinson's monthly review of "The World's Rubber Position," and in "The Financial Times," London.

Regarding production, it is stated that the output of wild rubber from Brazil and elsewhere has been practically the same for several years and probably will remain so, but that the development of rubber plantations increased the world's output 31.8 per cent in 1915, while the increase for 1916 is estimated at 27.3 per cent. As no considerable areas have been planted since 1911, however, the belief is expressed that this rate of increase is not likely to be maintained. Although 214,000 acres were brought into bearing in 1911, it is pointed out that the total increase between now and 1920 will probably not exceed 377,000 acres, so that any greatly expanded output must be the result of increased production per acre. The average yield, I understand, is now 336 pounds per acre, and in 1920 it may have reached 400 to 450 pounds. This would insure a world's output of 300,000 to 330,000 tons, provided the wild rubber supply remains constant.

To forecast consumption appears to be far more difficult. During the past six years the average increase in the United States has been 24 per cent. Were that rate maintained there would be a serious rubber shortage in 1920; indeed, an increase in the world's demand of 20 per cent per annum would require 373,000 tons in 1920. While such a continued increase seems improbable, there is every indication that the growth of the motor car industry, the use of rubber for new purposes and the certain requirements of Europe after the war may render the expected increase from plantations during the next five years none too great to meet the world's requirements.

ANOTHER VIEW.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—We believe it fair to assume that as the present plantation trees age, the girth being larger, the output of latex will increase in proportion, but when this yearly increased production ceases to be an important factor, we are not prepared to say, and, therefore, will not calculate any increase beyond 16 years of age, considering the output after this period at maximum. Therefore the following is based upon:

1st—Tree will reach its maximum output at 16 years of age.

2nd—No planting after 1915, other than enough to take care of such as may die, or be destroyed. The acreage January 1, 1916, being 1,377,000.

3rd—A fair average increased production yearly from the fourth year to the 16th, after which the output remains the same.

On this basis of calculation we secure the following production for the years indicated:

PLANTATION RUBBER.

Production.	Estimated.	Reported.	Under Estimated.	Over Estimated.

1929.....	503,261
1930.....	508,794
1931.....	510,311

The yearly increase progresses proportionately, but with a lessened percentage of increase each year up to 1931, when all trees planted prior to January 1 last, would reach their sixteenth year of maturity, and during which year the output would be 510,311 tons, after which the production would remain the same.

According to these figures there is ample crude gum in sight, and the riddle of the future appears to be on the consumer's side more than on the side of the producer, as it is hardly possible that the acreage under cultivation will not be increased beyond what it is at this time, to say nothing whatever about the increased latex from the trees as they reach a period beyond 16 years of age. In the above we have not included any wild rubbers, covering the plantation product only.

A LARGE RUBBER FIRM'S OPTIMISTIC OPINION.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—So many industries are face to face with constantly decreasing supplies of raw material and ever increasing demands that the contrast afforded by the rubber business looms up vividly.

In 1905 uncultivated or "native" rubber comprised 60,800 tons, while in 1914 the production had dropped to 60,000 tons. But during the same period plantation rubber had risen from 145 to 64,000 tons. From the best available figures we estimate that while native rubber production will have fallen to 34,500 tons in 1917, plantation rubber will have reached 147,000 tons. By 1921 probably 209,000 tons of cultivated rubber will be available, while the supply of native rubber will have dropped to 30,000 tons.

When crude rubber reaches that level of cost which vastly increased supplies would indicate, myriad new uses will be added to those for which the present relatively limited production is

required. As ranches and open ranges become converted into farms, and the number of cattle decreases, lessening the supply of leather, while the population which must wear shoes and the factories which must have belting increase, rubber will step in more and more to furnish better service at even lower cost.

THE LARGEST HEVEA?

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Passing through Shanghai last week, on the way home from the East Indies, a subscriber in the Chinese port lent me the September INDIA RUBBER WORLD, just received, in which there was, on page 652, the account and illustration of the

GIANT *Hevea Brasiliensis* IN CEYLON, GIRTH 10 FEET 4 INCHES.

largest *Ficus elastica* tree. about the size of the Rambong (*Ficus elastica*) that visitors are shown growing in the Plaza in front of the old cathedral in the Walled City, Intramuros, Manila.

The native caretaker, standing on the right of the picture, informed me that the Ceylon giant produced nearly 400 pounds of dry rubber in the five years ending with 1914, when tapping was stopped. The numerous seeds, however, are distributed abroad to planters who apply for them, and it is undoubtedly the parent and grandparent of some extensive estates. The photograph was made by William B. Daniel, nephew of C. A. Daniel, president of the Quaker City Rubber Co., Philadelphia, Pennsylvania.

RICHARD WEIL.

On board R. M. S. "Empress of Asia," October 14, 1916.

AN AMERICAN OPPORTUNITY IN RUSSIAN FOOTWEAR SCRAP.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—No doubt you are aware of the fact that Russia is the greatest country for rubber shoes, and for that reason has been supplying more old shoes than any other nation. Until the war Germany and England were the biggest buyers of old rubber shoes, while the United States got only a trifling quantity that Russia exported.

Since the war broke out an embargo has been placed by the

Russian government on all rubber products, and also on old rubber shoes, which resulted in a very big accumulation of the latter in that country. We think, therefore, that now would be the right time for an American concern to buy up as much as possible of this stock, and have it stored away in Russia until after the war. The cost of storage would be insignificant in comparison to the gain in rate of exchange, the Russian ruble now being between 29 and 30 cents, whereas in normal times it was 51½ cents. RUSSIAN-AMERICAN AGENCY OF COMMERCE.

New York City, November 21, 1916.

JUDICIAL DECISION.

COHEN V. FIDLER & Co., ENGLAND. This suit to restrain infringement of the trade-mark "Regent" hinged upon whether its use upon waterproof garments known as "yarnproof" anticiated the subsequent use of the mark by another party upon rubberproof garments, the defendant maintaining that, as he had been the first to use the mark upon rubberproof goods, the plaintiff's prior use of it upon "yarnproof" goods would not enable the plaintiff to enjoin his continued use of the mark. It was held by the court that the goods were of the same descriptive properties, and that inasmuch as the defendant's adoption of the mark was with knowledge of the plaintiff's use and rights, he was not entitled to register his mark under the provisions of the trade-mark act, which permits the registration of an identical mark for more than one party, where there has been honest, concurrent use. [United States Trade-Mark Association Bulletin, October, 1916, page 263.]

DE LASKI & THROPP PATENT NO. 1,011,450 VALID.

In our November, 1916, issue, under Judicial Decisions, the De Laski & Thropp patent No. 1,011,450 for a tire wrapping machine was published as void. This was an unfortunate error in the records, which we are pleased to correct. The patent actually involved was No. 822,561, relating to a mold for vulcanizing tires.

GRANULATED CHICLE DUTIABLE AT 20 PER CENT.

The protest of G. W. Sheldon & Co., New York, claiming duty at 15 per cent ad valorem as "crude chicle," was recently overruled. The Board of General Appraisers held that chicle, imported in a granulated form, from which the moisture has been extracted, is advanced in value and is properly classifiable under paragraph 36, tariff act of 1913. This reads: "Chicle, crude, 15 cents per pound; refined or advanced in value by drying, straining, or any other process or treatment whatever beyond that essential to the proper packing, 20 cents per pound."

ASBESTOS IN ARIZONA.

Up to the present time Canada was the only locality in America where long fibered asbestos was obtained. While Wyoming produces asbestos, this material is of the serpentine type and is short fibered. Lately large deposits of the long fibered type of asbestos were discovered in Arizona, the largest deposits being in the Sierra Ancha and at Ash Creek. The asbestos of Arizona is chrysotile asbestos and is found in lime and diabase. Its nature makes it especially useful for the manufacture of fabrics. The high-grade material is at least 50 per cent of the total asbestos mined and is the only grade that is being shipped, due to the high freight. [Metallurgical & Chemical Journal.]

The Canfield Rubber Co. of Bridgeport, Connecticut, was granted a drawback allowance early last month on the exportation of dress shields, infants' specialties, diapers and bibs, with the use of imported galloon binding, Japanese silk, lace trimming, beading, frilled webbing, tape and drawing strings.

The Obituary Record.

THE DEAN OF FIRE HOSE SALESMEN.

ISAAC BELKNAP MARKEY, vice-president of the Eureka Fire Hose Manufacturing Co., Jersey City, New Jersey, died at his residence in Brooklyn, New York, November 7, aged 83

New York and New England when Robert D. Evans traveled in the western states. Upon Mr. Evans' retirement from the firm of C. H. Clapp & Co., Mr. Silliman secured an interest, and when the firm went out of business he associated himself with the

F. S. SILLIMAN.

I. B. MARKEY.

PHILIP BRAENDER.

years. Mr. Markey was born in Little Britain, New York, and for the last 45 years was actively connected with the fire hose industry, most of this time with the above-named company. For 25 years he was a traveling salesman, visiting every part of the country, and becoming intimately acquainted with city officials, and fire department chiefs. During his business life he saw many important changes in the fire hose trade, including the evolution from leather hose to copper riveted linen hose, and then to the tubular woven, rubber-lined linen hose of today.

Mr. Markey was a familiar figure at the conventions of the International Association of Fire Engineers, attending every convention of that body since 1873, and the appreciation in which he was held was evidenced by the presentation to him, a few years ago, of a beautiful diamond-studded badge of that association. He was familiarly known as "Uncle Ike" by his many friends and associates. Mr. Markey was a member of several Masonic bodies, a life member of Mecca Temple, a member of the Independent Order of Elks, and of the Machinery Club.

He leaves a widow, two sons and three daughters.

WELL-KNOWN VETERAN RUBBER SALESMAN.

Francis F. Silliman, for many years a salesman in the rubber business, died at his residence in Malden, Massachusetts, November 14, aged 81 years.

He was born in East Haddam, Connecticut, and on completing his education entered the factory of the Hayward Rubber Co., at Colchester, Connecticut, where he learned the trade of making rubber boots. With several others he went to Malden when E. S. Converse organized the Boston Rubber Shoe Co. In the early sixties he was sent by C. M. Clapp & Co. to Cincinnati to straighten out some trouble over a government contract, and soon after became salesman for that firm, then handling the goods of the National India Rubber Co. at Bristol. He covered

Cable Rubber Co., retiring from business about five years ago because of old age.

Mr. Silliman was a member of the Malden Common Council for several years, and in 1885 and 1886 was an alderman. He was a member of Mt. Vernon Lodge of Masons and Hugh de Payens Commandery of Knights Templars, a trustee of the Malden Savings Bank, and for many years a member of the First Baptist Church in that city. He is survived by his widow and one son, Edwin B. Silliman, western salesman for the American Rubber Co.

A PROMINENT TIRE MANUFACTURER.

Philip Braender, president of the Braender Rubber & Tire Co., Rutherford, New Jersey, passed away at his home in White Plains, New York, November 4. Mr. Braender was born in Germany in 1849, and at the age of 16 came to America where he entered the real estate and building business in New York City. Some of his best-known buildings are the Braender Apartment House and the Ashland Building, the latter being on the site of the old Ashland House.

While still maintaining his active connection with the prominent New York firm of contractors and builders bearing his name, he entered the rubber business in 1911 in conjunction with the late Frank McGowan under the firm name of Cable Pneumatic Tire Co., and later in 1912 took over this interest under the present name and associated with him the late G. Strauss, formerly with the Goodyear Rubber Co. in the manufacture of bicycle tires.

Mr. Braender was also president of the Braender Building & Construction Co., of New York, a member of the Arion Society of New York and Teutonia Lodge No. 617 A. F. & A. M. He leaves a widow, and four sons connected with the company. His estate of \$1,000,000 is divided among the members of his family.

The Rubber Cargo of the "Deutschland"

OUR highly esteemed contemporary "Le Caoutchouc & la Gutta-Percha," under date of September 17, publishes the following:

If we are to believe information coming from the United States, the famous German commercial submersible boat "Deutschland" has left Baltimore with a cargo made up chiefly of rubber.

This exportation of rubber is going to put in a rather peculiar position the Rubber Club of America, of which Mr. Firestone is now president, and which has pledged itself to the British Government—to which now belongs the control of rubber—that none of the rubber imported into the United States will be re-exported to the "Central Empires."

It is under this express condition that Great Britain allows the supplying of the United States with rubber and it is this express condition that has been outrageously violated in the case of the "Deutschland."

It is quite evident that there are in America a sufficient number of pro-German concerns, and even of unscrupulous merchants, who, in the presence of an opportunity for exceptional profit, would not hesitate to violate a solemn pledge and to furnish to the captain of the "Deutschland" all the rubber he could take away. Nevertheless, the responsibility of the Rubber Club is engaged, and we are curious to know what measures the British Government will take concerning it.

Will it (the British Government) stop imports for a few weeks? With a consumption that will exceed 100,000 tons this year, our good Yankees would be slightly famished, but they would learn to know that pledges must be respected.

(D).

While acknowledging the consistent fairness of "La Caoutchouc & la Gutta-Percha," we still feel that there are many circumstances of which they are not cognizant, else the above would not have been written. The Rubber Club of America, Inc., of which Mr. Firestone is the president, has not "pledged itself to the British Government that no rubber imported into the United States would be exported to the Central Empires": first, because no such pledge was ever demanded or exacted by Great Britain; and second, because the Rubber Club was in no position to pledge itself to a demand of that character. The Rubber Club from time to time adopted the practice of explaining to individual rubber manufacturers and importers the terms upon which they could secure the release of rubber from the British Government as laid down by their rules and regulations. As for the rubber that went to Germany on the "Deutschland," it was sold by one who had signed an individual guaranty and thereafter violated its terms, and over whom, manifestly, the Rubber Club should have had no control. The shipment of rubber, as nearly as can be known, amounted to about 100 tons. Actually it was about one-tenth of one per cent of the rubber that had come into the United States since the embargo was lifted and guaranties exacted.

Although our contemporary has not yet mentioned it, it is probable that further feeling will be developed by the second "Deutschland" cargo, now on its way to Germany. This is also a little over 100 tons of rubber, but it is rubber that was bought in the Dutch East Indies, by parties not connected with the American rubber trade, either as importers or manufacturers, and was a transaction which involved no guaranty and for which the American rubber trade or The Rubber Club of America, Inc., are in no way responsible. In other words, American rubber importers and manufacturers individually have lived up to their guaranties with wonderful unity and good faith and we have no doubt that "La Caoutchouc & la Gutta-Percha," now the facts are made apparent, will frankly admit it.

RUBBER CLUB ANNOUNCEMENTS.

IN ADDITION to the prominent speakers that were mentioned in the November issue of THE INDIA RUBBER WORLD, Bishop Frank Du Moulin, Bishop Coadjutor of Ohio, will address the Rubber Club at the annual banquet to be held in New York City January 8 in the grand ball room of the Waldorf-Astoria. Many prominent men of national reputation have been invited to attend, including the President and Vice-President of the United States; the Governor of the State of New York and the Mayor of New York City; the chairman of the Federal Trade Commission and several ministers and ambassadors of European and South American countries.

A new and pleasing tribute to the ladies will be the reservation of the boxes surrounding the ball room for their use after the banquet, when the speeches will be made.

RUBBER CLUB EXECUTIVE COMMITTEE MEETING.

The executive committee of The Rubber Club of America, Inc., held a meeting November 20, at the Whitehall Club, 17 Battery Place, New York City. Messrs. Firestone, Hodgman, Cartwell, Bruyn and Pearson were present. The usual routine business was transacted, two firm members dropped for non-payment of dues and the resignation of F. G. Burgess, Hodgman Rubber Co., Boston, Massachusetts, was accepted. The following firm and associate members were elected:

FIRM MEMBERS.

New York Insulated Wire Co., New York City.
Representative, L. O. Brewster.
Mitsui & Co., Ltd., New York City.
Representative, Tamotsu Nagano or Sadatka Tishima.
The Goodyear Rubber Insulating Co., New York City.
Representative, H. C. Green.
W. H. Whittaker & Co., New York City.
Representative, Samuel H. Clark.
J. Spencer Turner Co., New York City.
Representative, John E. Rousmaniere.
The Whitney Blahr Co., New Haven, Connecticut.
Representative, M. E. Chester.
Victor Balata and Textile Belting Co., Brooklyn, New York.
Representative Charles E. Aaron.

ASSOCIATE MEMBERS.

United States Rubber Co., New York City.
Representative, Ralph W. Ashcroft.

THE SPRECKLES RUBBER PLANTATION.

John D. Spreckles, of sugar fame, is also president of the Savage Tire Corporation, San Diego, California. As tropical plantations are no new venture to him, he has lately acquired large rubber plantations in Java—another bit of American forehandedness.

The North British Rubber Co., Limited, Castle Mills, Edinburgh, Scotland, informs us through its Canadian branch that a man giving the name of Mr. McKenzie is falsely representing himself as being in the employ of the company. The coöperation of the trade is requested in arresting this man, and any information that would assist in locating him should be addressed to The North British Rubber Co., Limited, 43 Colborne street, Toronto, Canada.

News of the American Rubber Trade.

PENNSYLVANIA RUBBER CO. APPOINTS SALES DIRECTORS.

GENERAL Manager Lewis of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, announces that in order to give more personal attention to the business in various sections of the country it has been decided to establish districts, each under a sales director. The following appointments have been made: G. C. McCullough, eastern territory; D. D. F. Yard, southern district, James Q. Goudie, central states; C. F. Kent, the West; James F. Madden, Pacific Coast. Vice-president Charles M. DuPuy, who established the branches in both Pittsburgh and Philadelphia, will, as heretofore, take personal charge of the Pennsylvania district.

BUILDING ACTIVITIES OF BUFFALO FOUNDRY & MACHINE CO.

The Buffalo Foundry & Machine Co., Buffalo, New York, is in a continuous state of expansion. A new steel shelf shop, 34 by 110 feet, recently completed, will contain, exclusively, steel shelves for the company's vacuum dryers. This building is of structural steel with steel sash and asbestos-covered corrugated steel and in connection with it a Kuhn steel storage shed, 28 by 58 feet, is also being erected.

Bids are being received for a new testing laboratory, 75 by 90 feet, of brick and concrete, which will contain a chemical and physical laboratory for the chemist of the foundry and the chemist and testing engineer employed in connection with the vacuum drying business of the company.

A brick and concrete addition to the present pattern storage building is also planned, which will double the capacity of this storage.

NEW JERSEY CAR SPRING & RUBBER CO. APPOINTMENTS.

The New Jersey Car Spring & Rubber Co., Jersey City, New Jersey, announces that, following the resignation of S. P. Woodward from his position as general and sales manager, J. W. Paul will act as sales manager of mechanical goods and L. K. Rittenhouse as sales manager of the tire department. Mr. Paul has been associated with the company for some time past as assistant sales manager, having formerly been manager of the Pittsburgh (Pennsylvania) branch of the Diamond Rubber Co. Mr. Rittenhouse was recently connected with the Norwalk Tire & Rubber Co., previous to which he was, for about ten years, associated with the interests of the Diamond and Goodrich companies as district manager at Boston, Massachusetts, and St. Louis, Missouri.

MAGMETCO CRIMSON AND GOLDEN ANTIMONY.

The Magnolia Metal Co., 115 Bank street, New York City, manufacturer of the well-known Magnolia babbitt metal, is now manufacturing both crimson and golden sulphuret of antimony for the rubber trade. These products are known as Magmetco brand, 15/17 per cent, and have no free sulphur. The St. George Chemical Co., 99 John street, New York City, is sole selling agent for the United States and Canada.

The Barrett Co., 17 Battery place, New York City, is manufacturing a high grade solvent naphtha suitable for the rubber trade. It is a coal tar distillate of exceptional solvent power. Color, water white; distillation, approximately 5 per cent at 130 degrees C. and 90 per cent at 160 degrees C. The evaporation is slightly faster than turpentine and the flash point about 78 degrees F.

The F. S. Carr Rubber Co. of Canada, Limited, manufacturer of "Victor" rubber heels, mechanical rubber goods and automobile fabrics, has disposed of its business to the Miner Rubber Co., Limited, Granby, Quebec, which will continue to manufacture the same lines of goods, including its own.

THE RAYBESTOS CO.

The Raybestos Co. has been incorporated under the state laws of Connecticut for \$1,500,000 and will take over the Royal Equipment Co., manufacturer and distributor of Raybestos brake lining, brakes, compressed asbestos sheet packing, etc.

A 15-acre factory site has been purchased along the railroad at Bridgeport, Connecticut, and new buildings will be erected which will double the capacity of the present plant. The single-unit type of construction will be used throughout all the buildings, and plans and specifications have been finished for the following additions: Two buildings of concrete and steel, each 100 by 600 feet, to be used for the weaving of brake lining; one building, 100 by 200 feet, for the manufacture of brakes; one, 60 by 200 feet, for the treating of Raybestos; one, 60 by 300 feet, for manufacturing compressed sheet, and one, 60 by 300 feet, for the storehouse and shipping department. A power house and office building will also be erected.

The yearly production of Raybestos brake lining is now 15,000,000 feet, and of compressed asbestos sheet packing, 1,000,000 pounds.

SAFETY FIRST FACTORY SIGNS.

"Safety First" has become a slogan of great significance in all manufacturing plants. The management of the Republic Rubber Co., Youngstown, Ohio, believes in warning workmen to be careful. Signs are placed in various parts of the plant adjuring the employes to use care and caution. Fire boxes are distributed at many points through the premises, and signs are placed pointing the way to the nearest one. A significant sign tells the possible effects of a fire, others placed on stairs admonish employes to go slowly to prevent crashes, while still others illustrate the effective way in which an effort is being made to instil in the minds of the workmen the advantages of care and caution for health, safety and prosperity.

RUBBER COMPANY DIVIDENDS.

The Federal Rubber Co. paid the regular dividend of \$1.75 per share on second preferred stock on November 25.

The directors of the Plymouth Rubber Co. have declared the regular quarterly dividend of 1¾ per cent on preferred stock, payable December 1.

The Ajax Rubber Co., Inc., has declared a quarterly dividend of \$1.25 per share, payable December 15 to stockholders of record November 29.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on November 25, are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	70	72
Easton Tire & Rubber Co. (new), common.....	168	171
Easton Tire & Rubber Co., preferred.....	106	108

Samahart Tire & Rubber Co.....	85	86
U. S. Rubber Co., common.....	65¾	66¼
U. S. Rubber Co., preferred.....	112¼	113

TRADE NOTES.

The business of G. E. Thing & Co., Buffalo, New York, has been acquired by the United States Rubber Co., of New York City, and will be continued as a branch store of that company, under the same name as formerly, with J. F. Barnes as manager.

The Orrville Rubber Co., Orrville, Ohio, notice of whose incorporation appeared in the November issue of THE INDIA RUBBER WORLD, has begun operations with newly purchased machinery that will insure an output of 360 tires per day. The company will manufacture inner tubes and tires, specializing in Ford sizes, and about January 1 will commence to manufacture heels, soles and rubber matting.

The Panama Rubber & Equipment Co., St. Louis, Missouri, has increased its capital stock to \$30,000. This company has recently added to its automobile business a lighting and starting battery station, managed by H. E. Spoeneman, who has become a member of the firm.

Rosenwald & Weil, Chicago, Illinois, have more than doubled their rubberizing capacity within the past year and have recently contracted to produce 1,000,000 yards of auto-top combining work. This concern is now running a new 66-inch, three-roll Farrel calender, and in order to secure the proper control over the variable speeds, a transformer and rotary converter has been installed in connection with a Cutler-Hammer control board.

This firm recently held an extensive exhibit at their sample rooms for the information of raincoat buyers. Crude rubbers of various kinds were shown, together with bottles or jars of compounding ingredients, each properly labeled. With these were displayed samples of the fabrics before and after sheeting, all appropriately labeled. The exhibit elicited much favorable comment from the buyers.

The entire plant of the Atlantic Manufacturing Co., mechanical rubber goods, at Wilmington, Delaware, was consumed by fire on November 7. It is said that the plant will at once be rebuilt.

The Barrett Co., Philadelphia, Pennsylvania, a large manufacturer of chemicals and compounding ingredients used in the rubber trade, specializing in benzol, will build a one-story brick and concrete boiler plant on Bermuda street.

The United States Rubber Co. of California, will occupy a new \$10,000 building now in course of construction at 731 Broadway, Tacoma, Washington. The new quarters will be 40 by 100 feet, three stories high.

The New York City offices of Werner & Pfleiderer Co., of Saginaw, Michigan, are now located on the thirty-seventh floor of the Woolworth Building.

The capital stock of the Portland Rubber Mills, of Portland, Oregon, has been increased from \$25,000 to \$40,000, according to an announcement made by H. C. Huntington, president and general manager of the mills. The company specializes in molded goods.

It is reported that Robert H. Childs, superintendent of the Asphalt & Rubber Co., Independence, Kansas, has resigned and will be succeeded by J. H. Harre, of Chicago, Illinois.

The recent annual meeting of the Electric Hose & Rubber Co., Wilmington, Delaware, showed a gross business of \$1,468,000, as compared with \$991,000 during the preceding year. Total dividends for the year amounted to 15 per cent.

The new mechanical rubber goods manufacturing company located at Goshen, Indiana, will be known as The Goshen Rubber & Manufacturing Co. The new company was incorporated with a capital of \$55,000 and its officers are Charles Noel, president, general manager and treasurer, and Henry W. Pease, secretary, sales manager and superintendent.

Large additions are being made to the La Crosse Rubber Mills, La Crosse, Wisconsin. Present plans embrace a largely increased force and output of rubber boots and shoes.

The Meade Rubber Co., Stoughton, Massachusetts, manufacturer of molded specialties, is working its factory day and night and is unable to keep abreast of orders.

The United States Rubber Co., Lycoming, Pennsylvania, will erect a four-story addition to its plant costing \$40,000. The completion of this will allow for an increase in force of 500 to 1,200 persons, and in production to 20,000 pairs of shoes daily.

PERSONAL MENTION.

The whole trade will hear with much regret of the accident that happened to Robert B. Baird, vice-president of the Rubber Trading Co., on the 14th of November. Mr. Baird, in crossing lower Broadway, New York City, was struck by a car and badly crushed under the fender. He was taken to the Seeneey Hospital in Brooklyn, where he has remained in an unconscious condition most of the time since. His injuries seem to be shock and a slight concussion of the brain. The physicians in attendance report that his condition is very serious.

Marcus Rothschild, who has been connected with the Rubber Trading Co., New York City, since its organization, has commenced business on his own account as a crude rubber broker, with offices at 23 Beaver street, New York City.

Captain Ernest E. Buckleton, president of the Northwestern Rubber Co., Litherland, Liverpool, England, has recently been visiting his many friends in the United States and Canada. Captain Buckleton is hale, hearty and optimistic as usual, and if he returns to England early in December, as he now plans, the American rubber trade heartily wishes him *bon voyage*.

Frederick C. Peck, author of "The Valuation of Rubber Estates" and "Malayan Dollar Companies," and late director of The Mergui Rubber Estates, Limited, Lower Burma, passed through New York last month *en route* to England. He reports a very bright future for the Eastern planting industry.

Edgar B. Davis and H. Stuart Hotchkiss have returned from Sumatra, where they inspected the plantations of the General Rubber Co., of New York City.

J. M. S. Carroll, manager Quebec division Canadian Consolidated Rubber Co., Limited, has been elected by acclamation a director on the board of management of the Dominion Commercial Travellers' Association, to hold office for the years 1917-1918.

W. F. Bowers, founder of the Bowers Rubber Works, San Francisco, California, was a recent visitor at the offices of THE INDIA RUBBER WORLD in New York City. His interests, by the way, in the very successful company that he built up, he sold to his partner, W. R. Johnson.

Leon A. Mainetty has brought suit against George Philips Neider, a New York export merchant, alleging that Neider caused his name to be placed on the British blacklist by inducing him to ship contraband rubber in coffee bags.

"TAPERED" RUBBER WASHERS.

A rubber washer is a simple thing, usually a piece of sheet rubber cut to the shape and size intended. It performs its work well under ordinary circumstances. But if the seat against which it rests be worn or uneven, the washer must be subjected to unusual grinding pressure to secure the necessary tightness, and its early destruction results. A washer that will be fully as effective where the connections are perfect, and much more so where the above-named defects are manifest, has a somewhat spherical surface on one side—a sort of rounded taper. This shape allows the taper to fit uneven surfaces more closely. These washers are made of a flexible compound that renders them more durable and efficient. [The Durst Manufacturing Co., Inc., New York City.]

F. E. PARTRIDGE HEADS NEW RUBBER FIRM IN CANADA.

F. E. PARTRIDGE, president of the recently established rubber manufacturing corporation bearing his name, has been identified with the rubber industry for over 20 years. He started

F. E. PARTRIDGE.

in 1894 with the Maynard Rubber Co., Claremont, New Hampshire, and rose step by step to the position of superintendent. From there he went to the Boston Woven Hose and Rubber Co., Cambridge, Massachusetts, as night superintendent. His next step was to the superintendency of the plant of the Combination Rubber Co., Bloomfield, New Jersey. Later he was called to the

Canadian Rubber Co., Montreal, Canada, where he was made vice-president, and given the management of the production of all goods made by that company, with the exception of footwear.

Early in 1915 Mr. Partridge formed a partnership with Vincent Cooke for the purpose of manufacturing druggists' sundries and inner tubes, and worked up business to such an extent as to demand a much larger plant. At the opportune moment, the Independent Rubber Co., Merriton, Ontario, Canada, discontinued business, and the plant, valued at \$175,000, was leased by the F. E. Partridge Rubber Co. for a term of years, with an option to purchase on advantageous terms.

A new company was formed, with headquarters at Guelph, Ontario, Canada, under the above corporate name, with a capital of \$125,000. Mr. Partridge is president and general manager. Associated with him are Vincent Cooke, vice-president, and F. M. Ker, secretary and treasurer. The factory is now turning out tires and tubes, hot water bottles, and a varied line of druggists' sundries, while alterations are being made and extra equipment installed to enlarge further the variety and quantity of the output.

BERGOUGNAN TIRE CORPORATION.

After December 11, 1916, the Gaulois Tire Corporation, 49 West Sixty-fourth street, New York City, American sales agents for Établissements Bergougnan, Clermont-Ferrand, France, will change its name to Bergougnan Tire Corporation. J. Grenier will continue as vice-president and general manager.

NEW CANADIAN TIRE COMPANY.

The Sterns Tire & Tube Co. of Canada, Limited, has been formed with an authorized capital of \$1,000,000, and will locate at Windsor, Ontario, with a one-story factory, 100 by 150 feet. The officers of the company include N. J. Morrissey, Pickering, Ontario, president; Edward Sterns, St. Louis, Missouri, director and consulting engineer; C. J. Gibson and A. S. Chapin, Toronto, directors; E. M. Carruthers, Toronto, secretary and treasurer.

PERSONAL MENTION.

Carl P. Cartmell will handle the sales of Kelly-Springfield tires in the Buffalo (New York) territory for the Kelly-Springfield Tire Co., New York City. Mr. Cartmell was formerly treasurer and purchasing agent for the Victor Rubber Co., Springfield, Ohio, but has disposed of his interest in that company.

A. L. Edwards, son of George D. Edwards, notice of whose death appeared in the November issue of THE INDIA RUBBER WORLD, has succeeded his late father as manager of the Detroit (Michigan) branch of the Kelly-Springfield Tire Co.

J. P. Carney, for the past 20 years associated with the Portland (Oregon) branch of the Goodyear Tire & Rubber Co., has now joined the forces of the Imperial Belting Co., of Chicago, Illinois, having charge of the Northwest territory of the latter company, with headquarters in Portland.

Horace De Lisser, chairman of the board of directors of the Ajax Rubber Co., New York City, recently went to Cuba for a several weeks' trip combining business and pleasure.

Leland J. Sparks has been appointed manager of the Portland (Oregon) branch of the Firestone Tire & Rubber Co., having formerly been connected with the branch at San Francisco, California.

William L. Burgess has been appointed sales manager of the Sterns Tire & Tube Co., St. Louis, Missouri. For the past two years Mr. Burgess was general sales manager of the Dorris Motor Car Co. and prior to that had charge of the sales of the rim department of the Firestone Tire & Rubber Co.

H. S. Wheeler has succeeded H. T. Richards as manager of the Memphis (Tennessee) depot of the B. F. Goodrich Co.

A. E. Hertzog, manager of the Baltimore branch of the Goodyear Tire & Rubber Co., Akron, Ohio, has been appointed manager of the Washington branch of the company and will take care of the territory in both sections. L. J. Gemmil, who was manager of the Washington branch, will look after all of the government business exclusively.

S. P. Woodard is now president of the Gillette Safety Tire Co., Eau Claire, Wisconsin, and will have offices in New York City.

It was recently announced that Ralph C. Ridge, former superintendent of the Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, has succeeded C. F. Pickton as superintendent of the Porter Rubber Co., of Salem, Ohio.

Fred E. Boylan has resigned as Detroit manager of the Swinehart Tire & Rubber Co., Akron, Ohio, to become factory representative of the Sewell Cushion Wheel Co., Detroit, Michigan.

EXPANSION OF THE EAST PALESTINE RUBBER CO.

The East Palestine Rubber Co., Pittsburgh, Pennsylvania, with a factory at East Palestine, Ohio, has acquired additional property of about 12 acres, adjoining the present plant and lying directly upon the main line of the Pennsylvania Railroad, with a railroad frontage of 1,800 feet. This land has been purchased for enlargements and additions to be erected in the immediate future. These improvements will be of single unit type, one story, saw tooth, brick, steel and glass construction. The buildings are to be equipped with the latest type of tire and tube making machinery and will quadruple the present manufacturing capacity.

On completion of the first unit, the construction of the company's "Nabob" tire will be changed from the wrapped tread to the full mold type, but the tire will remain a strictly hand-made product. As soon as the necessary special equipment is obtained, the company also intends to manufacture a cord tire.

TRADE NOTES.

The Reliable Tire & Rubber Co. of New England has changed its name to Interstate Rubber Co. and has removed its Boston (Massachusetts) office to 392-394 Newbury street. This change of name was considered advisable by the stockholders because the company distributes more than one brand of automobile tires.

The Armstrong Rubber Co., Inc., having removed its factory to 118-122 Adams street, Newark, has discontinued its corporation in the State of New York and incorporated in the State of New Jersey for the same amount, \$200,000. This company manufactures the well-known Armstrong tube equipped with the Kahn automatic valve.

The F. E. Partridge Co., Limited, notice of whose incorporation appears elsewhere in this issue, has taken over the plant and equipment of the Standard Tire & Rubber Co. of Guelph, Ontario, on a five-year lease, with option of purchase at any time before its termination. The head office of the Partridge company has been moved to Guelph and orders taxing the full capacity of the plant have already been secured. The output consists of high-grade tires, tubes, and druggists' sundries.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has begun the erection of a boiler plant, 125 by 300 feet, which will include, besides the boiler house, a railroad trestle, coal crusher, automatic conveyors and feeders, with other auxiliary apparatus. The first installation will consist of five 760-horse-power boilers. The building will provide steam and hot water for manufacturing purposes throughout the 20 buildings of the company, and the cost of the entire project will be over \$200,000.

Charles F. U. Kelly, president of the Kelly-Field Co., the selling corporation for the Lee Tire & Rubber Co., of Conshohocken, Pennsylvania, has sold his entire interests to Harry E. Field, who has been vice-president and treasurer, and who now becomes president of the company. The business will be continued unchanged except that even closer relations with the factory will be established and a considerable addition made to the selling forces to care for the increased production that is planned for the coming year. Mr. Kelly has not yet announced his future plans.

The East Palestine Rubber Co., East Palestine, Ohio, has increased its capital from \$500,000 to \$1,000,000.

The Connecticut Mills Co. is building a 400-foot, four-story addition to its weaving mill at Danielson, which will make the mill 850 feet in length. A model village is also being erected, and around the mill proper is an exceptionally fine park with extensive lawns, shaded drives and beautiful gardens. The spinning plant of this company is at Taunton, Massachusetts. R. J. Caldwell Co., Inc., 15 Park Row, New York City, is the selling agent.

The Standard Tire & Rubber Manufacturing Co., with offices in Cleveland, Ohio, and factory at Willoughby, Ohio, has completed material additions in floor space and equipment to take care of increased production. About six months ago this company was producing 50 tires a day, but this output has been increased to 200 a day, and the present expansion has been made in order at least to double that capacity.

The Standard Four Tire Co., Keokuk, Iowa, has increased its capital stock from \$240,000 to \$340,000, \$300,000 being preferred and \$40,000 common stock.

The Sheldon Tire Co., Buffalo, New York, notice of whose incorporation appears elsewhere in this issue, was organized to succeed the Quality Tire Co., which is the agency for Hood tires in western New York.

The Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, has recently received an order for 70 hydraulic vulcanizing presses of 115-ton rating from the Goodyear Tire &

Rubber Co., Akron, Ohio. All of the presses are of one design and will be operated from the hydraulic pump and accumulator systems already installed.

The Crown Tire & Rubber Co., recently incorporated for \$250,000, will locate in Omaha, Nebraska, and will specialize in Crown Cord tires for automobiles and motorcycles. Other lines of rubber goods will also be made. The company is said to have acquired five acres of ground for the projected plant, which will comprise six large factory buildings, when completed.

The Luck Tire & Rubber Co. is a new enterprise expected to locate in Hillsdale, Michigan. It is stated that C. J. Davis, of the National Tire & Rubber Co., East Palestine, Ohio, will be manager of the new plant.

In support of their statement that Dann Inserts between the leaves of automobile springs will promote appreciably the life of automobile tires, the Poehlmann Automobile Supply Co., Baltimore, Maryland, offers to add 1,500 miles to the mileage guaranty offered by the tire manufacturer. To obtain the benefit of this arrangement, the automobile owner has only to register with the Poehlmann Co. any new tires which he places on a car equipped with the inserts.

The McGraw Tire & Rubber Co., East Palestine, Ohio, recently turned out 5,324 tires in one day. It is expected that with the installation of certain machinery this figure will soon be greatly exceeded.

Work has been resumed on the Pearce Tire & Rubber Co., Ashtabula, Ohio. It is stated that Cleveland capital has recently become interested in the project.

The Good-Wear Tire Co., which seemed likely to locate in Lorain, Ohio, has decided to operate in Elyria, Ohio, and to that end has purchased a factory in that city.

The Firestone Tire & Rubber Co. contemplates a branch house in Wichita, Kansas.

The Germantown Pennsylvania factory of the Pearce-Arrow Tire & Rubber Manufacturing Co. is turning out a pneumatic tire with a claimed mileage capacity test of 10,000 to 12,000 miles. This company puts out the Pearce "custom-made" 4,200-mile guaranty tire.

The Boone Tire & Rubber Co. will locate at Sycamore, Illinois. The company is expected to be in operation in February.

The V. K. Sturgis factory, at Oakland, California, has taken the operating name of the National Rubber Co. It is said this company will employ 100 men.

The Achilles Rubber & Tire Co., notice of whose incorporation appears elsewhere in this issue, has recently purchased a factory site in Binghamton, New York. The company purposes to manufacture tires.

The Knight Tire & Rubber Co., Canton, Ohio, has been absorbed by the Fabricord Tire Co., which is being formed for the purpose of welding into one great organization several rubber manufacturing units. N. W. McLeod, of St. Louis, Missouri, is president of the Fabricord company, and particular attention will be devoted to the production of cord tires under the McLeod patents. It is said that capitalists of New York, Chicago and St. Louis are interested.

THE BIG FOUR TIRE & RUBBER CO.

The present factory at Berea, Ohio, of the Big Four Tire & Rubber Co., notice of whose incorporation appears elsewhere in this issue, has 18,000 feet of floor space and is situated on a 5½-acre tract of land.

The company is now selecting a site in Cleveland, Ohio, for a new factory, and in the near future will erect there a concrete building 400 feet long by 80 feet wide, three stories and basement. While tires will be the main output, a general line of rubber products will also be manufactured.

KELLY-SPRINGFIELD PLANS FOR CUMBERLAND PLANT.

The future location of the Kelly-Springfield Tire Co., in Cumberland, Maryland, is now an established fact, a site for the new plant having been acquired on a 74-acre tract of land. The factory will be of four-story wing construction, thoroughly modern in every respect, facilities of the most approved sort being provided both as to manufacture and welfare of workers.

A \$500,000 bond issue, voted by the city of Cumberland, provides for necessary civic improvements in the section where the plant is to be located. The Kelly-Springfield company in turn agrees to erect a plant costing at least \$1,500,000, and within two years after it is in full operation to employ at least 3,000 persons. Within one year after full completion of the Cumberland factory, the Kelly-Springfield company will discontinue all other plants and concentrate its entire manufacturing business in Cumberland.

A CHANGE OF NAME.

At a stockholders' meeting of the Vail Rubber Co., November 2, the name of the corporation was changed to Ehman Tire & Rubber Co. The Ehman company will continue to manufacture and sell pneumatic tires for automobiles and accessories to the tire lines, also mechanical rubber goods. Considerable additional equipment is now being installed to take care of rapidly increasing demands.

GORDON TIRE PROGRESS.

The new storehouse and shipping room now under construction for the Gordon Tire & Rubber Co., Canton, Ohio, will relieve 6,000 square feet of space in the mill room, thereby increasing efficiency and output considerably.

Several changes in the personnel of the operating-department also indicate the rapid expansion of the business. C. W. McKone, chief chemist of the Ajax Rubber Co., Trenton, New Jersey, will hereafter be mill room superintendent. E. R. Neubauer, of the Star Rubber Co., Akron, Ohio, has been appointed manager of sales of the druggists' sundries department, and E. R. Palmer, of the American Tire & Rubber Co., Mansfield, Ohio, has assumed the duties of chief of the cost department.

HYDRAULIC PRESS MANUFACTURING CO. EXPANDS.

The increased demand for their hydraulic presses, pumps, valves, accumulators and intensifiers, has led to the completion of plans for extensive plant and equipment improvements in the factory of the Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, builder of vulcanizing presses. To relieve the crowded condition of the machine shop an addition 100 feet long by 60 feet wide will be erected and considerable new machine shop equipment will be needed, including a 20-ton electric traveling crane, a large motor-driven horizontal boring mill and a heavy-duty motor-driven planer.

A 20-foot extension will be added to the present power plant building and new equipment will be installed, consisting of a 300-horse-power Corliss engine and a 225-K-W generator. Two new steam boilers and stokers for three boilers will be added to the present boiler equipment. A building for oil storage will also be erected, the main stock room will be extended and another story added, giving additional space for the storage of small parts; the tool room will be enlarged and a new structural shop about 50 by 60 feet erected.

The plans also include an extension of the present erecting shop building, measuring 47 by 130 feet. For all of the building extensions brick and concrete construction with steel for the substructure will be used. All of the above improvements, except the last named, will be made immediately.

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

SAVAGE TIRES IN MICHIGAN.

The Savage Tire Corporation, of San Diego, California, has recently opened a Michigan office under the name of the Michigan Savage Tire Sales Co., with S. E. Straight as branch manager, and headquarters at 429 Grand avenue, Detroit. A \$200,000 stock is carried, and will be increased as needed. Seventy sub-branches have already been opened in various parts of the city and state.

NEW CLUBHOUSE FOR McGRAW EMPLOYEES.

A recent campaign among employes of The McGraw Tire & Rubber Co., East Palestine, Ohio, to raise funds for a clubhouse resulted in subscriptions amounting to nearly \$2,000. The company has now appropriated \$10,000 additional as its donation, and plans have been prepared for the erection of the clubhouse on East Taggart street. The building will be two stories high in the front portion, the dimensions being 50 by 110 feet, exclusive of verandas. Every possible provision for the comfort and enjoyment of the employes will be made, including four bowling alleys in the basement, four or five pool tables, one billiard table, a barber shop, toilets, lockers and 15 or 20 baths, the latter being placed conveniently at the foot of a stairway leading from the gymnasium, 50 by 70 feet, at the rear of the main floor. This gymnasium will have a balcony around three sides. At the front, on the main floor, will be a large lounge, with a six-foot open fireplace, a library and music room, a cloak room, and committee room. The second floor of the front portion of the building will be devoted entirely to a well-equipped kitchen and dining room for use on special occasions.

RACINE AUTO-TIRE CO. TO BUILD.

The Racine Auto-Tire Co., Racine, Wisconsin, has recently purchased a four-acre tract of land, known as the Wisconsin-Illinois baseball park, on which a modern plant will be erected in the spring. The new plant will have a capacity of 1,000 tires per day and will be built so that this may be greatly increased by adding to the units. Machinery has already been ordered from the Farrel Foundry & Machine Co., and electrical equipment from the Westinghouse Electric & Manufacturing Co.

The Racine company is running its present plant night and day, to its full capacity of approximately 250 tires and tubes per day.

THE TWIN RIM.

It is rather a clever idea that is embodied in this new and practical first aid device for tire troubles and which is really a modified form of a spare wheel. It comprises a rim of the

ordinary demountable type to which are riveted four lugs that are provided with slots for the fastening bolts. These are four specially formed clamps that fit over the inside of the felly and slip into the slots of the rim lugs. In case of a puncture or blow-out in either front or rear wheel the twin rim with the inflated tire upon it is placed beside the damaged tire, the clamps fitted in place, and by tightening the four bolts with a special wrench

provided for that purpose the car is ready to run any distance. It is claimed that this complete device weighs only one-fifth that of other demountable rims and can be attached in 5 minutes. [Twin Rim Co., Boston, Massachusetts.]

NEW INCORPORATIONS.

A. B. & S. Cement & Rubber Co., October 13 (Massachusetts), \$10,000. Arthur B. Alden, Brockton, Massachusetts; Daniel C. Smith, Morris A. Smith, George H. Bixby, William E. Bixby, and Charles H. Poor—all of Haverhill, Massachusetts. Principal office, Haverhill, Massachusetts. To manufacture and sell rubber cement, etc.

Achilles Rubber & Tire Co., October 19 (Delaware), \$1,000,000. E. Von Vargyas; Lawrence A. O'Dea and Lorenzo G. Warfield all of Washington, D. C. Principal office, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To acquire lands and buildings in New York or elsewhere for the purpose of manufacturing rubber tires and other articles of like nature.

Aeromarine Engineering & Sales Co., Inc., November 3 (New York), \$1,000. M. L. Weiland, 233 Broadway, New York City; Arthur H. Slack, 258 Lefferts avenue, and Henry Amerman, 439 Quincy street—both in Brooklyn, New York. To manufacture balloons, aeros, motors, etc.

American Chicle Co. of New York, Inc., October 25 (New York), \$10,000. Thomas Adams, 763 Fifth avenue; John D. Adams, 1 West 72nd street—both in New York City, and Horatio M. Adams, Glen Cove, New York.

Beach, Knowles & Hill, Inc., November 3 (New York), \$25,000. Charles S. Beach, 605 West 137th street; Paul H. Knowles and Luigi Solari, 205 West 89th street—both in New York City. To deal in auto parts and accessories, etc.

Big Four Tire & Rubber Co., The, September 5 (Delaware), \$1,000,000. G. H. Ritchie (president), 280 Miles avenue; B. Wingerter, (vice-president), South Howard street; Dr. C. C. Spangler (secretary), 17 South Howard avenue, and O. P. Lamuel (director), Adams street—all in Akron, Ohio, and W. E. Wingerter (treasurer), 736 Guardian Building, Cleveland, Ohio. Principal office, 736 Guardian Building, Cleveland, Ohio. To manufacture and deal in tires and other rubber goods.

Christman Tire Co., Inc., November 13 (New York), \$2,000. Jacob K. Christman, 247 Post avenue; Arthur A. W. Brewster, 569 Plymouth avenue, and Clayton R. Brown, East Rochester—all in Rochester, New York. Principal office, Rochester, New York. Auto tires, etc.

Columbia Scrap Rubber Co., November 1 (New Jersey), \$50,000. Yvette Gordon, Louise De Piano, Frank De Piano, Joseph Gordon, Antonio De Piano—all of Trenton, New Jersey. To import, buy, sell and deal in scrap rubber, etc.

Crown Tire & Rubber Co., October 4 (Nebraska), \$250,000. Henry A. Reichenbach, Omaha, Nebraska; Henry C. Meier, Council Bluffs, and Jesse P. Howe, Des Moines—both in Iowa. Principal office, Omaha, Nebraska. To manufacture and sell, wholesale, automobile tires and other rubber goods.

Deltire Rubber Co., November 9 (New Jersey), \$25,000. Alexander Trapp; John R. D. Bower and Catherine Pippel Hornyak—all of Trenton, New Jersey. To manufacture and deal in rubber goods, etc.

Ehman Tire & Rubber Co., November 8 (Illinois), \$150,000. A. C. Ehman (president), Francis Lackner (vice-president), M. J. Flynn (treasurer), Judge Jesse Holdom, W. A. Vail and A. B. Larkin. Principal office, La Salle and Twenty-seventh streets, Chicago, Illinois. To manufacture automobile tires and mechanical rubber goods.

Elkland Tanning Co., November 16 (Maine), \$100,000. G. L. King (president), 71 West street; A. E. Pierce (treasurer), 23 Noyes street, and Charles L. Donahue (clerk), 277 Congress street—all in Portland, Maine. To manufacture and deal in rubber, etc.

Elliot Rim Chain and Tread Corporation, October 31 (New York), \$100,000. D. Kern Einfurer, 1491 East Tenth street; Walter L. Perley, 1009 Lincoln Place, and Joseph J. Miller, 310

St. Johns Place—all in Brooklyn, New York. Principal office, Esopus, New York. Auto parts and accessories.

Englewood Tire & Supply Co., November 4 (Illinois), \$5,000. F. F. Symonds, John H. Cadmus, and Oliver H. Starrett. Principal office, 501 West Garfield Building, Chicago, Illinois.

Fox-Senior Tire Co., July 15 (Connecticut), \$25,000. C. S. Fox, T. R. Senior, C. M. Fox and S. P. Senior—all of Bridgeport, Connecticut. Principal office, 357 Fairfield avenue, Bridgeport, Connecticut.

Globe Auto Accessories Co., Inc., October 23 (New York), \$500. William F. Watters (president), 26 Plymouth avenue, South; S. X. Newman (vice-president and sales manager), 453 Seneca Park Way, and F. B. Ræ (secretary and treasurer), Ambrose street—all in Rochester, New York. Principal office, Ambrose street, Rochester, New York. To sell tires, tubes, etc.

Good-Wear Rubber Co., The, September 21 (Ohio), \$500,000. W. E. Deve (President), H. B. Kishman and A. E. Beckel, Vermilion; Jacob E. Murbach, (vice-president), Walter E. Brooks, (treasurer), Elyria; J. J. Dauch, Sandusky; William Scher, and L. S. Grimm, Lorain—all in Ohio. Principal office, Suite 307, Masonic Temple, Elyria, Ohio. Manufacturer of tires, tubes, and rubber sundries.

Grossman, Emil, Manufacturing Corporation, November 8 (New York), \$410,000. Harry Radzinsky and Julius Bregman, 233 Broadway, New York City, and Reuben Stern, 109 Walton street, Brooklyn, N. Y. Auto parts and accessories.

Keystone Rubber Co., October 16 (New Jersey), \$25,000. Harry Johnson, Yardville; Albert Hughes and Richard M. J. Smith, Trenton—both in New Jersey. Principal office, Yardville, Mercer County, New Jersey. To purchase, buy, sell and manufacture soft rubber goods.

Kip Vulcanizing Co., Inc., November 9 (New York), \$1,000. B. Franklin Klass, 523 West 152nd street, William T. Weidenman, 154 West 68th street, and Kenneth A. Palmer, 359 Moshulu Parkway—all in New York City. Repairing tires, etc.

L. P. Ross Co., Inc., November 9 (New York), \$25,000. William H. Porter, 68 Mortimer street, Rochester, New York; Henry B. Hubbard and George H. Mayo—both of 1790 Broadway, New York City. Principal office, Rochester, New York. To deal in rubber goods, etc.

McClure Tire & Rubber Co., September 21 (Ohio), \$15,000. J. A. McClure, Jr. (president); E. Buchanan (vice-president); R. T. McClure (secretary and treasurer); J. P. Eagleson (attorney), 8 East Broad street; and A. M. Howson, 446 West 8th avenue—all in Columbus, Ohio. Principal office, 212-216 East Gay street, Columbus, Ohio. To deal in tires, reliners, blow-out patches, etc.

Minnesota Tire & Rubber Co., September 6 (Minnesota), \$200,000. Harry A. Trenhold, Minneapolis; Nels L. Werner, Red Wing—both in Minnesota, and James W. Adams, Ellsworth, Wisconsin. Principal office, St. Paul, Minnesota. To manufacture and deal in tires, rubber goods and accessories.

Non-Deflating Inner Tube Co., October 24 (Ohio), \$100,000. J. A. Sullivan, Henry Roegge, A. W. Stockman, M. D. Wagner, and John A. Elden, 1325 Williamson Building, Cleveland, Ohio. Principal address, 1325 Williamson Building, Cleveland, Ohio. To manufacture a non-deflating inner tube.

Nu-Way Cure Co., October 6 (Wisconsin), \$20,000. R. C. Moore, 226 Hazel street; Joseph E. Freix, 519 North Broadway street; E. W. Gilsdorf, 414 Fifth street; J. J. Wirtz, 620 East Walnut street, and F. S. Kaup, 1116 Cherry street—all in Green Bay, Wisconsin. Principal office, Green Bay, Brown County, Wisconsin. To manufacture and sell a preparation for the purpose of curing punctures in pneumatic tires and all other automobile accessories.

Partridge, F. E., Rubber Co., Limited, The, September 25 (Dominion of Canada). F. E. Partridge (president), Vincent

Cooke (vice-president), F. M. Ker (secretary-treasurer). Principal office, Guelph, Ontario, Canada. To manufacture tires, tubes and druggists' sundries.

Port Arthur Tire Co., September 19 (Texas), \$2,000. A. F. Hughes, C. M. Dismukes and J. R. Campbell—all of Port Arthur, Texas. Principal office, Port Arthur, Texas. Deal in tires.

Public Service Tire & Rubber Co. of New York, Inc., November 18 (New York), \$100,000. Richard Krause, Clason Point; G. H. Empey, 446 Lexington avenue, and T. A. Anderson, 226 Utica street—both in Brooklyn, New York.

Quick Service Tire Co., Inc., October 24 (Texas), \$5,000. F. Aitken, Alex Feigleson and Charles T. Butler—all of Beaumont, Texas. Principal office, Beaumont, Texas. To deal in tires, tubes, automobile accessories, etc.

Reuter Puncture-Proof Tire & Tube Co., October 6 (New Jersey), \$125,000. George Joseph Reuter, 182 Montclair avenue; Alfred Strauss, 73 Hedden Terrace, and Louis R. Freund, 152 Johnson avenue—all in Newark, and Abraham M. Herman, Pleasantville—both in New Jersey. Principal office, 810 Broad street, Newark, New Jersey. To manufacture, buy, sell, import, export and generally deal in tubes and tires for automobiles, etc.

Runyan Cushion Wheel Co., October 12 (Nebraska), \$100,000. H. O. Wulff, D. R. Sowards, E. J. Conrad, and Fred C. Burlington—all of Omaha, Nebraska. Principal office, Omaha, Nebraska. To manufacture a patent cushion wheel.

Rynehart Rim Tool Co., Inc., November 16 (New York), \$5,000. Henry M. Rynehart, 17 Fulton street, and L. Nissen, 166 DeKalb avenue—both in Brooklyn, New York, and John H. Jansen, 41 Park Row, New York City.

S. & J. Raincoat Co., Inc., The, November 22 (New York), \$1,000. Solomon Blickman, 38 Montgomery street, Joseph Golombeck, 38 Suffolk street—both in New York City, and Harry P. Sweetgold, 161 Kosciusko street, Brooklyn, New York. To manufacture waterproof clothing, etc.

San Francisco Tire Co., Inc., November 3 (New York), \$6,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, New York. Tire manufacturing business.

Selum Manufacturing Corporation, The, November 13 (New York), \$100,000. Stephen Oderwald and Rose A. Chenska, 231 Elm street, Astoria, New York, and Henry M. DeSulykowsky, 61 West 61st street, New York City. To manufacture Se-Lum and other auto supplies.

Schwab Improved Tire Co., October 10 (Minnesota), \$50,000. John Schwab, Martin Schwab and William H. Ellinger—all of Minneapolis, Minnesota. Principal office, Minneapolis, Minnesota. To manufacture improved automobile and vehicle tires, parts and accessories.

Sheldon Tire Co., Inc., November 8 (New York), \$1,000. Burton K. Sheldon, Charles Kuhn and Cleveland Pond—all of Buffalo, New York. Principal office, Buffalo, New York. To deal in auto tires.

Springfield Tire Service Co., September 14 (Illinois), \$5,000. Edward G. Mitts, Philip Stewart, and L. L. Bingham. Principal office, 303 South Fourth street, Springfield, Illinois. To handle and sell automobile tires and accessories, etc.

Standard Tire & Rubber Manufacturing Co., The, April 4 (Washington), \$500,000. Max Freed, Edward P. Fick, Ivan Bushong, R. Freed and F. N. Rhodes. Principal office, Seattle, Washington. To sell rubber tires and goods.

Stearns Rubber Co., October 20 (New Hampshire), \$15,000. William A. Pressey (president), Hampton Falls, and William F. Stearns (secretary and treasurer), Exeter—both in New Hamp-

shire. To take over the business of The Rubber Step Manufacturing Co., Exeter, Ohio, manufacturers of automobile tubes, rubber covered steps and pedals, and mechanical rubber goods and specialties.

Superior Rubber Co., Inc., October 23 (New York), \$25,000. George J. Hagimaier, Pittsburgh, Pennsylvania; Elmer W. Hagimaier and Joseph Porzell, Buffalo, New York. Principal office, Buffalo, New York.

Syracuse Tire Co., November 1 (New York), \$10,000. Sydney Bernheim, 35 Nassau street, New York City; Catherine A. Weldon, 591 Seventh street, and Harry H. Jacobson, 555 Grand street—both in Brooklyn, New York. To manufacture tires.

Tropical Tire & Rubber Co., Inc., November 16 (New York), \$25,000. William W. Thomas, Alfred M. Lazarowitz, and Abraham Solomon—all of 51 Leonard street, New York City.

Twin River Rubber Works, Inc., November 22 (New York), \$100,000. Julius Schmid and Charles F. Schmid, 470 Fourth avenue, New York City, and Paul Henkel, West Nutley, New Jersey. To manufacture rubber goods of all kinds.

Van der Linde Rubber Co., Ltd., October 26 (Dominion of Canada), \$350,000. Harold van der Linde (president), H. C. Scholfield (vice-president), and T. D. Bailey (secretary and treasurer). Principal office, 142 Weston Road, Toronto, Ontario, Canada. To manufacture and deal in tires, tubes, packing, and general molded goods.

Washington Rubber Co., October 2 (Delaware), \$50,000. Charles D. Cugle, Kenneth W. Cugle, Howard C. Newcomer, William J. Hart—all of Washington, D. C. Principal office, Delaware Charter Guarantee & Trust Co., 328 duPont Building, Wilmington, Delaware. To produce, buy, sell and deal in rubber and the articles and goods of all kinds of which rubber is a component part.

THE "EVER-WARM" SAFETY SUIT.

Recently a practical test was made in the Atlantic Ocean near Manhattan, just west of the West Banks light, of the Youngren life preserver. Thirteen demonstrators, three of whom were girls, clothed in "Ever-Warm-Safety-Suits," as they are called, leaped into the ocean, one after the other, from a steamer while under way. The illustration shows them grouped together, each supported in an upright position, warm and dry, waiting to be

rescued. This device was illustrated and described in THE INDIA RUBBER WORLD, November 1, 1915. [National Life Preserver Co., Inc., New York City.]

In a 28-room apartment in New York City renting for \$30,000 a year, the kitchen, pantries and service rooms are floored with blue and white rubber blocks.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber sole industry received a good boost at the monthly banquet of the Boston Boot and Shoe Club, when Ex-President Donovan, who is a leading manufacturer of men's shoes, declared that the present high prices of sole leather had led shoe manufacturers to substitute rubber and composition soles in some of their lines, and that experience had proved them to give better service than ordinary sole leather. Makers of this class of goods are receiving heavy orders, and leading shoe manufacturers are among their best customers. These composition soles are made of rubber in combination with other materials, added to give increased wear, and to prevent slipping. Leather cuttings, ground to a fibrous state, are used largely for this purpose, but cotton and flax fibers are also among the materials employed.

* * *

But high prices are not confined to sole leather. Furniture and upholstery leathers, carriage and automobile leathers are all so expensive as to be almost prohibitive, and artificial leather is coming into use much faster in consequence.

Until recently attempts to produce an artificial leather to be used in shoe uppers have not been successful. A new material, made by the Reading Rubber Manufacturing Co., is already being used in considerable amounts for shoe topping. This is a coated fabric, closely resembling matcalf or gun-metal calf in appearance and texture. While it has not yet been used extensively in vamps, some manufacturers of infants' shoes are employing it for the entire uppers. The sales, through L. C. Chase & Co., of Boston, already exceed 100,000 yards.

* * *

The Boston Woven Hose & Rubber Co. is adding still another building to its great plant at Cambridge. Like those recently completed, it is of reinforced concrete, comprises four stories and basement, and measures 65 by 324 feet. It will be used for the friction tape, coated fabric and molded goods departments. It stands on the site of the old friction tape department, and to avoid any stoppage of maximum output was built complete to the roof one half at a time. When all the alterations and contemplated additions to this plant are completed, it will be one of the finest and most up-to-date rubber manufacturing establishments in the country.

* * *

The Converse Rubber Shoe Co. has just completed enlargements to its factory and shipping departments which more than double its floor area and producing capacity. Much of the new space is already occupied, but because of delays in receiving machinery, the full benefit of this extension has not yet become available. A gravity conveyor has been installed, also another motor, and new mixers and calenders will be added. Rest rooms and a restaurant have been established, while every department is being extended and enlarged to take care of increased business. The storehouse and shipping department, in an entirely separate building, have also been nearly doubled in size, giving additional facilities for carrying a much larger stock. To this building runs a railroad siding, for direct receipt of raw material and shipment of finished goods. The manufacture of tires is carried on in a separate building, which will be brought up to present requirements as soon as the footwear factory is in full running order. The present capacity of the latter factory is now 15,000 pairs of shoes daily.

* * *

Wilbur N. Shelton has been appointed general manager of the L. J. Muttly Co., 175 Congress street, Boston, manufacturer of fabrics for the automobile, and tubing for automatic piano players, in which it has developed a large business. After completing his education, Mr. Shelton entered the employ of the

Conant Rubber Co., of Hartford, Connecticut, and rose to the position of salesman in southern New England. For 23 years he was connected with the Franklin Rubber Co., Malden, Massachusetts, and for the last 10 or 12 years has been its general sales manager, visiting the large customers of this company in the principal western cities. Thus he brings to his new position an experience of great practical value. W. S. Osborne, formerly connected with the Boston Safe Deposit Co., is now with the L. J. Muttly Co. as assistant treasurer, succeeding F. H. Brown, who has retired.

* * *

A new hospital has recently been installed at the factory of the American Rubber Co., East Cambridge. It is situated at about the center of the large group of buildings, and on the ground floor conveniently near the calender and mill rooms, where the most serious accidents are likely to occur. There are two intercommunicating rooms, one used as a hospital, or first-aid room, the other suitably fitted up as a rest room for the women employes in case of illness or fatigue. The hospital room has hard plaster walls, metal ceiling, and sanitary marbleoid flooring, and is finished throughout in white enamel. The regulation hospital furniture is of white enameled steel, and the room is otherwise equipped with every appliance and material necessary to give immediate treatment in any emergency.

* * *

The Rockland Webbing Co., manufacturer of non-elastic and elastic webbings, at Rockland, Massachusetts, has taken a ten-year lease of the plant of the Victory Webbing Co., at North Abington, and will run both factories, thereby practically doubling the firm's productive capacity. The Victory Webbing Co. has already discontinued business.

* * *

The recently completed garage of the Monatiquot Rubber Works Co., South Braintree, Massachusetts, is a semi-circular brick building located near the main office and adapted for the accommodation of officers' cars as well as commercial trucks. It is of the most modern type, each car stall being provided with a separate door entrance and individually equipped for washing and all maintenance.

An extension to factory building No. 3, now in progress, will soon make available an increased output of the Monatiquot company's products.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

JUST what the tire industry has meant to Akron is shown by the tremendous increase in population and in building. In 15 years it has grown from a town of about 12,000 inhabitants to a great city of primary importance and known to motorists the world over. The building permits issued in 1915 represented an investment of \$6,000,000, and for the first nine months of the present year, \$9,800,000.

Long famed as the "Rubber City," Akron has now qualified as "Ohio's Eight-Hour Town." The Firestone, Goodrich, Goodyear and other rubber factories have recently adopted the eight-hour system, and while the results vary somewhat, general satisfaction is expressed by employers and operatives. The reports range from an increase in cost of production so slight as to be characterized as "about an even break" compared with the ten or twelve-hour work day, to a statement that in certain departments the eight-hour system has effected an 18-per cent increase in production with only a 10-per cent wage increase, while workmen are averaging the same pay per week that they did under the longer hours.

Tire factories are operated mainly by piece work, and in adopting the eight-hour day the rates were readjusted so that the men would receive at least as much money as before. The result

has been increased production and often increased wages together with reduced cost, except in a few departments where the differences are so slight as to be of little consequence. Tire builders average \$4.50 a day as before; the lowest pay is \$2.50 a day for sweepers, and from that up to \$6 a day for heavy work. Quality is insured by rigid inspection and a limit on production where necessary.

The philosophy of this greater efficiency is best explained in the words of H. S. Firestone, president of the Firestone Tire & Rubber Co.: "There is nothing sentimental, paternalistic or philanthropic in our adoption of the eight-hour system. But you can't make men do their best unless you get them fully interested, proud of what they are doing, happier in mind, better in body and spirit, and producing something for themselves while they produce something for the business organization of which they are a part."

At the annual meeting of the Firestone Tire & Rubber Co., which was held November 2, several important business matters were acted upon. The call for the meeting, dated August 31, proposed an increase of the capital stock to \$50,000,000, and a stock dividend of 700 or 800 per cent. Instead of this the stockholders voted to fix the authorized capitalization at \$15,000,000, and to reduce the nominal value of shares from \$100 to \$10. It was also voted to enlarge the board of directors from five to seven members, and to sell \$500,000 worth of common stock to employes and officers.

Perhaps the action which received the greatest comment was the motion to set aside \$1,000,000 for an employes' welfare and insurance fund. This, coming almost immediately after the dedication and presentation to the employes of the handsome new clubhouse, built at a cost of \$300,000, adds another link to the great welfare chain that binds together employer and employes.

The election, at the annual meeting, of R. J. Firestone as vice-president came as the direct result of his splendid record as general sales manager for several years past. Under his direction sales have been increasing at the rate of 30 to 60 per cent annually until at the end of the fiscal year which closed August 1, Firestone business had exceeded \$33,000,000. Mr. Firestone is widely known in motor car circles throughout the country and as vice-president will find even more and broader opportunities to utilize his knowledge, long experience and forceful personality to good purpose.

R. J. FIRESTONE.

A. G. Partridge, formerly assistant sales manager, has succeeded Mr. Firestone as general sales manager. Long service well equips him for the larger work and his appointment is in accord with the Firestone policy of promoting men who have made good. F. C. Blanchard has also been promoted to sales manager in charge of the increasing business among motor car manufacturers.

The B. F. Goodrich Co. has adopted a plan designed to co-ordinate the various departments of the factory more closely and bring the executives in closer touch with the employes. An operating committee has been established by the directors of the company, which will advise with and aid the executive committee in all matters affecting the interests and management of the company. The members of the new committee are as follows: H. E. Joy, director of costs of goods and factory costs; W. O. Rutherford, director of sales; H. K. Raymond, director of production; A. B. Jones, director of plant administration; W. C. Geer, director of development of goods and processes; George Oenslager, director of chemical laboratories; W. A. Means, treasurer; A. P. Lohmann, engineer; H. C. Miller, manager of tire sales, and W. H. Yule, manager of sales of general rubber goods.

Arthur H. Marks, of The B. F. Goodrich Co., is the owner of the largest yacht in American waters and probably in the world, fitted with internal combustion engines. The "Aramis" is 157 feet in length over all, with 23 feet beam and a draft of 7 feet 6 inches. Her motive power consists of two 350 horse-power Craig-Diesel engines delivering her power at 300 revolutions per minute. Built entirely of steel, she also has two steel deck houses, one covering the dining saloon forward, and the after one built over the music hall and reception room. She is finished in mahogany and bright metal work and so makes one of the handsomest yachts afloat. Her tanks carry 6,000 gallons of crude oil fuel, which gives her a very long cruising radius. Besides the staterooms for the owner and his guests, there are quarters aboard for the crew of nine officers and men required to run her.

Within a short time Mr. Marks will take an extended Southern cruise in his new possession.

The Miller Rubber Co. is erecting a large eight-story building as an addition to its plant, and has also purchased 30 acres of ground in a suburb of Akron. The entire tire building plant will be located on this new property in the spring, the present factory being then devoted to druggists' sundries and other specialties.

The Amazon Tire & Rubber Co. manufactures a standard tire with an extra side-wall breaker strip, or blow-out protection, added. At present, the factory turns out about 45 tires a day. Recent large increase in business has made it necessary to add to the plant in order to expand the production, and when the new four-story building now being erected is completed, the output will average 300 tires daily.

The Goodyear Tire & Rubber Co. has purchased 10,000 acres of land in the Salt River valley, Phoenix, Arizona, where cotton raising will be undertaken on a large scale, thus insuring for the company's use a fixed supply of long staple Egyptian cotton.

James E. Taylor has been transferred from the Atlanta (Georgia) office of the Goodyear company to the home office, as special representative of the automobile tire department.

The Phoenix Rubber Co. has increased its capital stock from \$125,000 to \$500,000.

Two frame buildings are being erected for the Kelly-Springfield Tire Co. One will house the restaurant, now on the top floor of the main building, and the other the experimental department, this arrangement giving needed space for other purposes in the main building.

Sam S. Miller, factory manager of the Mohawk Rubber Co., recently celebrated the completion of his twentieth year of tire

building. Beginning with solid carriage tires and pneumatics for bicycles, he was among the first to provide the necessary tire equipment for automobiles, and from that day to this has taken a personal pride in maintaining the quality of his product. His particular interest has been the careful choice of raw materials.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent

THE month of November was a rather unsettled one in the rubber industry of Rhode Island, labor troubles having been experienced at two of the United States Rubber Co.'s plants—the National India Rubber Co., at Bristol, and the Alice rubber and shoe mill of the Woonsocket Rubber Co., at Woonsocket. In consequence of the strike at the National company's plant, work at the Narragansett Rubber Co. in that town was interrupted and the workmen threatened by the strikers if they did not go out.

While the situation at Bristol at one time appeared to be assuming a serious aspect, the firmness of the police and the severity of the court kept matters well in hand and resulted in an early understanding that led to an amicable settlement.

Throughout the state, rubber factories have an increasing number of orders ahead with a continued scarcity of help, although it is reported that applications for employment have recently been more numerous than at any time for several months. There appears to be no prospect of any immediate let-up in the demand for shoes, tires, medical goods and other lines made here.

* * *

The announcement on November 23 of a 10 per cent "emergency increase because of abnormal world conditions," affecting 7,500 to 10,000 employes of rubber factories in Rhode Island, did much to clarify the situation, and it is now thought that there will be no further labor troubles, at least during the continuance of the present scale and agreement.

The notices posted at the mills controlled by the United States Rubber Co. announced that the increase was in the nature of a cash bonus, but those posted in the factory of at least one company were for a straight raise of 10 per cent. In another mill the management states that it was the third raise to its employes within the calendar year and that a new record in the payment of wages had been established in the trade.

The mills affected by the United States Rubber Co.'s notice in Rhode Island and the number of employes in each are the Alice Mills at Woonsocket, 1,600; the Millville Mill at Millville, 800; the Lawrence Felting Co. at Millville, 250, and the National India Rubber Co. at Bristol, 4,000. In Providence the Revere Rubber Co. employs 700 to 800 operatives; the Mechanical Fabric Co., 250, and the Narragansett Rubber Co. at Bristol, 700.

* * *

The increased business experienced by the Narragansett Rubber Co., of Bristol, has been so great during the last few months that it has become necessary to provide additional factory room. A complete rearrangement of the plant with additional departments is under consideration, but meanwhile temporary arrangements are being made to take care of immediate demands. A new addition, 85 by 50 feet, has just been erected on the Richmond street side of the plant that will afford some relief for the present. Part of the lower floor will be utilized by the calendering department and the remainder will be occupied as a storehouse. The second floor will be absorbed by the steadily increasing shoe business.

The two-story frame manufacturing building on South Main and Wheaton streets, Warren, is being remodeled for occupancy for storage purposes by the National India Rubber Co., of Bristol, by whom it has been leased.

John E. Magee, for the past 17 years electrician at the factory of the National India Rubber Co., is now policing the entire plant at Bristol.

Robert W. S. Cox, for several years sales manager of the insulated wire department of the National India Rubber Co., has resigned and gone into business for himself with headquarters at Boston. George Cragin has been appointed general sales manager of the wire division, coming to Bristol from New York, where for a number of years he held a responsible position with the American Steel & Wire Co.

William McCaw, formerly paymaster in the office of the National India Rubber Co. at Bristol, but more recently assistant treasurer of the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, has recently been promoted to sales manager in the South, with an office at Atlanta, Georgia.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE "Best" fire hose of the Empire Rubber & Tire Co. won new laurels a few days ago when the city of Detroit, Michigan, placed an order for 8,000 feet of it. Detroit has been using Empire hose for some time and the best evidence of the satisfaction it has given is reflected in the order just placed. Never before has the mechanical goods department enjoyed such prosperity as at present. It is an old story about the tire department working both night and day to turn out 1,500 tires daily, and now this same gratifying condition of affairs has reached the mechanical goods department, now averaging \$800,000 annual business. The molded hose department is also rushed with orders.

The big increase of the business of the Empire company has necessitated reorganizing and refinancing by incorporating under the laws of the State of Virginia. The new company, to be known as the Empire Tire & Rubber Corporation, has a capital consisting of \$1,500,000, 7 per cent cumulative convertible preferred, par value \$100, and \$4,500,000 common, par value \$10. The preferred stock is offered for public subscription by Andrews & Co., New York City, and is convertible at the option of the holder into an equivalent par value of common between June 30, 1917, and July 1, 1920. The new affiliations are expected to insure a \$5,000,000 business annually, or about double the present output.

General C. Edward Murray, president of the Empire Rubber Co., Trenton, New Jersey, was among the speakers at the Chamber of Commerce dinner held recently at the City Club in Boston, Massachusetts.

* * *

The Home Rubber Co. is erecting an addition to its plant costing \$750,000.

* * *

The Adolph Biller Rubber & Leather Cement Co. has been formed here, with Adolph Biller as the active head. The company has a well equipped factory, and for the convenience of the trade a down-town office has been opened. A new cement for automobile tires and the shoe trade is to be featured this year.

* * *

The John A. Roebling's Sons Co. is among the concerns which have been allotted space in the electrical and industrial show to be held in Masonic Temple from the first to the fifth of this month.

* * *

John Hermann, Jr., superintendent of the Woven Steel Hose & Rubber Co., paid a novel election wager when he wheeled a Wilson man through the streets in a barrow. A drum corps accompanied the outfit and there were about two score people trailing behind burning red fire, beating on pans, etc.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE calling of men to the colors proceeds apace with more disastrous effects upon small businesses than upon large ones. Few firms have had to close down entirely for this cause, but one instance has come to my personal knowledge. This is the interesting crude rubber washing business that was carried on by the late Mr. Eyre at Holywell, North Wales. Since Mr. Eyre's death the business known as the Meadow Mills, Limited, has been carried on by his son, but the recent calling of many of the hands and of William Eyre himself to the colors has necessitated the temporary stoppage of the works, which are interesting from the fact of the motive power for the rubber washing machines being derived from a water-wheel. The company has an office at 4 South Bridgewater street, Liverpool. Possibly there are other cases of closing down in the rubber trade, but as a rule dilution of labor has enabled the management to keep going, even if on a smaller scale than customary.

AMERICAN CHEWING GUM IN ENGLAND.

There is no getting away from the war, and a minor point of some interest which has resulted from its incidence is the popularization of American chewing gum in Great Britain, where its use was formerly practically unknown. It is said that about 40 years ago the chewing of pure erasing rubber was not unknown in certain circles, a working day being required by the operator to reduce the material to a pulp. I understand that the present-day American product, as used by Canadian soldiers, is a much superior article to erasing rubber, so it is quite probable that the chewing habit will become popular here.

PETROL AND SUBSTITUTES.

The petrol restrictions, as was anticipated, have had a considerable effect on the tire industry; an effect which would have been more pronounced if they had come into force earlier in the summer. With regard to the use of substitutes, several of which have made their appearance on the market, some appeal cases are pending, arising out of conviction of charabanc owners in courts of summary jurisdiction.

CRUDE RUBBER.

There is nothing new in the raw rubber situation, except in the magnitude of the stock on hand, which some say is in part already the property of the enemy, to be utilized when the long deferred peace comes. A topic which has occasioned a good deal of wonder and talk is the enormous expansion of the American imports of rubber, which have risen from 57,253 tons in 1913-14 to 117,441 tons in 1915-16. Progress like this ought to reassure those pessimists who foretell a glut of rubber a few years hence.

VULCANIZATION WITHOUT SULPHUR.

Our contemporary, the "India Rubber Journal," has recently given an important translation of Ostromyslenski's papers in Russian on the subject of vulcanization. The researches detailed in these papers deal with (1) the hot vulcanization of rubber by nitro compounds without sulphur and (2) the hot vulcanization of rubber by means of peroxides or "per-acids" in absence of sulphur. I shall not reproduce any part of these papers here, as they were reprinted in THE INDIA RUBBER WORLD for November, but merely wish to call attention to what are undoubtedly discoveries in rubber chemistry and which may have a profound influence upon rubber technology. I say "may" rather than "will," because, as we all know, the best and in most cases the only reliable test of a novelty in rubber manufacturing procedure is that of longevity. In the past we have been taught to avoid the use of bodies such as peroxides in rubber and there will be many who will prefer to wait and see what the rubber looks like after a year or two before allowing themselves to wax enthusiastic over the new discoveries.

So far I have not found any enthusiasm on the subject among the purveyors of sulphur specially prepared for the rubber trade, but they console themselves with the fact that the much talked of use of amido compounds in vulcanization has not brought about any appreciable diminution in the volume of their business.

An interesting point for the future is how the rubber vulcanized without sulphur will behave under the various reclaiming processes. It is quite possible that superior reclaims will be obtained by some modification of the chemical reaction involved. Another point to be considered is that sulphur is frequently used as a filler to add bulk to the rubber in addition to effecting vulcanization. In this case it does not usually rank as mineral. In order, then, to keep the specific gravity the same, a substitution of some other mineral matter for the sulphur would have to take place, as the new vulcanizers are used in such small quantity.

ESTIMATING THE SULPHUR IN RUBBER.

Another paper by J. B. Tuttle and A. Isaacs on the estimation of total sulphur in rubber, and emanating from the Bureau of Standards, Washington, U. S. A., is full of interest and seems to emphasize the opinion I came to years ago, that it is difficult to lay down any method that is equally accurate with all rubber goods, from toy balloons to perambulator tires. A method that may give excellent results with rubber of one composition may prove faulty in the case of quite another composition. A point that must not be lost sight of is that time is often of greater importance than extreme accuracy. In a great many industries analytical methods of quite sufficient accuracy are in daily use, because results are wanted and it is impossible to wait a week for them. Many methods which are properly indispensable in the research laboratory where time is of no object are frequently put before the worthy chemist, who finds it impossible to employ them. Of course, if the new vulcanization without sulphur comes to anything, the correct estimation of this element loses its present importance.

SCOTTISH BUSINESS NOTES.

The North British Rubber Co., Limited, Edinburgh, has issued an attractive illustrated booklet comprising a price list for sand shoes and tennis shoes for 1917. With regard to these it is a condition of sale that in the event of a notification of an advance in price during 1917 no sales shall be made by customers below such advanced prices, even though the goods may have been delivered by them prior to the date of such advance. A novelty in the list is the khaki-colored canvas shoe which it is stated is much in demand in military circles, presumably such circles as are still in training at home.

The special grooved soling, which was brought out by the company, is intended to get over the trouble of breakage at the base of the groove. The grooves do not run directly across the sole, but are at a slight angle, which quite overcomes the difficulty previously experienced. The Clyde Rubber Works, Limited, which a few years ago removed from Glasgow to more commodious premises at Renfrew, a few miles away, reports very good business in mechanical rubbers, especially for railway requirements, in which the company specializes. Mr. Sharp and his son are the moving spirits in the management of the works.

RUBBER SPONGES.

Like food and all sorts of other commodities, the natural sponge has risen in price owing to the war. This has led to an increased demand for the rubber sponge, a demand which is being satisfied to a large extent by importations from America. As one now rarely sees in the shop windows the mystic Russian characters adorning labels on sponges, it looks as if the well-

known, high class rubber sponges of the Russian-American India Rubber Co., of Petrograd, had ceased coming, or at any rate only in reduced quantities. American sponges are being sold at the low price of sixpence at the F. W. Woolworth & Co., Limited, new stores in Manchester. Rubber household gloves can also be bought at these stores for sixpence each, one glove if you do not want a pair.

DUNLOP RUBBER CO.

This extremely successful rubber manufacturing firm has again increased its capital, this time to three million pounds by the creation of one million cumulative 6½ per cent preferred shares of £1 each. The proceeds of this issue are intended to finance the carrying of larger stocks, and also to provide working capital for a new department for the manufacture of solid motor tires for transport purposes. Sir Arthur Du Cros, Baronet, who presided at the meeting, made some rather trenchant remarks about foreign competition. The new association of British Tyre Manufacturers, of which he was president, have it as their main object, he said, to protect the interests of British manufacturers, there being no question of amalgamation to control prices.

SOME FOREIGN RUBBER NOTES.

SWISS MARKET FOR EBONITE.

THE American Consul at Berne, Switzerland, reports that, despite a considerable home production, about \$25,000 worth of foreign ebonite of the better qualities was purchased yearly by Switzerland before the war, principally from Germany, Italy, and France. Present importations, however, amount to only one-fourth of that figure. No more rubber or kindred articles can be obtained from Germany, but Swiss buyers have been able to obtain small quantities from France and England. Efforts are also being made to obtain goods in the United States, but importers are experiencing difficulty in getting deliveries.

One large Berne concern, which makes practically all of the telephonic and telegraphic apparatus used in Switzerland, and is said to be one of the largest consumers of ebonite in the country, bought up all the ebonite that could be found in the republic. It was thus able to continue business in the ordinary way, but its small stocks are decreasing rapidly. An order placed in America six months ago by this firm is still unfilled. The company uses ebonite in sheets, thickness 0.5 millimeter to 30 millimeters [0.019685 to 1.1811 inches], in round rods from 2 to 30 millimeters [0.07874 to 1.1811 inches], in tubes from 2½ to 3½ centimeters [0.98425 to 1.37795 inches], and various other forms and sizes.

It appears that Swiss consumers are buying direct from the manufacturers, either domestic or foreign. There are no local agents or dealers in the trade. Before the war ebonite goods were sold by the Swiss manufacturers on terms of 30 days with 2 per cent., or 3 months net. On imported wares the terms formerly were 30 days net after arrival of goods; since the war, cash against documents. The duty on ebonite in bands, sheets, various forms of manufactured articles, cords, bullets, rods, etc., is \$0.0875 per 100 pounds.

The following are the principal consumers of ebonite:

Hasler Aktiengesellschaft Telephon & Telegraphenwerkstatte, Schwartzthorstrasse, Berne; Schaefer Aktiengesellschaft, Sanitätsgeschäft, Berne; E. F. Buchi, Optische Werkstatte, Berne; Stoppani Aktiengesellschaft, Präzisionswerkstatte, 25 Neuen Königsstrasse, Berne; Société des Condensateurs Électriques, Fribourg; Société de la Fabrique d'Appareils Électriques, Neufchâtel. Haaf & Co., Liefeld bei Berne.

G. Keller, Kautschukwaren, Biel (Berne), is a wholesale dealer in rubber goods.

FRANCE RELEASES CARBON TETRACHLORIDE.

An order of the French Government, dated November 11, 1916, abrogates the prohibition of exportation of carbon tetrachloride.

This chemical was included among articles placed under embargo by a decree of October 26, 1916.

IMPORTS OF RUBBER GOODS.

The Department of Import Restrictions announces that it has been decided that where goods falling under a prohibited description are made wholly or mainly of rubber, importation into the United Kingdom is permitted under general license.

SWEDEN AND PARCEL MAILS TO RUSSIA.

We learn here that Sweden has released parcels mails between this country and Russia which were under embargo in transit through Sweden early this year. Among these parcels were 54 packages of rubber goods, chiefly rubber heels.

THE RUBBER TRADE IN GERMANY.

DESPITE the demands of the present, industrial Germany is not losing sight of the future; it is realized that international trade competition will be very keen after peace is declared. Our manufacturers foresee that they will be called upon to increase the productivity of their factories tremendously, and are already organizing for industrial preparedness.

MANUFACTURERS' TRUST.

To unify and combine our efforts in the commercial struggle after the war, an important step was taken recently. The Industrial Council which has been formed, virtually unites our entire manufacturing industry. It provides a "connecting-link" between the Central Association of German Industrials, the League of German Industries and the Society of German Chemical Industries. These organizations, which have been collaborating since the outbreak of the war, now form an alliance on a permanent basis in order to coöperate in meeting new conditions after the war and to recover our lost world trade.

Rubber manufacturers are well represented in this consolidation; so also are our cable manufacturers through their syndicate.

RAW MATERIALS.

Our greatest inconvenience continues to be the shortage of raw materials. We are doing our best with this problem at the present time and not losing sight of its vital importance in preparing for the "after war." We realize that our wonderful substitute materials, however convenient they now are, will not all be of great use in peace times.

SYNTHETIC RUBBER.

The production of synthetic rubber was, of course, achieved long before the war. Bayer & Co., of Elberfeld, produced it several years ago, but it was too costly to be of real commercial value under normal conditions. Since the outbreak of the war, crude rubber has become so scarce and so costly that the synthetic product has found a ready market. Bayer & Co. continue to manufacture artificial rubber and have been joined in this line by the Franz Clouth Rheinische Gummiwarenfabrik, Cologne-Nippes. Synthetic rubber is now used in compounds for both hard and soft rubber goods. For the latter, however, it is usually employed in connection with either crude or reclaimed rubber. Of the durability of goods produced from artificial rubber, little is known, but their cost is very high; so high that they will not be able to compete with goods made with crude rubber at normal prices.

RECLAIMED RUBBER.

Reclaimed rubber continues to be much in demand and to bring really exceptional prices, especially when one considers the fact that only goods of inferior quality can be produced from it alone, without any addition of the crude product.

RATTAN TIRES.

Reclaimed rubber does fairly well for tire casings, but is practically useless for making inner tubes. Its price, as already stated, is very high for the service it gives, and this has led to many attempts to create substitutes for rubber tires.

Bicycles equipped with tires made of woven rattan were seen recently on the streets of Berlin. They are said to provide resiliency equal to that of solid rubber tires, but not so great as that of pneumatics. The sad thing about rattan tires is that rattan is not a domestic product; it is scarce and costly, although it may be possible to obtain adequate supplies of it through Turkey.

LIQUID GLOVES.

Our newspapers have been giving much space to what they term "liquid gloves" that are worn by army surgeons and their aids when performing operations or dressing open wounds. Before the surgeon begins an operation he sterilizes his hands, as usual, and then rubs over them an antiseptic solution of cellulose, which dries rapidly, forming a thin artificial skin which is entirely flexible though not so pliable as very fine rubber, which it much resembles. After the operation the cellulose can be removed quickly with warm water and certain chemicals.

From what can be learned about these "liquid gloves" they are not altogether satisfactory and are used only for short operations when suitable rubber gloves are not available. They are not sufficiently durable to enable one to undertake long operations with them, and when left any length of time on the hands they cause them to become numb and swollen. Though the daily papers have spoken of "liquid gloves" being in general use among army surgeons, this is hardly correct. It would be nearer the truth to say that these gloves are used mostly by nurses and assistants who formerly used no gloves at all.

RUBBER COMPANIES AND WAR LOANS.

Our rubber manufacturers continue to be large subscribers to war loans. The Continental Caoutchouc & Gutta Percha Co., of Hanover, subscribed 5,500,000 marks [\$1,369,000] to the last war loan. Other companies subscribed in proportion to their wealth and importance.

THE SITUATION IN RUSSIA.

By A Special Correspondent.

THERE is a strong analogy between the economic and industrial problems of Russia today and those of the United States at the time of your Civil War. Fifty-two years ago your country was struggling for national existence, you had a colossal

SOCIÉTÉ KAUSCHUK WORKS, RIGA.

war debt, your currency was much depreciated. Yet you were on the morn of your most remarkable period of industrial and commercial development.

In the present war Russia is struggling for national life and is undoubtedly at the same time opening a new era of industrial development and material prosperity. Russia, unlike most of

the other countries engaged in this great war, has behind her huge undeveloped resources, just as the United States had half a century ago, and the drain of the present struggle stimulates us in developing these resources.

You Americans seem to know remarkably little about Russia. Of first-hand information you have very little, and you are too much inclined to imagine Russia as she was prior to the Russo-Japanese war. You forget to note the fact that between 1901 and 1914 Russia's industries had increased enormously; that her trade had doubled and that, as a consequence of both, the money in Russian banks and in circulation multiplied from \$918,000,000* to \$1,938,000,000*, an increase of about 111 per cent. During the ten years between the Russo-Japanese war and the present war, Russia's wealth was actually doubled. Bearing this absolute, fundamental fact in mind, you will be able to imagine the momentous occurrences in Russian economic life in connection with the present war.

EFFECT OF WAR ON INDUSTRIES.

Since the outbreak of the war most of our industries have been mobilized and are working for military purposes only. This mobilization has meant much to all our industries and especially to the middle-class and small industrial undertakings which have been obliged to adopt efficiency methods they never before dreamed of. It is impossible to state the quantities of goods of all kinds that have been produced here for the army, but I may mention an instance where one organization alone, from the beginning of the war up to August, 1915, produced three million pairs of army boots and more than a million pairs of snowshoes: a production all out of proportion to anything it had done before the war.

Our unprecedented industrial activity of the past two years has made domestic trade well above normal in spite of the fact that millions of men have been taken away from their homes. The buying power of our population has increased remarkably both in the cities and the rural districts.

RUBBER FOOTWEAR.

The increased prosperity of the masses and the impossibility of spending money for intoxicants, which are prohibited, have led to its expenditure for wearing apparel. Every good Russian who can afford to do so wears rubber shoes of some kind or another. Our great rubber companies owe most of their prosperity to the manufacture of footwear which, prior to the war, they supplied to millions both here and abroad.

When the war came our rubber companies had large stocks of footwear on hand and very little got out of the country before the export embargo went into effect. Although there was a temporary stoppage in the manufacture of these goods, their production is now near normal and nothing is going abroad. Russia today is probably consuming 150,000 pairs of rubber shoes each day.

RUBBER FACTORIES.

Germans, who formerly controlled and operated most of our rubber factories, have been entirely eliminated and this great industry is centering in Moscow, the old Russian capital.

The Russian-American India Rubber Co., "Treugolnik," still retains its factories in Petrograd, and the rubber reclaiming plant in Odessa, owned by an American concern, is, as far as I can learn, still in operation there, but the Russian-French India Rubber, Gutta Percha and Telegraph Works, "Prowodnik," have definitely removed their entire equipment from Riga and are now in full operation in their new Moscow establishment where they are employing more than 25,000 people, mostly Russians, who have been trained to take the place of the "Baltic labor" that was formerly employed in Riga. The Imperial Government contributed 12,000,000 rubles [\$6,180,000] towards the cost of the new plant.

The plant which the French Etablissements Bergougnan had

* These figures are based on millions of rubles.

installed in Riga a year prior to the war, and which is known as the Société Kautschuk, has also been removed to Moscow where it is now in full operation producing tires for our armies.

RAW MATERIALS.

Our rubber factories have at no time had to suffer from any shortage of crude rubber; they had immense stocks on hand when the war broke out and have continued to receive shipments in proportion to their requirements. Chemicals and compounding ingredients have at times been very scarce, but not enough so to prevent our rubber manufacturers from maintaining their enormous production.

RUBBER WASTE.

Progress has been made in the rubber reclaiming industry here since the outbreak of the war, but the quantities of rubber scrap—mostly footwear—that are accumulating are tremendous, and prices are very low. This old rubber is being collected gradually, sorted and stored for keeping until normal conditions will permit its exportation.

Prior to the war we exported rubber waste in very large quantities to England, the United States and Germany. The last three normal years previous to the war these exports to the United States alone averaged 6,235,916 pounds in weight and \$492,425 in value per annum.

It is rumored that the Russian Asiatic Bank, probably the principal owner of our large trans-Atlantic and trans-Pacific steamship companies, is helping to finance the collection, sorting and storing of rubber waste which will be exported after the war.

NEW RUBBER CEMENT.

Unlike the soldiers of the other warring nations, most of whom travel by train or motor, the millions of our troops have to march, and the problem of keeping their feet from direct contact with the ground is no small one, especially in view of the fact that machinery for re-soling boots is rare in Russia and hand-work requires much time.

This condition of affairs led to the idea of cementing rubber patches and half-soles to worn-out soldier's boots, but this, too, was a long operation until a rubber expert discovered a cement which is not affected by variations of temperature, can be used cold, and dries so quickly that a good workman can repair from 200 to 230 boots a day.

This discovery was made in 1915 when, as a first experiment, a company of infantry of 200 men was shod with rubber soles applied to their boots with this new cement. The results were so gratifying that now there are many Russian regiments marching on rubber soles and I understand "rubber-cobblers" trained to use the new cement, will be attached to each and every company of the army.

THE RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

ACCORDING to the latest reports from the Agriculture and Commerce Department of the Japanese Government, crude rubber imports in 1915 amounted to 3,903,550 pounds valued at \$1,715,793, an increase of 1,598,288 pounds and \$708,479 over the preceding year. The imports at Kobe alone reached 2,350,376 pounds valued at \$1,608,594.

CRUDE RUBBER IMPORTS.

	1914.		1915.	
	Pounds.	Value.	Pounds.	Value.

	2,305,262	\$1,073,319	3,903,550	\$1,715,793

TIRE INDUSTRY GROWING RAPIDLY.

The increase was due to the demands of the newly established works in Tokio and Osaka and much enlarged consumption of the Dunlop Rubber Co. (Far East), Limited, the Kakuichi Rubber Co., and other leading firms. The Japanese rubber industry has been making great progress. Goods of every description are being manufactured at rather lower prices than hitherto, not only for home consumption—supplied by imports before the war—but to meet foreign demands as well. For instance, bicycle tires are now being made at 1.80 yen (90 cents) a pair, former prices being 5-6 yen (\$2.50 to \$3.00) a pair. Tire manufacturers in Tokio and Osaka have manufactured sixty to seventy thousand pairs for foreign orders and many more for jinrikishas, which were formerly imported from Germany. The Dunlop Rubber Co. (Far East), Limited, manufactured ten times the ordinary annual output of bicycle and automobile tires to fill the British orders.

CRUDE RUBBER FROM CEYLON, JAVA AND ENGLAND.

Imports of crude rubber from Ceylon increased greatly during the Singapore embargo from October, 1914, to April, 1915, but fell off again after the latter date because of the lower Singapore prices and the shorter distance to Japan. Singapore imports included plantation pale sheet, smoked sheet, mixed sheet and pale crepe in about equal quantities. Native rubber from India and Borneo, previously much used by Japan, were not in demand because of the supply of plantation rubber.

Crude rubber from Java, never imported before, began to come in after the Singapore embargo was declared, and still continues to be imported because the prices are lower. Both smoked sheet and crepe are received. Japanese rubber manufacturers could scarcely have maintained their output except for Japanese imports.

Crude rubber from England could be imported during the embargo, but at first little use was made of this fact because of the time required and the fear that the embargo might be removed before receipt of the British goods. During the autumn, however, large British shipments were received for the manufacture of bicycle and automobile tires for export. Crude rubber was also wanted from the United States, but American prices were higher than British and shipping facilities were not so good as from England.

The crude rubber quotations in Osaka, 1915, were as follows:

	January-April.		July-August.		November.	
	United States Cur.	Yen.	United States Cur.	Yen.	United States Cur.	Yen.
Borneo rubber...per 100 pounds ..	346,120	63.75	311,88	75	337.50	
India rubber	85	\$42.50	85.00	42.50	100	50.00
Pale sheet	105	52.50	115.00	57.50	150	75.00
South American Para.....	150	75.00	140.00	70.00	160	80.00

RUBBER TIRE EXPORTS.

In 1915, tire exports amounted to 2,512,966 pounds valued at \$1,706,316, an increase of 1,630,191 pounds and \$1,163,181 over the previous year. Detailed figures follow:

	1914.		1915.	
	Pounds.	Value.	Pounds.	Value.
China	346,120	\$203,192	625,837	\$376,311
Kwanton Province	4,556	2,716	7,916	3,489
Hongkong	2,938	1,366	61,365	39,699
British India	37,756	30,720	367,318	241,452
Straits Settlements	224,470	142,086	1,008,330	730,476
Dutch India	250,224	158,327	92,545	57,537
French India	750	527	92,545	57,537
Great Britain	5,758	3,805	348,654	256,774
Siam	140	78	452	152
Germany	10	11
United States	10,000	241
Canada	53	66
Australia	332	278
Total	882,775	\$543,135	2,512,966	\$1,706,316

Aside from supplying home demands the Japanese rubber industry has made great progress in the export of rubber tires and other goods to Straits Settlements and Asiatic countries supplied by European countries previous to the war. Large or-

ders have recently been shipped to Europe for military purposes. Even the Chinese, who had boycotted Japanese goods, were obliged to buy them in great quantity. Jinrikisha tires were exported to tropical lands where bicycles are almost unknown and some of them were probably re-exported to Europe for other uses by the Allied armies. Of the total tire exports, 60 per cent was jinrikisha tires and the other 40 per cent bicycle and automobile tires in nearly equal quantities. The firms engaged in this business are the Dunlop Rubber Co. (Far East), Limited, the Toyo Rubber Co., Limited, the Mitatsuchi Rubber Manufacturing Co., the Kakuichi Rubber Co., the Nihon Rubber Co., Limited, and other works. Automobile and bicycle tires for export were made principally at the Dunlop works.

Jinrikisha pneumatic tires for export are 900 by 50 millimeters, not the 43-inch size common in Japan. Automobile tires for export are mostly pneumatics 34 by 3 and 28 by 3, although some consumers order by metric measure. Bicycle tires for export are 28 by 1½ and 26 by 1½, not 1¾ as in Japan. Wired-on tires are made only by the Dunlop Rubber Co. (Far East), Limited.

Despite the high prices of crude rubber and compounding ingredients since the war, the export prices have remained relatively low, as follows:

Jinrikisha tires (including tube), per pair, 20 yen (\$10.00).

Automobile pneumatic tires, each, 35-80 yen (\$17.50 to \$40.00).

Bicycle tires, per pair, 5-13 yen (\$2.50 to \$6.50).

Tubes for bicycle tires, per pair, 1.30-2.00 yen (\$0.65 to \$1.00).

THE RUBBER TRADE IN MALAYA.

By Our Regular Correspondent.

THOUGH war has had little or no effect on the rubber plantation industry of Malaya, there are a good many who say that because of the war it is necessary to make preparations for the future. It is in the coming trade war, which the Allies are steadily bent upon, that the need of combination and organization in the industry will be felt. The chairman of a prominent rubber company recently referred to the entire lack of these important qualities while emphasizing that the need for them was never so apparent as to-day.

The purchasing of rubber, he pointed out, is getting more and more into the hands of powerful and aggressive groups who are adept in the art of depressing the market for a month or two before they make their heaviest purchases. For the trade war which is to follow upon the declaration of peace, practically every great industry is already taking steps to organize its plan of campaign, with the one great exception of the rubber plantation industry. The Germans, on their side, are not idle. They have already formed central societies which will buy for each large industry, and as regards rubber the German Empire is going to need an immense tonnage of the commodity when the war is over. Many manufacturers of rubber goods contend that for every pound of new rubber used in manufacturing rubber goods two pounds of recovered rubber are also employed. That stock of recovered rubber has run out in Germany, and the requirements of the country will be very great indeed when there is an opportunity to supply them.

It is suggested that a very simple means of helping to strengthen the rubber plantation industry is to popularize and extend advance contract sales, and thus reduce as far as possible the amounts of unsold rubber arriving on the market at any one time. As previously pointed out, when at the end of last year a number of companies found that with the rise in the price of rubber the advance contracts they had necessitated selling at less than the current market price, many thought that the advance contract policy was not a good one to continue. The idea that this method circumvents the schemes of powerful groups who can depress the market a month or two before buying is a new one, and it is certainly seems worthy of some consideration.

The Planters' Association of Malaya, the organization of the planting community, touched upon a large question at one of its recent meetings, when the secretary reported the result of his interview with the Chief Secretary to the Government on the subject of the alienation of planting land. Particulars of applications for such areas, said to have been made on behalf of various American companies, were given, and it was rightly observed that the question was a broad imperial one, upon which the association was hardly called upon to express an opinion. In so far as it went, however, the secretary's statement disclosed an attitude of distinct hostility to such alienation of land in existing circumstances, and there is probably a widespread, though unexpressed, feeling to the same effect in many other parts of the country. The government has given an assurance that no such alienations have taken place, and with that the planters may rest satisfied. No doubt the matter will be allowed to lapse until it is known how definite action one way or the other will coincide with the Imperial interests of the nation.

The industry in Malaya, by the way, has good reason to be grateful to the Federated Malay States Department of Agriculture, which is continually conducting investigations with reference to the improved production and subsequent treatment of rubber. Lectures on the subject are constantly given to planters in various states, and at a recent one, B. J. Eaton, agricultural chemist, detailed some highly interesting experiments with regard to the variability of plantation rubber. After describing the vulcanizing process, discovered independently by Goodyear in America and Hancock in England, Mr. Eaton gave a review of the results attained by the Federated Malay States Agricultural Department. These showed that the principal variability of plantation rubber was in respect to the rate of vulcanization in the case of first-grade rubber, and that differences in strength after vulcanization were of a much smaller degree.

As regards the uniformity of fine hard Para, Mr. Eaton suggested that this was due to the fact that a ball of hard Para took about two months to prepare, and thus a daily variation in the latex or the treatment to which it was subjected was averaged. One method of insuring uniformity in estate practice could be effected by mixing a sheet from each day's latex in each box over a period of a month or more.

The method of preparing rubber by keeping it in the form of coagulant for six days before machining proves to be very valuable from the viewpoint of rapid vulcanization and of quality. It is interesting to know that one of the leading American manufacturers recently asked for a consignment of about half a ton of this type of rubber for testing purposes.

NEW RUBBER EXPORTING CONCERN IN BRAZIL.

Stowell & Cia. is the name of a new concern with headquarters at Para and a branch office at Manaus, State of Amazonas, which will devote itself exclusively to the purchase and exportation of rubber, as agents for Heilbut, Symons & Co. of London and Liverpool, and Arnold & Zeiss of New York City. The members of the firm are T. B. Stowell, Albert Suter and Henri Voegeli, Mr. Suter having charge of the principal office at Para, and Mr. Voegeli being manager of the Manaus office. This new concern has no connection with the firm bearing a similar name in Liverpool. Messrs. Stowell Bros., Para, and Stowell & Sons, Manaus, which are branches of Stowell & Co., Liverpool, England, state that they continue their business as heretofore and that there is no change nor alteration in their firm names or business.

RUBBER EXPORTS FROM THE IVORY COAST.

Exports of crude rubber from the Ivory Coast during the first six months of 1916 amounted to 503,358 pounds, against 145,871 pounds exported during the corresponding period of 1915, showing an increase of 357,487 pounds.

Rubber Planting Notes.

A NEW RUBBER COAGULANT.

"COAGULATEN" is the name of a new chemical now widely advertised in Far Eastern papers and recommended as superior to and more economical than acetic acid as a rubber coagulant. The Chemical Laboratory of the Agricultural Department of the Federated Malay States acquired a sample of Coagulatex for investigation and has published a preliminary note on the subject.

It consists of a heavy yellow-colored liquid, strongly acid, and, on analysis, found to contain sulphuric and hydrochloric acids, the latter being present in small proportion only together with a small percentage of some mineral constituent of salt.

The value of this as a coagulant depends almost entirely on the sulphuric acid, since other constituents would have little or no effect. B. J. Eaton, author of the preliminary note in question, remarks:

It is stated in the advertisement that "Coagulatex" contains no vegetable matter; the utility of this statement is somewhat doubtful, as the absence of vegetable matter is by no means an advantage. Many vegetable acids, *e. g.*, citric, tartaric acids, etc., are good coagulants, their chief drawback being cost. Acetic acid is an organic acid, *i. e.*, of vegetable origin, which is a decided advantage, since an excess of such an acid is not likely to have such deleterious effect on a substance like rubber as mineral acids like sulphuric and hydrochloric would have.

ENEMIES OF NEW PLANTATION RUBBER.

From Kalutara, Ceylon, comes the information that the white ant or termite, and a snail known as the "Kalutara snail" have been added to "bark-rot" as other enemies of plantation rubber in Ceylon.

Both the termite and the "Kalutara snail" attack the bark of the "tapping area" of rubber trees. They devour the bark to a considerable depth, but do not attack the cambium. The bark is left by them full of rough shallow cavities which spoil the tapping area. The ants cover these holes with their mud nests and build little "communication trench-like" channels leading down to their burrows in the ground. As thousands of insects contribute to the work these nests become very large, and it appears that tar applied to the attacked areas, after the destruction of the nests, is not sufficient to discourage the termites.

The most efficient method of checking the destructive work of these white ants has been to destroy their earthwork completely by pouring kerosene oil over it and setting it on fire.

The snails lay thousands of yellowish eggs, about the size of a pepper seed, which they conceal carefully at the foot of the trees on which they live. These eggs are frequently found 3 or 4 inches below the surface of the ground, in bunches of 10 to 15.

If not destroyed, these eggs hatch in a few days and tiny snails soon cover the trunk of the tree. At this stage it is an easy matter to destroy the newcomers, but once they scatter, it is almost impossible to exterminate all of them until they are large and have done considerable damage to the bark of the *Hevea* trees attacked. However, Ceylon planters are said to be successfully combating both ants and snails, which they do not consider as a very serious menace to their rubber plantations.

MEDAN RUBBER SALES.

The first sale of crude rubber under the auspices of the Medan Society for Products Trade was held in that city in September, when more than 12,000 pounds of rubber crêpe were sold at auction. These sales will continue and are to be arranged to coincide with the Java-New York steamship sailings.

RUBBER IN BRITISH NORTH BORNEO.

Rubber production in British North Borneo is increasing. The trees on estates planted five and six years ago are now ready for tapping and in various quarters large areas are being placed under cultivation.

Statistics for the year 1915, just published, show that exports of plantation rubber totaled \$1,304,863, while exports of the wild sort amounted to only \$1,908, compared with 1914, when the figures were \$897,478 and \$8,484 for plantation and wild rubber exports, respectively.

This gain of over \$400,000 in the value of rubber exported is not only evidence of the progress of the industry, but of the prosperous condition of rubber estates generally. The exports of crude rubber from North Borneo to the United States, in which the plantation sort was alone represented, amounted to \$10,489 in 1915, against \$11,503 the previous year, showing a decrease of \$1,014. This decline is not peculiar to the rubber industry, for statistics show a falling off in all exports to the United States direct, a tendency probably due to the shortage in shipping facilities.

The total exports of crude gutta percha amounted to \$5,484 and \$3,347 in 1915 and 1914, respectively.

RUBBER IN UGANDA.

The Department of Agriculture of British Uganda reports that *Hevea* rubber trees planted in 1906 are giving fair results considering the high altitude (4,500 feet) of the Kakumiro plantation where they are growing and the fact that early neglect has allowed a species of couch-grass (*Lumbugu*) to establish itself among the roots. Seed collected from the trees has been sown in nurseries and has also been distributed to various parts of the protectorate.

Manihot, planted in July, 1912, at the Kakumiro plantation, has made good growth and many of the trees were ready for tapping in 1915. Some trees planted in June, 1912, were tapped heavily during December, 1914, and January, 1915, as they were of irregular growth and it was intended to remove them. The number of trees tapped was 65, with an average girth of 19 inches at a height of three feet from the ground. They were tapped 24 times, and yielded 110 ounces of dry rubber. The flow of latex was then but small and the trees therefore were rested with a view of tapping again at a later date. (Further details on the rubber industry in Uganda were given on page 148 of the December 1915 issue of THE INDIA RUBBER WORLD.)

RUBBER AND BALATA IN BRITISH GUIANA.

The Department of Lands and Mines of British Guiana has just issued a report on mining and agriculture in the colony, covering the period from April 1 to December 31, 1915, a change having been made in the financial year to coincide with the calendar year. The financial year heretofore ended March 31.

The quantity of balata exported during the nine months was 1,188,807 pounds, which was 41,394 pounds in excess of the total production for the preceding 12 months.

Rubber exports during the nine months amounted to 3,778 pounds, against 1,932 pounds during the financial year 1914-1915. All was collected from *Hevea Brasiliensis* trees on private properties. The estimated area under rubber at the end of the year was 4,687 acres.

While at present the output of rubber from these plantations is of little importance, the production in the future will show a rapid advance as the trees now planted come into bearing, the climate and the soil being very favorable to *Hevea* trees.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED OCTOBER 17, 1916.

- N**O. 1,201,252. Sectional pneumatic tire. R. E. Campbell, Columbia, S. C.
- 1,201,256. Bath-tub mat. W. H. Clarke, Los Angeles, Calif.
- 1,201,257. Tire fabric with wire warp threads. H. Z. Cobb, Winchester, Mass., assignor to Revere Rubber Co., Providence, R. I.
- 1,201,282. Tire casing. G. F. Fisher, Plainfield, N. J., assignor to Morgan & Wright, Detroit, Mich.
- 1,201,307. One-piece waterproof diaper. J. M. Joseph, assignor to S. H. Shoninger—both of Chicago, Ill.
- 1,201,340. Pneumatic tire. W. M. Peabody, Chicago, Ill.
- 1,201,495. Cushion-tire. H. Paine, O. A. Widerberg and P. R. Johnson, Worcester, Mass.
- 1,201,551. Rim for vehicle wheels. R. S. Bryant, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
- 1,201,556. Life saving suit having a collapsible air chamber adapted to inflation. J. Chlumsky, Chicago, Ill.
- 1,201,744. Multiple-serpentine-tread tire. F. W. Kremer, Carlstadt, N. J.
- 1,201,747. Collapsible rim for automobile tires. H. L. Lenherr and W. A. Lenherr, Mercersburg, Pa.
- 1,201,767. Massage apparatus comprising a cup-shaped soft rubber member. L. Schimek and P. Becker, Chicago, Ill.
- 1,201,808. Tear cup for milking machines. L. Pinesen, assignor to Perfection Manufacturing Co.—both of Minneapolis, Minn.
- 1,201,854. Locking mechanism for vehicle wheel rims. H. Mote, Detroit, Mich.
- 1,201,859. Tire comprising a casing, a metal band, and a hard rubber inclosure in which the band is embedded and secured by vulcanization. M. J. Napier, Detroit, Mich.
- 1,201,951. A feed bar for fountain pens. W. I. Ferris, Westfield, N. J., assignor to L. E. Waterman Co., New York City.
- 1,202,000. Tire shoe. W. W. McMahan, Detroit, Mich., and R. B. Price, New York City, assignors to Morgan & Wright, Detroit, Mich.

ISSUED OCTOBER 24, 1916.

- 1,202,188. Locking device for demountable automobile wheel rims and the like. F. D. Miller, Jr., Webster Groves, assignor to Hub-Ko Rim Lock Co., St. Louis—both in Missouri.
- 1,202,197. Life preserver. J. W. Lippincott, assignor of one-half to C. A. Lippincott—both of Little Rock, Ark.
- 1,202,200. Armor for pneumatic tires. A. L. McNaghten, Aberdeen, S. D.

- 1,202,383. Golf club head. H. V. Hardman, assignor to The Harbight Co.—both of Belleville, N. J.
- 1,202,390. Protector for pneumatic tires. F. H. Ihlenburg, New York City.
- 1,202,441. Protective automobile mat. C. W. Small, Malden, Mass.
- 1,202,490. Golf ball. C. Davis, U. S. Navy, and F. Kniffen, Wilmington, Del.; said Kniffen assignor to said Davis.
- 1,202,604. Double tube pneumatic tire. M. S. Stevenson, London, England.
- 1,202,668. Abdominal supporter comprising an elastic panel. M. E. Byrd, Mount Winans, Md.
- 1,202,695. Inner tube with ends flattened and connected by snap fasteners. F. Fenton, assignor to The Miller Rubber Co.—both of Akron, Ohio.
- 1,202,717. Necktie having a lining of sheet rubber. W. Hey, York, assignor to H. Goldstein & Co., Limited, London—both in England.
- 1,202,725. Tire protector. I. Karpen, Chicago, Ill.
- 1,202,726. Tire protector. I. Karpen, Chicago, Ill.
- 1,202,732. Cushion heel. T. B. Keogh, New York City, assignor of one-fourth to F. P. Auwoll, Brooklyn, N. Y., and one-fourth to N. P. Wedin, Jersey City, N. J.
- 1,202,738. Life preserving apparel. J. Klucina, Cicero, Ill.
- 1,202,740. A nursing bottle and nipple having a marginal joint fitting on the top. H. P. Kraft, Ridgewood, N. J.

ISSUED OCTOBER 31, 1916.

- 1,202,820. Rubber heel. E. J. Emery, Portsmouth, N. H.
- 1,202,827. Ventilated boot or shoe. A. Gerhold, London, England.
- 1,202,845. Wheel rim. F. F. Hultgreen, South Berkeley, Calif.
- 1,202,855. Tire bead. F. W. Kremer, Carlstadt, N. J.
- 1,202,877. Anesthesia apparatus. B. Morgan, Chicago, assignor to W. F. Clark, Oak Park—both in Illinois.
- 1,202,898. Tire casing with internal springs. A. C. Salter, Bartow, Ga.
- 1,202,919. Pneumatic tire. J. D. Tew, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.

- 1,202,968. Pneumatic tire shoe. I. W. Cole, Plainfield, N. J.
- 1,202,991. Pneumatic tire. J. Girard, Montreal, Quebec, Canada.
- 1,202,993. Hose coupling. E. H. Gold, Chicago, Ill.
- 1,203,020. Corset with elastic garter. J. Leppell and M. Heberfeld, New York City.
- 1,203,134. Wheel rim. I. T. Ronald, Seattle, Wash.
- 1,203,160. Rubber-covered garter button. A. T. Van Alstyn, New York City.
- 1,203,243. Antiskidding device for wheel tire. J. H. Myers and L. D. Snover, Waterford, Mich.
- 1,203,329. Stethoscope with rubber tubing. C. M. Heck, Raleigh, N. C.
- 1,203,458. Cushion block tire. T. Barnes, Denver, Colo.

ISSUED NOVEMBER 7, 1916.

- 1,203,570. Rubber key top for typewriters. R. E. Beaulieu, Chicago, Ill.
- 1,203,648. Solid tire attachment. M. C. Overman, New York City.
- 1,203,654. Inner tube. L. R. Schaap, Longmont, Colo.
- 1,203,762. Gasket comprising metal and rubber. C. I. E. Mastin, Midland Park, N. J.
- 1,203,898. Pneumatic cushion wheel. O. Mussinan, New York City.
- 1,203,910. Vehicle tire. A. I. Savage, assignor to the Savage Tire Co.—both of San Diego, Calif.
- 1,203,915. Tire with rubber tread and cork body. E. Schmitt, New York City.
- 1,203,985. Pneumatic tire armor. S. T. Culp, Littleton, Colo.
- 1,204,007. Packing for pump rods. B. W. Goodsell, Chicago, Ill.
- 1,204,019. Tire rim. E. Hopkinson, East Orange, N. J.
- 1,204,109. Tire casing with replaceable tread. O. Zarth, assignor of one-half to W. H. McCullough—both of Aurora, Ill.
- 1,204,125. Bottle stopper and rubber dropper. E. J. Brosnan, Troy, N. Y.
- 1,204,237. Cap for fountain or other syringes. E. H. Bickley, Pittsburgh, Pa.
- 1,204,293. Overshoe. C. W. MacWilliams, Geneva, Nebr.
- 1,204,352. Hose coupling. F. Hachmann, assignor of one-fourth to F. C. Schenckler—both of St. Louis, Mo.
- 1,204,365. Rubber boot. C. Lee, assignor to The Goodyear's Metallic Rubber Shoe Co.—both of Naugatuck, Conn.

DOMINION OF CANADA.

ISSUED AUGUST 31, 1916.

- 171,134. Demountable rim. H. J. Trares, Edwardsville, and A. S. Winey, Mishawaka, assignee of a half interest—both in Illinois.
- 171,184. Anti-slipping device for tires. I. C. Hess, Emlenton, Pa.
- 171,208. Nipple. M. H. McMann, New York City.
- 171,273. Non-skid tire chains. W. B. Lasher, Bridgeport, Conn., assignee of H. B. Weed, Syracuse, N. Y.
- 171,276. Corset comprising a plurality of elastic strips. L. J. A. Amyot, Quebec City, Quebec, Canada.
- 171,396. Bust form comprising elastic bands. M. V. Heuchan, Los Angeles, Calif.
- 171,443. Cushion tire. The Estes Anless Tire Co., Newark, and M. E. Annett, J. M. Annett, and E. L. Annett, West Orange, assignees of W. B. Estes, Newark—all in New Jersey.
- 171,444. Pneumatic tire with puncture proof plate. Gatta Percha & Rubber, Limited, Toronto, Ontario, Canada, assignee of C. C. Ferry, Middlebury Center, Pa.
- 171,461. Pneumatic tire casing. R. M. Merriman and A. Micheler, assignee of a half interest—both of Akron, Ohio.
- 171,462. Pneumatic tire with cushion tread. J. C. Markle and C. F. Nast, assignee of a half interest—both of Seattle, Wash.
- 171,469. Tire tread of rubber and blocks of rigid material. W. T. Bogan and W. W. Porter, assignee of a half interest—both of Philadelphia, Pa.
- 171,471. Pneumatic tire with partitioned tube. W. C. Cole and M. F. Stewart, assignees of a half interest—both of Coronation, Alberta, Canada.
- 171,475. Pneumatic tire and molded tube. H. C. Boges, Decatur, Ala.
- 171,483. Pneumatic cord tire. C. L. Archer, Minneapolis, Minn.
- 171,509. Tire casing tube and rim. E. H. Herrick, New York City.
- 171,518. Pressure control for tires. E. B. Keith, Pontiac, Mich.
- 171,527. Tire inner. J. C. Moony, Erie, Pa.
- 171,529. Pneumatic tire. W. D. McNaul, Toledo, Ohio.
- 171,532. Pneumatic tire with tread band comprising spirally corded strands. L. R. Peschadel, Milwaukee, Wis.
- 171,536. Metal inner tube. W. F. Stewart, Pekin, Ill.
- 171,537. Solid tire and rim. W. E. Supernaw, Elgin, Ill.
- 171,585. Rubber glove. J. D. Garvey, Chicago, Ill.
- 171,598. Tire holder. C. L. Keves, Penn. Ind.
- 171,653. Hydraulic tire pump. The United States Rubber Co., Chicago, Ill., assignee of L. O. Bouchard, Philadelphia, Pa.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgements of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 11, 1916.]

9,103 (1915). Combining damaged tire treads to form one good cover. J. B. Gay, 27 Alhambra avenue, Toronto, Ontario, Canada.

9,160 (1915). Elastic band for attaching a mirror to the head of a chauffeur, cyclist, jockey, etc. S. H. Gollan, 9 Portchester Gate, London.

9,199 (1915). Teat cup for milking machine. J. Treloar, Victoria street, Hamilton, Auckland, New Zealand.

9,257 (1915). India rubber springs. R. T. Glascodeine, 77 Canon street, London.

9,263 (1915). Spring wheel with a rubber and canvas tread band. T. Whitehead, Bela Grove, Blackpool, Lancashire.

9,286 (1915). A hollow heel for use on a shoe in which a layer of india rubber extends from toe to heel. E. Magaldi, 10 Via Visconti, Milan, Italy.

101,161. Spring wheel with pneumatic hub and rubber cushions. M. F. Kettler, Houston, Texas.

101,177. Pneumatic hub with rubber cushions. J. Greppi and A. Romanach, 1411 Sarmiento street, Buenos Aires.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 18, 1916.]

17,751 (1914). Tire consisting of an elastic core covered by wire. P. E. H. Forsans, 10 Rue du Pont-Neuf, Brussels.

5,951 (1915). Heel breast burnishing tool composed in part of rubber. J. Gouldbourne, and British United Shoe Machinery Co., Union Works, Belgrave Road, Leicester; and E. Eaves, 33 Dorset street, Wolverhampton.

9,318 (1915). Wheel with solid rubber tire and pneumatic cushion. C. A. James, Prescott Terrace, Rose Park, and F. F. Milford, Portrush Road, Toorak—both in South Australia.

9,319 (1915). Improvement in diving suit valve. Neufeldt & Kuhnke, Werk Ravensberg am Habsburger Ring, Kiel, Germany.

9,404 (1915). Cushion tire. A. S. Miesch, 40 Crompton Road, Handsworth, Birmingham.

9,435 (1915). Athletic blouse with elastic waist band. A. Perry, Behring House, Argyll Place, Regent street, London.

9,440 (1915). Tire built up of blocks of rubber and enclosed in a cover. E. J. Mitchell, 55 Harman street, Brooklyn, N. Y.

101,232. Toy in which pieces of elastic stretched on a frame produce a musical note when swung through the air. A. J. Herne, 41 Berners street, Oxford street, London.

101,241. Reservoir pens. D. Cameron, Waverley Works, Blair street, Edinburgh.

101,257. Hose coupling. G. J. Winter, 686 East Utica street, Buffalo, N. Y.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, OCTOBER 25, 1916.]

9,640 (1915). Explosive shells comprising an inner packing of cork and rubber. P. Pomeon and J. Pomeon (trading as Pomeon et ses Fils, A.), Saint Chamona (Loire), France.

9,699 (1915). Rubber rollers in apparatus for painting metal sheets. H. Folland, Brandeg, and W. Griffiths, 2 High street—both in Glamannan, Carmarthenshire.

9,737 (1915). Puncture repairing plug for pneumatic tires. F. Merricks, 5 Great Winchester street, London.

9,827 (1915). Elastic webbing used to accommodate a hat to heads of different sizes. F. E. English and M. G. Wiener, 1700 Washington avenue, St. Louis, Mo.

9,867 (1915). Tire inflating valve. H. S. Land, 75 Old Road, Lee, Kent.

101,294. Metal tread bands for pneumatic tires. T. Duysens, 21 Gubbelsstraat, and R. Hustinx, 10 Spoorweglan—both in Maastricht, Holland.

101,317. Cushion tire. J. C. Anderson, Cochran Hotel, Fifteenth street, Washington, D. C.

101,320. Means employing rubber for retaining dentures in the mouth. G. E. Arnold, 67 West Hill street, St. Leonard's-on-Sea; H. H. Arnold, Northlands, Hollington, Hastings, and J. C. Arnold, 2 The Haven, Sandhurst Lane, Little Common—all in Sussex.

101,323. Inflated rubber lining for footwear and other wearing apparel. R. Harradine, Broad Street House, New Broad street, London.

101,328. Reservoir pens. C. H. Dunn, "Bank" House, Kew, Surrey.

101,341. Rubber pad device for cleaning safety razor blades. C. J. Kennedy and W. W. Blackshaw, 318 West Second street, Duluth, Minn.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 1, 1916.]

10,041 (1915). Puncture preventing metal band to be inserted between the air-tube and outer cover of a tire. J. G. Jorgensen, 1 Jyllandsgade, Horsens, Denmark.

10,082 (1915). An artificial ankle without joints, tendons or pivots comprising a rubber block. J. B. Hiliard, 157 Hope street, Glasgow.

10,132 (1915). Motor vehicle wheel with a flanged rim for use on rails, and a rim of lesser diameter on which a pneumatic tire is secured for use on ordinary roads. C. A. Dunham, 689 Asylum avenue, Hartford, Conn.

10,197 (1915). A rubber and canvas protective band for insertion between the air tube and cover of a wheel tire. R. W. David, 1340 Westmoreland street, Philadelphia, Pa.

10,220 (1915). Rubber in automatic vent valves. A. E. Bezant, 11 Leonard Road, Landport, Portsmouth.

10,232 (1915). Abdominal belt. P. A. E. Faure, 3 Rue Mirepoix, Toulouse, France.

101,353. An outer fabric cover for pneumatic tires. F. Duysens, 21 Gubbelsstraat, and R. Hustinx, 10 Spoorweglan—both in Maastricht, Holland.

101,401. Horse shoe pad. T. Wood and M. Wood, 35 Mauldeth Road, Withington, Lancashire.

THE FRENCH REPUBLIC.

PATENTS ISSUED (With Dates of Application).

480,550 (December 14, 1915). Automatic life-belt with watertight compartments. T. Ingaramo.

480,580 (December 30, 1915). Cylindrical air chamber closed by a press-button. Proust and Bonnin.

480,590 (April 16, 1915). Tread surface of wheel formed by supporting rubber cones. J. Spyker.

480,618 (October 19, 1914). Protective device for solid rubber and pneumatic tires. W. Ditzmann.

480,681 (January 13, 1916). Elastic wheel. J. Ollagnon.

480,716 (January 19, 1916). Improvements in pneumatic tires. M. J. Stevenson.

TRADE-MARKS.

THE UNITED STATES.

93,724. Representation of a swan-shaped automobile and chauffeur against a scenic background above the words SWANSON SUPPLY CO., on the automobile the word PARAGUM and below TRADE MARK—adhesive material used for repairing rubber goods, especially rubber tires. A. Swanson, Seattle, Wash.

94,010. Representation of a head and shoulders, and below the words LADY CLARE—dress-shields. Forbes & Wallace, Springfield, Mass.

95,440. The word DUNHAM—rubber linings, etc. The Dunham Mills, Inc., Hartford, Conn.

96,964. The word WALKONAIR—shoe heels. A. L. Runyan, Waterloo, Iowa.

97,112. The word HOPSIES—inflatable rubber toys, balls, balloons, etc. G. Borgfeldt & Co., New York City.

97,164. The words WHY NOT—golf balls. W. T. Henley's Telegraph Works Co., Limited, London Wall, London, England.

97,235. Two oval lines, one within the other, in the center the word CHARLOTTE, between the lines the words JONES' OFFICIAL SKATING BOOT—boots and shoes with rubber, felt and leather soles. George R. Jones Co., Manchester, N. H.

97,390. The word RIB-SKID—pneumatic rubber automobile tires. Beacon Tire Co., Inc., Beacon, N. Y.

97,550. The word TEXTAN—soles composed partly of rubber, for boots and shoes. The B. F. Goodrich Co., New York City.

97,552. Two circles, one within the other, and across the center the representation of a shoe sole—soles composed partly of rubber for boots and shoes. The B. F. Goodrich Co., New York City.

97,576. The words WHY and NOT forming a circle around a mark of interrogation—golf balls. W. T. Henley's Telegraph Works Co., Limited, London Wall, London, England.

97,740. Representation of two medals, one on each side of the words GOLD MEDAL—elastic tapes. Samstag & Hilder Bros., New York City.

80,838. Representation of a rubber boot consisting of a narrow white band around the upper edge of the boot, and the body being of a contrasting color—rubber boots. The B. F. Goodrich Co., New York City, and Akron, Ohio.

80,839. Representation of a rubber boot consisting of a narrow green band around the upper edge of the boot, the body being of a contrasting color—rubber boots. The B. F. Goodrich Co., New York City, and Akron, Ohio.

80,840. Representation of a rubber boot consisting of a blue band around the upper edge of the boot, the body being of a contrasting color—rubber boots. The B. F. Goodrich Co., New York City, and Akron, Ohio.

96,845. The word PHYBUR—a rubber composition in the shape of soles and heels for shoes. The Manhattan Rubber Manufacturing Co., New York City.

96,846. The word PARANITE—belting made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.

97,269. The word SAFETY—rubber gloves for domestic use. F. Chapman, Providence, R. I.

97,642. The words BLUE STEEL—rubber boots and shoes, overshoes, and rubber sole canvas shoes. Hood Rubber Co., Watertown, Mass.

97,932. The words FLINT ROCK—rubber overshoes and boots. Sears, Roebuck & Co., Chicago, Ill.

94,224. Representation of a wheel and pneumatic tire and in the center the word AUTIFI—tire fillers. The Autifi Co., San Francisco, Calif.

96,826. The word DELHI—belting, hose and machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.

96,830. The word FULTON—hose and machinery packing made partly of rubber and partly of cotton. The Manhattan Rubber Manufacturing Co., New York City.

96,939. The word KEDS—rubber, leather, and fabric boots and shoes. United States Rubber Co., New Brunswick, N. J.

- 97,391. The word BEACON—pneumatic rubber automatic tires. Beacon Tire Co., Inc., Beacon, N. Y.
- 97,496. The word BRONCH—belting, hose, and packing. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,497. The word CINCINNATUS—belting, hose and packing. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,499. The word ARNO—belting, hose, packing and brake band lining. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,500. The word NORRA—belting, hose, packing, and fruit jar rings. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,501. The words OLD CROW—belting, hose, packing and fuller-balls. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,504. The word FIDELITY—belting, hose, packing, and fruit jar rings. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 97,597. The words PACE MAKER—belting and hose. The Cincinnati Rubber Manufacturing Co., Norwood, Ohio.
- 88,742. Picture of a man stepping over a boot, and the words WALK OVER—boots and shoes of rubber, etc. G. E. Keith Co., Brockton, Mass.
- 93,733. Representation of a piece of wire with two longitudinal ridges—insulated wire. Atlantic Insulated Wire & Cable Co., Jersey City, N. J.
- 94,741. The word GENERAL—rubber tires, tire casings, and inner tubes for pneumatic tires. The General Tire & Rubber Co., Akron, Ohio.
- 97,244. The word TATELEC—waterproofed fabric. Tate Electrolytic Water Proofing Co., Inc., New York City.
- 97,245. The word TATELEC—waterproofed threads and yarns. Tate Electrolytic Water Proofing Co., Inc., New York City.
- 97,978. The word PENSLAR—hot-water bottles and fountain-syringes. Peninsular Chemical Co., Detroit, Mich.

THE DOMINION OF CANADA.

- 21,920. Word OUTING in script type with a flourish beneath on which the words TRADE MARK appear, below being displayed the initials G. P. & R. LTD.—footwear constructed wholly or in part of rubber, rubberized fabrics or rubber substitutes. Gutta Percha & Rubber Limited, Toronto, Ontario.
- 21,922. The word AVON—types of india rubber. The Avon India Rubber Co., Limited, Rubber Works, Melksham, Wiltshire, England.

THE UNITED KINGDOM.

- 372,795. A blue flag with a white cross in its field, Chinese characters and the word Ewo, their phonetic rendering in English—balata machine belting. Matheson & Co., Limited, London, E. C.
- 373,606. A drawing showing tires before and after being repaired, with the signature of Charles P. Salisbury, and the words BEFORE AND AFTER—vulcanized rubber tires and tubes and materials for repairing such tires and tubes. Salisbury's Tyre Repairing Co., Cardiff, Wales.
- 371,985. The drawing of a crab with the word CRABBLE—rubber goods, including tires. Components, Limited, Birmingham.
- 372,725. The word CINCINCHER—rubber substitute of vegetable composition. The North British Rubber Co., Limited, Edinburgh.
- 372,939. A label comprising a thistle, scales and swords, and the words DENTAL GOLDEN FLEECE RUBBER—vulcanite in sheets for forming plates of artificial teeth. The North British Rubber Co., Limited, Edinburgh.
- 373,438. The word MATTA—tires and tire treads, and goods of like kind, made of rubber. Pearson Brothers, Bournemouth.
- 373,446. The word WHIPPE—golf ball. A. S. Spalding & Bros., Limited, Putney, London, S. W.
- 373,776. The word SLEUTH—cycle and motor cycle tires of rubber. J. G. Graves, Limited, Sheffield, Yorkshire.
- 373,905. The word NICO—balata soles for boots and shoes. Norman Isherwood & Co., Bolton, Lancashire.

THE FRENCH REPUBLIC.

- 165,321. The word COCORICO—rubber tobacco pouches. Mathis, Paris.
- 165,379. The name LE FOURIER—military pouch for proofed material. Jeanne Mortagne, Paris.
- 165,400. The word FACTOR—rubber heels. Société Cousin et Cie., Levallois-Perret, Seine.
- 165,419. The number "520"—rubber tobacco pouches, suspenders, general rubber goods. Arnoux, Paris.
- 1,371. The word FLAMPEAU—rubber tobacco pouches. Cernoy-Verignet, Saint-Clément, Jura.
- 1,372. The word TAMARIS— Same.
- 1,373. The word TRIANON— Same.
- 1,374. The words LA JUANITA— Same.
- 1,375. The word ORSAY— Same.
- 1,376. The word NELSON— Same.
- 1,377. The word MONTMARTE— Same.
- 1,378. The word MUSARDISE— Same.
- 1,379. The word OXFORD— Same.
- 1,380. The word TOURNOL— Same.
- 1,381. The word SOFT— Same.
- 24,085. The word FIRESTONE—all kinds of rubber goods. The Firestone Tire & Rubber Co., Akron, Ohio.
- 162,279. The word RUBY—rubber erasers. Léon Reboul, Paris.
- 162,280. The words ROYAL-DIAMANT— Same.
- 162,281. The words ROYAL RUBBER— Same.
- 162,282. The word PARA— Same.
- 162,283. The word NÉOLINE— Same.
- 162,713. The word PARLO—waterproofed garments. P. Duffo, Paris.
- 162,740. The words LE BLINDÉ—tires. François Delboye, Paris.
- 162,741. The word PHÉBUS—water-proofed sleeping bags. Léon Dupuis, Paris.

NEW ZEALAND.

- 13,356. The word RONOLEKE—water bottles, air and water beds, cushions, and pillows manufactured from india rubber. The Firm Trading as Sangers, 258 Euston Road, London, N. W., England.
- 13,380. The word HIPRESS—rubber boots and shoes. The B. F. Goodrich Co., New York City.

DESIGNS.

THE UNITED STATES.

- 49,763. Rubber brush. Term 14 years. Patented October 17, 1916. O. Eick, St. Louis, Mo.
- 49,764. Rubber brush. Term 14 years. Patented October 17, 1916. O. Eick, St. Louis, Mo.
- 49,797. Ornamental design for a sign or similar article. Term 14 years. Patented October 24, 1916. R. Griffith, Akron, Ohio.

DESIGNS FOR TIRES.

UNITED STATES.

- 49,754. Vehicle tire. Term 3½ years. Patented October 17, 1916. E. P. Altenberg, East Palestine, Ohio.
- 49,786. Tire tread. Term 14 years. Patented October 17, 1916. W. S. Vorhis and V. A. Parker, Akron, Ohio, assignors to The B. F. Goodrich Co., New York City.
- 49,792. Vehicle tire. Term 14 years. Patented October 24, 1916. G. W. Beldam, Ealing, England.

- 49,811. Tire. Term 3½ years. Patented October 24, 1916. C. A. Westover, Youngstown, Ohio.
- 49,836. Vehicle tire. Term 14 years. Patented October 31, 1916. E. H. Trump, assignor to The Sebring Tire & Rubber Co.—both of Sebring, Ohio.

NEW TYPE OF DIRIGIBLE BALLOON.

The war has developed in Europe a new type of dirigible balloon which is being used in great numbers. This consists of what is practically an aeroplane body with its motor and propeller supported by a cigar-shaped gas bag made of rubberized fabric about 130 to 175 feet long and from 30 to 40 feet in diameter at its widest point; it has places for 4 passengers, carries fuel for 6 hours, can climb to an altitude of approximately 3,000 feet and has the ability to travel 60 miles per hour.

Naturally the radius of action of these small dirigibles is limited as compared with that of Zeppelins, but they are well suited to patrolling at night when the use of aeroplanes is difficult, owing to the necessity to keep going while in the air and the dangers of landing at high speed in the dark.

Night is ideal for dirigibles, as the temperature is usually constant and not subject to fluctuations which occur in the day when the sun may shine at one moment and a little later be hidden by clouds, thus affecting the volume of gas in balloons and disturbing their equilibrium. At night a dirigible can navigate silently and keep sharp lookout for hostile machines.

The new type of dirigible here mentioned is widely used by the Entente Allies for sea patrol and has proved to be very useful for detecting submarines and for general harbor and navigation defense work. The fabric of the supporting part is both gas and waterproof, and the machines can be anchored in the open or housed in comparatively small sheds.

It appears that balloons of this type might be successful in this country for both military and pleasure purposes. They are said to cost about 60,000 francs [\$12,000], and for more than 18 months have been patrolling the English Channel, collaborating with destroyers in protecting the troops traffic between England and France.

Review of the Crude Rubber Market.

Copyright 1916.

NEW YORK.

THE upward trend in the market that commenced late in October has continued through November, and prices have steadily advanced. All grades of crude rubber have been in good demand, which is believed to emanate from the manufacturers, although dealers' transactions have been equally active. That the market will experience the same violent fluctuations that commenced a year ago this month and ended December 30, in dollar rubber, is wholly speculative. Such disturbances are harmful to the trade in general and experience will doubtless caution the large interests in controlling the market.

Actual information concerning the restriction of London permits is not obtainable, but shipments from that port for some reason have been delayed.

On November 1, Upriver fine, spot, sold in a firm market for 63 to 63½ cents; Smoked sheet ribbed, spot, 63 cents; Amber light, spot, 60 cents, and Upriver fine, spot, was firm at 83 cents. As the month progressed the cabled reports of London's firm position were reflected in the New York market and prices continued upward. The volume of business gradually increased and toward the end of the month trading was quite lively. Spot quotations on November 27 were as follows: First latex, 70 cents; Smoked sheet ribbed, 70 cents, and light Amber, 68½ cents. Para sorts were easier, with Upriver fine at 81 and Upriver coarse at 47½ cents. There was little difference in plantation spot and future prices, and the producers refuse to sell at present levels. It is reported that forward sales are smaller for 1917 than any previous year.

LONDON.

Market conditions, generally, have been firm during the past month with periods of marked activity and fluctuations that have finally resulted in higher price levels. The loss of the "Arabia," early in the month, with 350 tons of rubber on board, had a tendency to support the advancing market. Supplies have not been plentiful, due, possibly, to restricted permits at Singapore and lack of cargo space, and while the London stocks on November 1 were 10,000 tons, the government's requirements of at least 5,000 tons must be taken into consideration. Moreover, England's crude rubber consumption is sure to increase under the proposed plan of industrial expansion now being propagated.

London imports for October were 3,835 tons, against 6,000 tons for September. Liverpool imports for October were 1,143 tons, against 1,160 tons for September.

SINGAPORE.

By mail advices we learn that the export restrictions have had the effect of reducing prices on this market and available supplies were bought up by the dealers. The strong demand for forward positions that followed was met with refusal on the part of the planting companies to sell at artificially depressed prices.

The result of the auctions held November 3, 10, 20 and 25 was as follows: Pale crépe averaged 62.0 cents and Smoked sheet 60.3 cents, showing an average gain during the month of 7.8 cents for Pale crépe and 6.7 cents for Smoked sheet. The amount sold was 1,827 tons, as compared to 2,555 tons a month ago.

BATAVIA.

There was good demand for all grades of plantation rubber at the November auctions with pale crépe leading. Considerable spot rubber was sold in an advancing market. Futures were very dull due to the apathy of the producers. Later in the month the market became very active and prices advanced.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and November 28, the current date:

COMPARATIVE NEW YORK PRICES FOR OCTOBER.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

There is practically no change to report in the Commercial Paper market for November from the conditions prevailing in October, the demand having continued good, with the best rubber names selling at 4@4½ per cent, and those not so well known 4½@5 per cent, and some 5½ per cent.

SINGAPORE.

GUTHRIE & CO., LIMITED, Singapore, report [October 3, 1916]:

A strong demand was again experienced when the sale was resumed this morning. Standard sheet sold up to \$124, an increase of \$1 from yesterday's best. Standard crepe was unchanged. Medium and lower grade crépes were if anything slightly higher and all parcels sold readily. Of 654 tons offered 456 tons changed hands. The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed smoked...	\$120@124	2/ 4 1/2 @ 2 5/8	58.28@59.80

EXPORTS OF CEYLON GROWN RUBBER

(From January 1 to October 9, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States	11,736,404	19,606,725
Canada and Newfoundland	384,940	6,720
France	379,873	1,299,994
Russia	332,200	248,874
Italy	1,868	1,868
United Kingdom	18,561,024	16,404,892
Australia	621,977	756,361
India	1,000	1,388
Straits Settlements	119,933	43,680
Japan	245,211	256,789
Totals	32,382,561	39,234,976

(Same period 1914, 25,744,812 pounds; same period 1913, 19,161,808.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 2,410,071 pounds from the Straits Settlements and 572,684 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of October as 5,968 tons against 6,376 tons in the previous month and 4,120 tons in the corresponding month last year. This gives a total of 50,270 tons for ten months of the current year against 34,777 tons in 1915 and 24,447 tons in 1914. Appended are the comparative figures:

	1914.	1915.	1916.
January	2,584	3,473	4,471
February	2,364	3,411	5,207
March	2,118	3,418	4,429
April	2,151	2,777	3,914
May	2,069	2,708	3,956
June	2,306	3,403	5,114
July	2,971	3,687	5,053
August	1,850	3,796	5,782
September	2,879	3,984	6,376
October	2,897	4,120	5,968
Totals	24,447	34,777	50,270

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore gives the figures of the export of plantation rubber from Straits Settlements ports during the month of September as 2,987 tons against 3,246 tons in August last and 4,725 tons in the corresponding month last year. This gives a total of 34,951 tons for nine months of the current year against 24,953 tons in 1915 and 13,017 tons in 1914. The following are the comparative figures:

	1914.	1915.	1916.
January	1,181	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,477	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
June	1,480	2,249	3,836
July	1,584	2,324	5,106
August	1,325	2,295	3,246
September	1,602	4,725	2,987
Totals	13,017	24,953	34,951

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

THE MARKET FOR RUBBER SCRAP.

Copyright 1916.

NEW YORK.

RUBBER scrap has been firm during the past month, with the principal interest centered in boots and shoes. The upward tendency of crude rubber has had a strengthening effect on the rubber scrap market, and, with few exceptions, boots and shoes are the only commodities that have advanced materially. These show a gain of $\frac{3}{8}$ to $\frac{1}{4}$ cent over the delivered price quoted a month ago.

The mills are reported to have bought quite heavily in some localities, but the volume of business transacted has not been sufficient to advance prices generally. Supplies are reported to be below the average, and, moreover, it is generally expected that at this time of the year collections will diminish. From the number of inquiries it is believed that the mills are considering replenishing their stocks, which are supposed to be low. Now that rubber mills are in the market for crude rubber there is reason to believe that reclaimers will soon follow, for reclaimed rubber is the principal filler used in rubber manufacture.

BOOTS AND SHOES. That the reclaimers have paid as high as 97½ cents, delivered, for this material is questioned; however, it is reported that orders have been filled at 93¼ cents, delivered. Both trimmed and untrimmed arctics were firm at 7½ and 6½, respectively.

AUTO TIRES. Mixed tires have shown the most strength under a fairly good demand at 6¾ to 67½ cents, delivered. There has been little interest taken in white G. & G. tires and prices are unchanged. Bicycle and solid tires have moved fairly well during the month and show a slight advance in price.

INNER TUBES. There has been very little doing in the various grades of tubes other than the usual movement in No. 1 grays and reds at prices ruling a month ago.

MECHANICALS. Nothing of importance has developed in this material, although hose received some attention during the month. Prices are about the same as last month.

London imports of waste and reclaimed rubber for October were 167,800 pounds; Liverpool, 30,000 pounds. Exports from London were 971,600 pounds; Liverpool, 465,700 pounds.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1916.

NEW YORK.

THE cotton market has been subject to violent fluctuations during the past month and 20-cent cotton found ready buyers. The continued improvement in trade demand, combined with active buying in New York by Liverpool interests, were the attributed causes. Late in the month, however, the market became heavily long on both sides of the water and stop order selling was indulged in freely both in New York and Liverpool, on November 23, forcing prices down 96 points—a drop of \$4.80 a bale.

The opinion is freely expressed that 20-cent cotton is too high; that the mills are supplied with stocks, and therefore able to stay out of the market for some time. Moreover, it is pointed out that there is no actual shortage just now and only fear of shortage is the market's disturbing factor.

Under heavy buying on November 25, futures advanced 50 points, establishing prices within 11 to 19 points of the recent high record values, and wiping out the losses of \$5 to \$6 a bale in the interim.

EGYPTIAN COTTON. Fluctuations in Egyptians have been more violent than in the case of Americans. Mail from Alexandria under date of October 23 advises that the market, influenced by the firmness of Americans and that of Egyptians in Liverpool, combined with the reduced Egyptian crop estimates, forced contracts to \$30. The spot market has been very active and the volume of business quite fair, with prices about \$2 higher than contracts. A record price of \$40 was paid for Sakellarides. The tone of the market has been firm, and easier conditions are not anticipated unless some setback should occur.

Total exports from Alexandria for the period, August 1 to October 11, were 47,721 bales, of which Great Britain imported 36,271 bales; the Continent, 8,907; the United States, 2,233 bales; India and Japan, 310 bales.

SEA ISLAND COTTON. Both the Savannah and Charleston markets have been very active during the month and prices have advanced rapidly, showing a gain of 10 cents since our report last month. Heavy buying has been done at 50 cents and holders are asking 55 cents, which will doubtless be obtained should present conditions continue. Savannah stock on November 17 was 10,518 bales, against 13,507 bales a year ago. At Charleston the stock was 767 bales, against 1,149 bales a year ago.

MECHANICAL DUCK. The demand for hose and belting duck has been active; prices have advanced 2 cents a pound during the month and are closely approaching the 40-cent level. While the present prices seem high, the present market trend would indicate higher prices after the first of the year. The duck market has broadened out to a surprising degree, due to the shortage of leather, and manufacturers are substituting cotton duck wherever possible.

SHEETINGS, OSNABURGS, ENAMELING DUCK AND DRILLS. Comparatively speaking, there appears to be a somewhat easier market condition than last month for sheetings and Osnaburgs, although the demand is active at advanced prices and contracts call for March delivery. Drills are in good demand and prices have advanced. The mills have nothing to offer until the end of February. Enameling duck continues firm at advanced prices, with contracts dated May 1, 1917.

TIRE FABRICS. The advance in the price of building fabrics shows a gain of 15 to 20 cents for combed Sea Island and combed and carded Egyptian fabrics. Peelers have advanced 5 cents during the month. That still higher prices in the entire list are confidently expected is based on the belief that the Egyptian market is being manipulated. Sakellarides is higher than Sea Island, an unusual condition. No firm offers were being made, due to the uncertainty of raw materials.

During the last of the month easier market conditions were noted and it was reported that buyers who were prepared to pay

the prevailing high prices were accommodated. Possibly some of the large consumers have found it an advantage to release some of their contract deliveries.

That this market is being broadened by the shortage of leather is shown by the substitution of Sea Island fabric for the uppers of ladies' footwear.

However, the tire fabric situation is still under the influence of abnormal raw material conditions that bespeak uncertainty to consumers who are not covered.

THE MARKET FOR CHEMICALS AND COMPOUND- INGREDIENTS.

Copyright 1916.

GENERALLY speaking, the demand for rubber chemicals has been active during the past month with a strongly marked tendency toward higher prices. Business has been good, inquiries for the most important ingredients in the list have been numerous, and the indications are that manufacturers have been buying freely. The well-known shortage of ocean bottoms has resulted in delayed arrivals of foreign materials and there appears to be no assured relief in the immediate future. The situation, moreover, is complicated by domestic freight embargoes due to car shortage and congestion in certain shipping points. While these conditions prevail it will be obviously difficult to secure prompt supplies of rubber chemicals.

ACCELERATORS. Hexamethylene Tetramine is one of the new organic vulcanizing accelerators that have attracted considerable attention recently. It is quoted at 65 cents a pound in lots of not less than 100 pounds.

BARYTES. Prices have advanced under the steady demand for this material and further advances are confidently expected within the next three months.

DRY COLORS. All grades have been firm, due to scarcity of the basic materials. Chrome yellows and greens are exceptional in that they are comparatively low in price. Adulterated colors are at present bringing unusually high prices.

ZINC OXIDE. Contract prices on American process, "Horse Head," brands for the first half of 1917 are the same as a month ago. French process, green, red and white seal have advanced 4 cents, respectively.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE RUBBER SYMPOSIUM POSTPONED.**

THE Rubber Symposium which was planned for the afternoon of January 8, Rubber Club Day, has been postponed. It was found that the day would be so full of business meetings, election of officers and features connected directly with the work of the Club, that little time would be left for the symposium. The plan has not been given up, however, and in connection with some later Club function it will undoubtedly be carried into effect.

ELECTRIC POWER IN THE RUBBER INDUSTRY.

ELECTRIC power has become a tremendous factor in American manufacturing. The individual motor has eliminated the great first cost, darkening and dirt-gathering propensities of overhead shafting, pulleys and belting, which consume considerable power and must be kept turning even though only a few machines are

being used. The electric motor entails no power drain except when the particular machine attached to it is in operation. That rubber manufacturers have been quick to avail themselves of these advantages is shown by the Census of Manufactures for 1914, the latest available figures of the Department of Commerce. It appears that of the 199,543 total primary horse-power employed in the manufacture of rubber goods in the United States, 114,803, or 57.5 per cent, is electric. The further fact that of this 114,803 horse-power 33,983, or 42 per cent, is rented, instead of being generated in each establishment, clearly indicates the importance of an article entitled "Late Developments of the Electric Drive in Rubber Mills," on another page of this issue.

THE AMERICAN RUBBER INDUSTRY AFTER THE WAR.

A PARAGRAPH in the economic convention between the Allied Nations, drawn up in Paris last summer, is becoming a source of increasing concern to the American rubber trade. It reads as follows:

The Allies declare themselves agreed to conserve for the allied countries, before all others, their natural resources during the whole period of commercial, industrial, agricultural and maritime reconstruction, and for this purpose they undertake to establish special arrangements to facilitate the interchange of these resources.

It is an indisputable fact that the future of the great American rubber industry, which uses two-thirds of the world's production of crude rubber, rests with the British Government. There is not enough Para rubber to supply the wants of this country, even if every pound of it came here, and all the rubber grown in the Malay States, Sumatra and Java is completely in the hands of England and Holland. The British Consul General in New York is able to satisfy present requirements, and while it is unlikely that England or Holland would deny such an important customer as the United States, there is always that possibility. Opinion differs among American business men as to the probable outcome. Some are doubtful if the Allies will be able to carry out their program of preferential trading, whereas others express the growing fear that the restrictions imposed upon American importers on the plea of maritime necessity will be continued after the war, when England, Germany and the United States will all be keen competitors for world trade. In this race for business it is realized that England will have a big advantage, for through her present control of the imports of raw materials she has ascertained by whom sold, the prices paid and ultimate destination of all goods manufactured with raw materials coming from British possessions. She has built up in this country a strong machine for the control of our war trade, which might be

used to regulate our imports to the requirements of the Allies after the war and thus see to it that their needs and interests have priority over all others.

Consul General Clive Bayley, however, is discreetly silent regarding the future policy of the Allies with respect to crude rubber imports as affected by the Paris Convention, although the Foreign Trade Council, the Merchants' Association of New York and the American Manufacturers' Export Association are all making inquiries and have lodged pertinent questions with the administration at Washington. Certainly this irksome situation, together with England's contemplated protective tariff, holds possibilities that may prove detrimental to American interests. Viewed in this light the imperative need of an adequate supply of rubber grown within our own borders as soon as possible becomes more than ever apparent. Meanwhile the fourth convention of the National Foreign Trade Council, to be held at Pittsburgh, Pennsylvania, January 25, 26 and 27, has for its purpose the earnest consideration of the many serious problems besetting our foreign commerce, and it is to be hoped that a scheme for a more satisfactory working arrangement may be evolved.

RUBBER AND AN AMERICAN MERCHANT MARINE.

THE rubber industry, dependent as it is upon merchant ships to maintain the supply of crude rubber, looks with approval upon the tendency toward control of American shipbuilding manifested by the purchase of the American Shipbuilding Co. by the American International Corporation. Imports from the Far East have already been greatly delayed by the shortage of ships, and it is hoped that this new and broader policy of our greatest American shipbuilding company may relieve the situation.

The need of such a course is seen in the fact that almost every great nation except the United States has followed the example of the British admiralty in forbidding the transfer of ships to another flag for a period of three years after the close of the war. American owners and shipbuilders, on the contrary, may sell where they please until the new shipping act goes into effect, and afterwards as soon as the Shipping Board's appropriation for the purchase of ships has been exhausted. Thus the whole world is free to buy ships of us, while we can have only those we build ourselves, and our growing foreign trade is to a degree in danger for want of bottoms in which to transport it. Of the 1,300,000 tons of merchant ships under contract in American yards over 300,000 tons are being built on foreign account, and it is certain that wider control of the shipyards by American shipping interests will tend to build up an American merchant marine and supply one of our greatest needs.

At the outbreak of the war the world's merchant shipping amounted to about 49,000,000 tons, and at the normal rate of increase should now be 53,000,000 tons. As a result of losses by submarine destruction, the

unusual amount of repair work and greatly increased naval construction, it is estimated that the supply of ships cannot be restored to normal before 1922. Meanwhile war conditions in England have raised the cost of ship construction to equal that in the United States, and American shipping interests now see their opportunity to enter this field on equal terms. In the past our shipbuilders have never had under construction enough ships of one type to permit the introduction of methods and economies ordinarily practiced in bulk production. Systematized process manufacturing has enabled America to turn out reapers, automobiles, tractors, etc., more cheaply than any other nation, and shipbuilders feel that the opportunity at last presents itself to apply similar methods to their line as well.

COTTON AND THE 1917 TIRE FABRIC DEMAND.

RUBBER and cotton are the two staple raw materials of primary importance for the manufacture of automobile tires. In 1916 the American tire industry alone consumed practically half the world's 1915 production of crude rubber, and 85 per cent of the United States Sea Island cotton crop. It is estimated that 25,000,000 tires will be made in 1917. But the yield of plantation rubber has advanced to meet it, and while the supply of Sea Island and Egyptian cotton will probably be adequate, there are shipping difficulties and questions of loom capacity that must be considered.

Sea Island cotton has the preference for tire fabrics because of its great strength. Although it is now grown on the mainland of South Carolina, Georgia and Florida near the sea, the entire American crop for the season of 1915-16 ending July 31 was only 91,920 bales, of which 2,727 bales were exported to England and the Continent. About 85 per cent of the American consumption was used to meet the 1916 demand of about 150,000 bales, and Egyptian cotton supplied the rest. The British West Indies, during the past decade, have been highly successful in growing a long-fiber cotton with seed obtained from the famous Colonel Rivers plantation off the South Carolina coast.

In view of the inadequate supply of Sea Island cotton it is not surprising that those forehanded American manufacturers who have gone into plantation rubber in the Far East should turn their attention to the other principal raw material for tire building. Already one large firm has purchased a tract of 10,000 acres in the South on which to grow Egyptian cotton, and the indications are that others will probably enter this field.

Much study has been devoted of late to the idea of providing an adequate rubber supply within our own borders. Long-fiber cotton is equally important; and as the culture of high-grade Sea Island and Egyptian cotton has proved a success along the southern seaboard and in the South, is not its extension to meet our requirements an equally important piece of industrial preparedness?

The Year 1916 in Review.

A RETROSPECT of the twelvemonth just brought to a close leaves no doubt that it has been the greatest year of the rubber industry. Production has increased tremendously in most lines; factory enlargements have become the commonplace news of the day, but the great outstanding feature of the year has been the phenomenal growth of American tire manufacture, which alone consumed practically half the world's 1915 production of crude rubber. While shipments of wild rubber decrease, the production of plantation rubber has increased, and thanks to the British Government, has been obtainable at virtually normal prices despite the extraordinary demands and impediments of the war.

The growth of tire manufacture is graphically reflected in the patents issued. Fully half of the 1916 American patents relating to rubber apply to tires and treads, tire building and repair machines, looms for tire fabrics of special weave, vehicle wheel rims and rim fastenings for the application of pneumatic, cushion and solid tires. There were nearly a hundred patents issued relating to machines used in tire construction. Its growth is also evidenced by record breaking exports, which, for the eight months ending August, 1916, were valued at double those for the corresponding period of 1915, including \$11,772,908 worth of automobile tires, which went chiefly to England, Australia, Russia, New Zealand and Canada. Stock value is always a certain index of the condition of a business, and shares in several leading tire companies that formerly sold below their \$100 par value have recently been quoted at \$257, \$292.50, \$328 and one even as high as \$1,650. During this period of expansion the non-skid tread has triumphed, and there is a marked tendency on the part of motor-car manufacturers to adopt the S. A. E. standardized schedule of tire sizes and oversizes.

Meanwhile, the achievements of rubber chemists have been no less notable. They are rapidly making rubber manufacture an exact science. This is true of improved methods of analysis and aging tests, and particularly so of accelerators. Beginning with the use of aniline oil they have added to the list until 30 or 40 accelerators are now known with which to cut the previous period of vulcanization in half, or better, and thus double production. The advent of pressure cure as a substitute for the orthodox dry heater has notably modified footwear manufacture and may influence the time-honored methods of making clothing, mackintoshes and carriage cloth. Another advance in footwear is the development of combination rubber and fiber or leather soles on a commercial scale, to offset the ever increasing shortage

of sole leather. Improvements have been made in methods of cold vulcanization, and important investigations in Russia indicate the possibility of hot vulcanization without sulphur. American chemists have been struggling with the problem of a new motor-car fuel and believe that by utilization of various by-products and waste, enough industrial alcohol can be provided, which will greatly reduce the cost of solvent naphtha for rubber use. The marked tendency of American chemists toward greater frankness in discussing improved methods for the common good augurs well for the future. In Germany synthetic rubber has been improved but little and apparently no way has been found to reduce its cost, while the attitude of American chemists is largely one of scientific interest.

The war has proved that rubber is not a luxury but a necessity. Its principal uses in warfare are too well known to require enumeration here, but the chief developments of the present conflict are the enormous demand for tires and for rubberized fabric used in the manufacture of army equipment and in the construction of aeroplanes and balloons. There are myriad ingenious uses of rubber, too, but none compares with the marvels of surgery in mending broken soldiers with it—replacing broken noses, jaws and teeth, and grafting skin and flesh to cover them. Its increased applications in the building of artificial limbs are also notable.

The prosperous condition of rubber manufacture in America has rendered possible much highly commendable welfare and educational work, which makes for far greater health and contentment of employes as well as maximum output in the factories. This spirit of improvement has also affected mill conditions from the standpoint of health and safety. The industry has grown so rapidly that for the most part it is conducted in buildings of modern fireproof construction, light, well-ventilated, and equipped with excellent sanitary and safety devices. It is not surprising, therefore, that although minor strikes have been of frequent occurrence, most of them have been settled without difficulty.

The past year has proved a revelation even to the most optimistic and far-sighted rubber men, but with our well-equipped factories, the supply of rubber tolerably assured, the automobile industry still growing, and the nations beyond the seas depending upon us more and more to supply their needs, there is every indication that the coming year will outstrip it. In this connection it is confidently believed that The Rubber Club of America, Inc., will continue to grow in prestige and membership, as it has in the past, and to exert a steady influence of distinct benefit to the whole industry.

A Brief Review of the Organic Accelerators.

The following summary represents an effort to classify the principal nitrogen-bearing accelerators in a logical manner, and to record concisely their characteristics and efficacy as described by K. Ditmar and translated into French for "Le Caoutchouc & la Gutta-Percha" by Georges Noyer; Andrew H. King in "Metallurgical and Chemical Engineering"; S. J. Peachey in "The India Rubber Journal"; and others.

WHATEVER may be the future of synthetic rubber, the investigations in connection with it led to the discovery of organic accelerators, which have revolutionized several lines of rubber manufacture. It was found that synthetic rubber could not be vulcanized without the presence of certain organic catalyzers to facilitate the union of rubber and rubber-like substances with sulphur, and when all natural rubber was substituted the increased rapidity of vulcanization was truly remarkable. The difficulty, as for a time with plantation rubbers, appears to have been the absence of certain so-called impurities found evenly distributed throughout Para rubber coagulated by the Amazon method. These natural catalyzers of rubber latex are believed to be decomposition products and related to the proteins. It is certain that all organic accelerators yet known are nitrogen-bearing and many have amino groups, so that the function of nitrogen appears to be important.

Manufacturers who had been using the old, well-known mineral accelerators began to experiment with these new organic catalyzers and found that they could double their output without expensive increase of steam pressure or danger of impairing the product by high temperature. Those engaged in the production of cheap molded goods discovered that by employing both high temperatures and catalyzers their increased output would take care of overhead as never before.

While this most important recent development in rubber chemistry is still in its infancy, there is already considerable generalization and a goodly amount of definite facts on which to build. It is thought that, unlike the mineral accelerators which undergo no chemical change during vulcanization, an organic catalyzer unites with one of the reacting substances and forms an unstable compound which then reacts with the other substance. Meanwhile the catalyzer is set free and the entire process is repeated. From a mechanical standpoint a catalyzer is most conveniently mixed when a solid capable of being very finely pulverized. A high boiling point is essential to prevent vaporizing during vulcanization and consequent spongy appearance, known as "blowing."

The following list includes the most important organic accelerators now in use:

Carbon bisulphide addition products with

Aniline
Diphenylthiourea or thiocarbonylurea
Dimethylaniline
Tetrahydropyrrole
Dimethylamine
 $\beta\beta$ Dimethyl α methyl trimethylene amine

Ammonium compounds

Ammonium borate
Aldehyde ammonia
Quaternary ammonium bases

Amino compounds

Accelerene or paranitroso dimethylaniline
Para-phenylenediamine
Tetramethylenediamine
Hexamethylene-tetramine or hexamethylenamine or formalin
Sodium amide
Naphthylenediamine
 $\beta\beta$ Dimethyl Δ trimethyleneimine
Trimethylenamine
Benzylamine
Nitrosodimethylaniline

Piperidine and derivatives

Piperidine or aminopentane
Methyl piperidine

Quinoline and derivatives

Quinoline
Quinoline sulphate or quinoline sulphonc acid.
Hydroxy quinoline
Quinosol
Oxiquinoline
Oxiquinoline sulphonc acid
Oxiquinoline sulphide

Miscellaneous

Anthraquinone
Antipyrine
Naphthylamine
Urea derivatives
Anilides
Formanilide
Thioformanilide

Several of these accelerators are covered by patents and cannot be bought of the concerns manufacturing them until a license for their use has been obtained from the patent owners. Applications for such licenses should be addressed to Dr. Hugo Schweitzer, of the Synthetic Patents Co., 115 Hudson street, New York City. Prices will be quoted to license holders. The catalyzers in question are piperidine and methyl piperidine, tetramethylenediamine, hexamethyl-tetramine, thiocarbonylurea, and aniline hydrochloride. The first three of these are not made in the United States at present.

CARBON BISULPHIDE ADDITION PRODUCTS.

With Aniline: Diphenylthiourea, or thiocarbonylurea,

is one of the earliest known organic accelerators. It takes the form of large colorless tablets melting at 154 degrees C., and is a very efficient catalyzer, particularly for quick-curing stocks because it does its work at the very beginning of vulcanization. The proportions used vary from $\frac{1}{2}$ to 3 per cent.

With Dimethylaniline: Cited by Ditmar and King.

With Tetrahydropyrrole: $(\text{CH}_2)_4\text{NH}$. Known as pyrrolidin in Germany. Cited by Ditmar and King.

With Dimethylamine: This substance,

gives an active addition product. With Para, 100 per cent sulphur and the addition of 1 per cent of the compound of carbon bisulphide and dimethylamine vulcanization takes place completely with 15 minutes' cure at 135 degrees C. (German patent 269,512.)

With $\beta\beta$ Dimethyl α methyl trimethylene amine: Cited by Ditmar.

AMMONIUM COMPOUNDS.

Ammonium borate: This has a noticeable effect on the cure, but the fact is only of scientific interest, according to Ditmar.

Aldehyde ammonia: $\text{CH}_3\text{CH(OH)NH}_2$. This very satisfactory catalyzer is readily soluble in water, sparingly soluble in alcohol and almost insoluble in ether. It melts between 70 and 80 degrees C. and sublimes without decomposition at 100 degrees C. Its efficacy as an accelerator, according to King, may be seen in the fact that 100 parts Para, 10 parts sulphur, and 1 part aldehyde ammonia will cure in 30 minutes at 45 pounds steam pressure, 140 degrees C. (Ditmar says 1 hour at 3 atmos-

phers—42 pounds—while without the accelerator 2 hours would be required), whereas 90 parts Para, 9 parts sulphur, and 1 part lime require 85 minutes at the same pressure for a cure.

Quaternary ammonium bases: These are covered by Bayer & Co., patents of 1914 together with aldehyde ammonia, paraphenylenediamine, sodium amide, benzylamine, and naphthylendiamine, all rapid accelerators.

AMINO COMPOUNDS.

Accelerene: This widely used English catalyzer is among the most powerful known accelerators. When used in the proportion of $\frac{1}{3}$ to $\frac{1}{2}$ of 1 per cent it reduces the required period of vulcanization to one-third normal with highly satisfactory results; and in conjunction with certain other familiar substances in quick repair compounds reduces the period of cure to one-eighth normal. Cheap mixings containing considerable reclaim or waste, particularly if golden antimony sulphide be present but no free sulphur, do not respond so readily as medium and high-class mixings. In such cases sufficient free sulphur must be added and the proportion of antimony sulphide may be reduced to that needed to give the desired color, after which the usual acceleration will be attained. In the manufacture of vulcanite the addition of $\frac{3}{4}$ of 1 per cent of accelerene to a mixture consisting of 100 parts rubber and 40 parts sulphur reduced the period of vulcanization from 6 to 2 hours, yielding a hard and very durable product.

Essentially paranitroso dimethylaniline, and wholly different from the German type of accelerators, accelerene owes its activity to the presence of the nitroso group, and not to feeble basic properties. Aside from its high acceleration it possesses several characteristics in use that are of great value. Goods vulcanized in its presence show somewhat greater tensile strength, probably due to the diminished degree of depolymerization possible in so short a period of heating. Vulcanization stops when the goods are taken from the pan or press, so they suffer little deterioration in storage, tests of this now covering a period of two years. Sulphuring-up may also be entirely prevented by its use, though at the sacrifice of acceleration. The quantity of sulphur may be reduced to 3 or $3\frac{1}{2}$ per cent, $\frac{1}{2}$ per cent of accelerene is then added and the mixing cured in the ordinary manner. As employed for this purpose the catalyzer facilitates a complete combination of rubber and sulphur, with the result that little or none of the latter remains in the rubber.

Para-phenylenediamine: $C_6H_4(NH_2)_2$: $\begin{matrix} NH_2 \\ \wedge \\ V \\ NH_2 \end{matrix}$ This very

poisonous catalyzer melts at 140 degrees C., sublimes without decomposition at 267 degrees C., is readily soluble in alcohol and ether, and moderately so in water. In Bayer & Co.'s German patent No. 280,198, January 1, 1914, it is stated that this accelerator gives good satisfaction with synthetic rubber, 100 parts isoprene rubber having been cured completely upon being mixed with 10 parts sulphur, 2 parts paraphenylenediamine and being heated in a press for 15 minutes at 45 pounds steam pressure.

Tetramethylenediamine: $NH_2(CH_2)_4NH_2$ Known also as putrescine, this is a natural product of protein decomposition formed during the putrefaction of animal matter such as fish. It is produced chemically by Bayer & Co.

Hexamethylene-tetramine: Known also as Hexamethyleneamine and *Formin*.

Miscellaneous Amines: Other amino compounds cited by King as of lesser importance yet having some accelerating power include: sodium amide, $NaNH_2$ (rapid acceleration according to Ditmar); naphthylendiamine, $C_{10}H_8(NH_2)_2$ (rapid acceleration according to Ditmar); trimethyleneamine $(CH_2)_3N$; benzylamine, $C_6H_5CH_2NH_2$ (rapid acceleration according to Ditmar); $\beta\beta$ dimethyl Δ trimethyleneimine; and nitrosodimethylaniline.

PIPERIDINE AND DERIVATIVES.

Piperidine or Aminopentane: $C_5H_{10}NH$. A liquid miscible in water in all proportions, having a specific gravity of .881 at 0 degrees C., boiling at 105.7 degrees C., and smelling like pepper and ammonia. This, the prototype of the more recently discovered organic catalyzers, was brought out and patented by Bayer & Co. in 1912 for use in the manufacture of synthetic rubber, but its extraordinary value as an accelerator in connection with natural rubber for both hard and soft rubber articles soon overshadowed its original purpose. A mixture of 100 parts Para and 10 parts sulphur that requires an hour to cure at 53 pounds, steam pressure may be cured perfectly with only 15 minutes' heating by the addition of $\frac{1}{2}$ part piperidine. The product obtained from this compound contains about 3.5 per cent of combined sulphur. Piperidine may also be used for producing hard rubber by adding 25 per cent sulphur. (German patent 266,618.)

Methyl piperidine: $C_6H_{10}(CH_3)$. This active catalyzer boils at 107 degrees C.

QUINOLINE AND DERIVATIVES.

Quinoline: C_9H_7 $\begin{matrix} CH:CH \\ N=CH \end{matrix}$ While this is a good acceler-

ator, its derivatives, the sulphate and quinosol, are more frequently used because of the ease of mixing. Quinoline has a specific gravity of 1.0947 at 20 degrees C.; it boils at 240 degrees C.; and is soluble in alcohol and ether, but only sparingly so in water. Its odor is disagreeable and penetrating; its taste, bitter and acrid; and on exposure to moist air is converted to the hydrate. As an accelerator the amount used is 2 or 3 per cent. Quinoline does not appear to enjoy accelerating power, according to Ditmar.

Quinoline sulphate: Also known as quinoline sulphonic acid. An excellent accelerator yielding good-looking, well-vulcanized rubber. King suggests that the potassium salt of this acid might give better results.

Hydroxy quinoline: This derivative, which ought to prove a valuable accelerator, takes the form of prismatic needles melting at 76 degrees C. and boiling at 266.6 degrees C. under 752 mm. pressure. Although readily soluble in alcohol and volatile with steam it is only sparingly soluble in cold water.

Quinosol: This accelerator takes the form of sulphur yellow needles soluble in both alcohol and water. It is manufactured by Frisch, of Hamburg, Germany, and mixes easily with rubber compounds before vulcanization. In a mixture of Peruvian rubber, 12 kilograms; white substitute, 19 kilograms; Kaolin (China clay), 2 kilograms; chalk, 5 kilograms; and sulphur, 4.5 kilograms, the accelerating effect, according to Ditmar, is not great, but quinosol acts quite differently when mixed with litharge and crude rubber free of substitute, the combined effect being greater than the sum of the effects of each employed alone. This fact is of great importance to rubber footwear manufacturers who use mixtures containing litharge exclusively, as they can cut the period of vulcanization in half by using 2 to 3 per cent of quinosol.

Oxiquinoline: Cited by Ditmar.

Oxiquinoline Sulphonic Acid: Gives good acceleration but very porous rubber, according to Ditmar.

Oxiquinoline sulphide: This is a satisfactory but too active accelerator. It can be used with all sorts of compounds because it answers all the needs of the industry. In tests conducted by Ditmar in collaboration with the Japanese chemist Nawa-Naami, a mixture containing Peruvian rubber, 40 kilograms; brown rubber substitute, 10 kilograms; paraffin, 5 kilograms; chalk, 41 kilograms; and sulphur, 4 kilograms, required 2 hours' heating at a pressure of 4 atmospheres (56 pounds). With oxiquinoline sulphide the mixture was vulcanized in 50 minutes. With quinosol sulphate 75 minutes was required. Tests of accelerated and

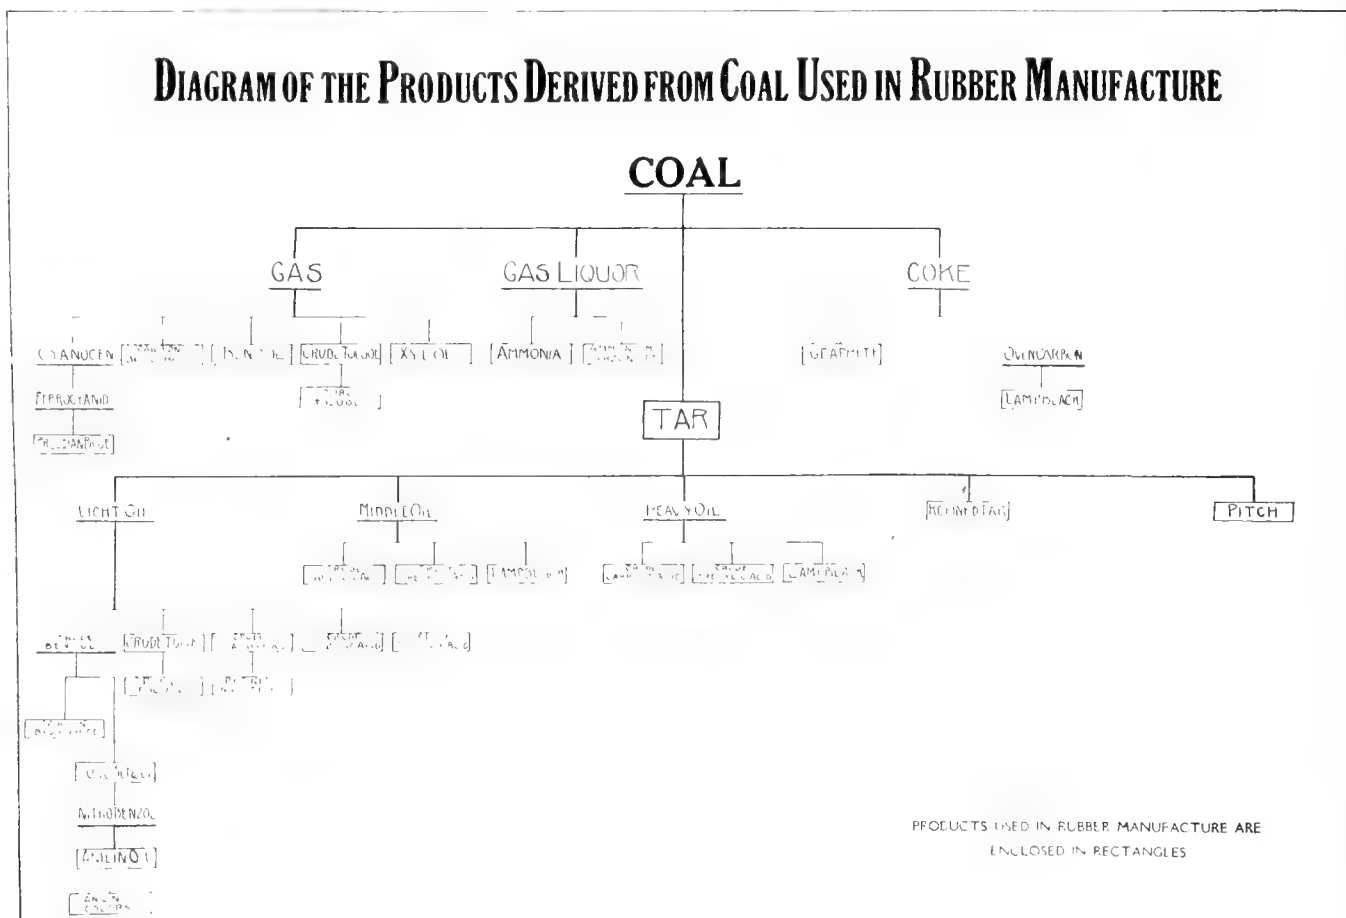

MISCELLANEOUS

Albumen: The direct addition of proteins to rubber, as described by W. Esch in German patent No. 273,482, November 22, 1912, presents an interesting possibility. The protein, usually egg albumen, 15 parts, is mixed with 2 parts hydrated lime or magnesium hydroxide to form a paste. Low grades of rubber, when mixed with this paste, dried, sheeted and smoked to render the albumen insoluble, are considerably improved thereby.

Probably the advancing cost of gasoline and other products derived from petroleum will one day render profitable the distillation of the vast deposits of so-called hydrocarbon shales of the Green river formation of northwestern Colorado and northeastern Utah. The United States Geological Survey has been investigating these deposits for three years past, and the director in his report states that very rough but cautious calcu-

THAT the European war has been principally responsible for our tremendously increased exports of the past year is incontrovertibly shown by the official Commerce Reports of the United States. Our exports for the ten months ending October, 1916, amounted to \$4,443,326,271, of which shipments to the value of \$3,541,446,875 went to the Allies and their colonies, whereas our entire exports to all other countries totaling \$901,879,396, only slightly exceeded one-fourth those to belligerent countries. Considering only commodities suitable for military and naval purposes our export trade for the ten months ending October, 1916, amounted to \$2,541,733,040 as compared with \$549,369,725 for the corresponding period of 1914, or nearly a five-time advance.

COAL-TAR PRODUCTS OCCUPY AN IMPORTANT PLACE IN RUBBER MANUFACTURE. IN ORDER TO GRAPHICALLY SHOW THESE DERIVATIVES AND THEIR SOURCES, THE ABOVE DIAGRAM HAS BEEN CONSTRUCTED FROM DATA COURTEOUSLY FURNISHED BY THE BARRITT CO., NEW YORK CITY.

Late Developments of Electrical Drives in Rubber Mills.

By William H. Easton, Westinghouse Electric & Manufacturing Co.

AS in most other lines of manufacturing, electric power is coming to be widely used in rubber factories, for the individual electric motor to drive each machine has much to recommend it. As a rule, rubber manufacturers prefer to generate their own electric power, believing it more economical,

of the engine room force; the assurance of more reliable power, and lower operating costs.

It would seem, therefore, that many rubber mills might adopt such a system with benefit, and as the installation mentioned presents some interesting departures from ordinary usage, a description of its salient features may prove interesting.

Alternating current at 2,200 volts is received from the central station lines. Part of this current passes through transformers and is reduced to a low voltage for lighting and operating some small motors, but most of it is used at full voltage. Both high and low voltage lines lead to the main switchboard from which the power is distributed throughout the plant.

The motors used in the first three steps of the process are all applied in the same way and are similar in type. Each is a Westinghouse 2,200-volt, alternating current, slip-ring motor, the details being as follows:

Fig.	H.P.	R.P.M.	Machines Driven.
1	100	585	Two 16 x 24-inch Birmingham washers.
Not shown	200	500	Three 20 x 50-inch Birmingham mills.
2	260	500	Two 20 x 50-inch Birmingham warming mills. A 75-kilowatt Westinghouse direct-current generator for supplying current to the calender motor.

It will be noticed that these motors are of the same voltage as the Central Station lines. If motors of lower voltage had been selected it would have been necessary to install transformers, but under the circumstances this expense is avoided. As can be seen from the illustrations, these motors are all enclosed by wire netting so that there is no danger of unauthorized persons coming near them.

Slip-ring motors are used instead of squirrel-cage motors, because a squirrel-cage motor in starting ponderous machinery of this kind draws a very heavy current from the line; but with a slip-ring motor the starting current can be kept down to very nearly the full load value. The motor is started with resistance in the rotor circuit, which is cut out gradually by means of a drum controller as the motor speeds up. The drum controller and resistance handle only the low voltage rotor current. An oil circuit breaker connects the motor to the high voltage line and automatically disconnects it in case of an overload.

In order to stop the washers and mills quickly in case of emergency, each machine is equipped with a Cutler-Hammer magnetic clutch and brake. Safety switches are located convenient

FIG. 1.—HIGH VOLTAGE 100-HORSE-POWER MOTOR DRIVING TWO RUBBER WASHERS.

owing to the fact that large quantities of steam have to be produced for vulcanizing purposes. But electrical engineers have been able to convince several progressive rubber manufacturers that even greater economy lies in another direction and that there are also other attendant advantages. For instance, power for a new and thoroughly modern factory recently erected for the manufacture of automobile inner tubes is not produced at the plant, but supplied by a central station. The advantages claimed for this somewhat unusual service include the saving of the cost of engines, generators, extra boilers and auxiliaries; the ability to obtain power at any time, night or day, without the presence

FIG. 2.—GENERATOR SUPPLYING CALENDER MOTOR; ALSO 200-HORSE-POWER MOTOR DRIVING TWO WARMING MILLS.

to each operator and when any one of these is operated, the clutch opens, disconnecting the rolls from the motor, and the brake is applied to the rolls, stopping them almost instantly. Both brake and clutch are operated by direct current supplied by a small motor-generator set.

A 24 x 66-inch Birmingham calender is driven by a Westinghouse 75-horse-power, 230-volt, direct-current motor supplied with current at both 120 and 240 volts from the generator shown in Figure 2. It is evident that it would be less expensive to drive the calender with an alternating-current motor which could take its current directly from the line and thus eliminate the generator; but a direct-current motor is preferable, because there is no practicable method of getting satisfactory speed variation with an alternating-current motor, whereas with a direct-current motor any desired speed range can be obtained. In the present instance the highest speed of the calender is four times its lowest speed and there are 22 steps between, so that every calendering operation can be carried on at the most suitable speed.

Another interesting point is the use of current at two voltages for this motor. It is easily possible to build a motor that will provide a 4 to 1 speed range on one voltage, but such a motor would cost considerably more than the present one, which provides only a 2 to 1 speed range on each voltage; and since the use of two voltages adds but little to the cost of the generator and the controller, a less expensive outfit is provided.

The calender controller, which is of the Westinghouse automatic type, consists of two principal parts: a drum controller and a panel on which are mounted various automatic switches; while on the calender itself are placed "start" and "stop" buttons. When the operator desires to start the calender he moves the drum controller handle to the notch which he knows from experience will correspond to the speed he desires; he then presses the "start" button. The motor now starts and comes up to speed, the magnetic switches on the panel automatically making the proper connections. Should a change of speed be desired, the controller handle is moved in either direction, causing the motor to change its speed to correspond. Pressing the "stop" button not only cuts off the current but causes dynamic braking connections to be made by the automatic switches, which brings the calender to an abrupt stop. Safety switches, operated by means of ropes hanging down on each side of the calender, stop the calender in the same way.

The Royle tubing machines, which form inner tubes, are driven by 20-horse-power, 220-volt, 685-r.p.m., Westinghouse squirrel-cage motors. The drying rolls, the grinding and buffing wheels, and the machine tools in the machine shop are also motor driven.

NEW POLICY OF BUYING RUBBER-COVERED WIRE.

Manufacturers and jobbers are making a better profit in rubber-covered wire today than ever before. The demand is large and the output is not sufficient. Rubber-covered wire, being a staple, never was very profitable for the jobber. Until quite recently it was sold on a basis of the best price. Thus a buyer would place an order at today's prices, say 21 cents, for four months' delivery. If at the delivery date the prevailing price was 18 cents the buyer expected this price and received it, although the contract was made at 21 cents. If, on the other hand, the price had advanced to 23 cents the buyer held to the contract price of 21 cents. The buyer therefore was protected against any advance in the market but he also received the benefit of any decrease in market prices.

Under such a scheme it was nothing more than heads the buyer wins, tails the seller loses. With the margin of profit always small it often reached the vanishing point on a rising market. Today, however, all of this has been changed. Wire is bought at the delivery market price of copper-wire base. The jobber buys this way from the manufacturer and the contractor from the jobber. The benefits of a rising market are now going to the seller. [Electrical World.]

FOREIGN IMPORT DUTIES ON RUBBER SPONGES.

THE accompanying statement of foreign import duties on rubber sponges imported into the various countries given, has been corrected to December 1.

When two or more rates of duty are shown for the same article, products of the United States, as a rule, are admitted at the lowest rate ("conventional" or "minimum"), except: (1) Into France and French colonies, where, in the case of most articles, the "general" rate is applied; (2) Into Canada, where the "general" rate is applied; (3) Into other British colonies, where the "preferential" rates, if any, are withheld from all non-British imports.

While every care has been taken to insure accuracy, the rates are not guaranteed and it is advisable to make small trial shipments to test them. As changes in the duties are likely to occur at any time, frequent verifications are advised. The surtaxes noted in the South American table have not been added to the rate.

AMERICA'S FIRST NAVAL DIRIGIBLE.

The United States Navy's first dirigible balloon, the DN-1, has been shipped to the Naval Aeronautical Station, Pensacola, Florida, for final flying tests, the preliminary power plant and blower tests having been previously passed by the government inspector at the factory of the constructors, the Connecticut Aircraft Co., New Haven, Connecticut.

The DN-1 is of the non-rigid type, the gas bag maintaining its shape by the pressure of the contained gas, and the gondola being suspended by numerous ropes and cables fastened to the "belly-bands" of the bag.

The envelope of the bag is of double-ply rubberized cotton fabric; strength, 70 pounds per inch for both warp and weft; permeability, 35 cubic feet per 24 hours at two feet water pressure. All seams are extra wide, with double rows of stitching. The ballonets are made of double texture fabric; strength, 40 pounds for warp and weft.

All of the fabric, for both main envelope and ballonets, was furnished by the Cambridge factory of the United States Rubber Co., the shaping of the big bags and the setting-up of the balloon being done in the Naugatuck factory.

What the Rubber Chemists Are Doing.

VARIABILITY OF PLANTATION RUBBER IN TECHNICAL MIXINGS.

THE variability of plantation Para rubber, when vulcanized with various technical mixings in addition to sulphur, has been investigated by Eaton and Grantham, Agricultural Department, Federated Malay States. Their results appear in the "Journal of the Society of Chemical Industry," (October 31, 1916). In the experiments described by them zinc oxide, litharge and magnesium oxide with a small percentage of sulphur were used in several combinations. Vulcanization was effected in molds in a steam-jacketed vulcanizer at 140 degrees C. and tests made with ring specimens on the Schopper-Dalen testing machine.

Regarding the stability of their vulcanized samples kept six months or a year before testing, their experiments show that, with the 10 per cent sulphur mixing the rubber continues to vulcanize slowly during six months. This extra vulcanization represents about a quarter-hour cure at 140 degrees C. A certain amount of deterioration in tensile properties also takes place. While the 10 per cent mixing is excellent to ascertain variations in rate of vulcanization between different rubbers, especially when it is required to test the samples shortly after vulcanization, it is not a good mixing for testing the aging properties of different rubbers after vulcanization, because the large amount of free sulphur gradually exudes, leaving the sample porous and easily oxidizable. The authors append their paper with the following conclusions:

1. The variability of plantation Para rubber in respect to rate of cure continues to exist in various technical mixings in which the rubber is loaded with mineral constituents in addition to sulphur, and also in rubber-sulphur mixings containing different proportions of sulphur.
2. The variability is not of the same degree as with mixings containing 8 to 10 per cent sulphur.
3. The use of strong accelerating agents, such as oxide of lead, tends to obscure these differences which are produced in the raw rubber by the presence of a natural accelerator.
4. Other substances, caustic soda and potash and various organic nitrogenous accelerators, also obscure these differences, since these substances behave in a somewhat similar manner to the natural accelerators present in raw rubber.
5. To illustrate the differences in rate of cure between different rubbers, which is the most important variability in plantation Para "first latex" rubbers, and 8 or 10 per cent sulphur mixing, without other addition, is very satisfactory, although not suitable for stability or aging experiments.

SYNTHETIC RUBBER FROM ALCOHOL.

Ostromyslenski's method of producing erythrene rubber is given in "Chemical Abstracts," as follows: The mixed vapors of ethyl alcohol and air are passed through spirals of copper and silver gauze and the products are converted into erythrene by being passed in a gaseous or liquid state through a series of metal tubes containing aluminum oxide heated to 824 to 860 degrees F. Erythrene is converted into rubber in an autoclave containing a small quantity of a catalytic substance. In order to give the synthetic rubber all the properties of natural rubber it is necessary to add to it certain substances found in the latter. These additions amount to about 15 per cent and consist of pure nitrogenous substances, litharge and colophony, or Canada balsam, as a substitute for the resins of natural rubber.

In connection with the above it should be noted that Dr. Ivan Kondakorr, in a communication to "Le Caoutchouc & la Gutta-Percha" (November, 1916), refers to this synthesis as nothing new and to Ostromyslenski's recently published researches as a confirmation of previous knowledge rather than new discoveries.

VULCANIZATION TESTS.

Two reports made by the Imperial Institute to the Rubber Research Committee in Ceylon (Department of Agriculture Bulletin, Ceylon, No. 23), on vulcanization tests of plantation Para, deal with the following points: (1) The effect of different methods of coagulation. (2) The effect of adding ammonia, sodium bisulphite and formaldehyde to latex before coagulation. (3) The effect of the form of the rubber (sheet, crêpe, etc.)

TENSILE STRENGTH.

The maximum tensile strength of 64 specimens was 2,571 pounds, minimum, 1,607 pounds. Two samples of best fine hard Para gave, in comparison, 2,276 pounds and 2,312 pounds. Rubber prepared by spontaneous coagulation has tensile value equal to that coagulated by acids. Scrap rubber shows low tensile strength in every case. The use of different acids for coagulation has little effect on the tensile strength of the rubber produced. Double the usual amount of acid had no marked effect on the tensile strength. The addition of fractional percentages of ammonia, sodium bisulphite or formaldehyde to the latex before coagulation had no marked effect on the strength of the rubber. Hand-made and machine-made sheets seem to give rubbers of practically equal strength. Thick crêpe is slightly higher in tensile strength than thin crêpe.

ELONGATION.

The elongations at heating point ranged from 787 to 919 per cent. Two samples of best fine hard Para gave in comparison, 880 and 893 per cent.

TIME OF VULCANIZATION.

This was tested on a standard mixing of 90 parts rubber and 10 parts sulphur, vulcanized at a constant steam pressure of 50 pounds.

The results are thus summarized:

Hand-made sheet cured more quickly than machine-made. Crêpe cured more quickly than thin crêpe. Thin crêpe required longer to cure than the corresponding sheet.

Rubber prepared from the same sample of bulked latex by coagulation with different acids had approximately the same time of cure. When double the minimum amounts of acid were used, the time of cure was not much affected.

Addition of ammonia and sodium bisulphite to the latex before coagulation had no constant effect on the time of cure, but an excess of formaldehyde lengthened the time very considerably.

Differences in the tensile strengths of washed and unwashed rubber were comparatively small.

RUBBER OF UNIFORM COLOR.

The production of rubber of uniform color has been specially studied by Clayton Beadle and Stevens and their results published in a paper presented at the Congress of Batavia. In brief they find that such rubber can be produced only by the exercise of special precautions in the coagulation of the latex. It is possible to obtain uniformly pale rubber if the latex is rapidly coagulated by an excess of acetic acid, the coagulum rapidly washed in a machine, followed by rapid drying in warm air or in a vacuum chamber. The reason for this is simple.

Rubber latex contains an enzyme, an oxydase which causes rapid absorption of oxygen from the air by the fresh coagulum. This oxygen reacts rapidly on certain organic substances contained in the latex, producing black coloring matters. Color is not an indication of quality, but manufacturers and dealers regard variations of color with suspicion. For this reason large dealers sort their cargoes and repack for external appearances, with no regard to the sources or origin of the rubber.

A method for obtaining rubber of uniform color, originally tried in Ceylon, consists in boiling the fresh coagulum, in pieces the size of one's fist, for 10 or 15 minutes in water. The heat destroys the enzyme and the rubber loses the property of blackening on exposure to the air. While the rubber is pale the boiling makes it sticky and more difficult to dry.

A third method consists in using small amounts of antiseptic substances to arrest the action of the enzyme. Among these, formaldehyde and bisulphite of sodium are commonly used. The percentages required are extremely small. After accomplishing their work they are removed from the rubber by washing in the crepeing machines.

Bisulphite of soda has no bleaching action on the rubber itself and is not able to destroy coloring material already formed. It simply prevents the action of the ferment. It is an antiseptic and not a bleaching agent. Vulcanization tests show that rubber prepared with an excess of acid is inferior to that prepared with the minimum of acid. The same is true of boiled rubber. Rubber treated with bisulphide loses nothing of its quality and is scarcely distinguishable from untreated rubber.

BLEACHED RUBBER.

The influence of hydrosulphites on strongly colored crêpes has been studied by André Dubosc (Le Caoutchouc & la Gutta-Percha). The rubber was subjected to the action of sulfoxylate aldehyde of sodium, both hot and cold. Decoloration was more rapid under the former condition, especially in the presence of a small quantity of bisulphite of soda. Air dried, the samples do not remain absolutely white, but turn yellowish, although much paler than the initial color.

Sulfoxylates, and in general all the hydrosulphites, act on the coloring matter of rubber and by hydrogenation transform it into a leucobase, even if the coloration is old.

The accidental coloration, observed by Stevens and Clayton Beadle in the coagulation of latex, Dubosc concludes, can be more advantageously controlled by a hydrosulphite of sodium aldehyde or a sulfoxylate aldehyde.

STABILITY AND THE OPTIMUM CURE.

The views expressed by Dr. H. P. Stevens on the stability of vulcanized rubber and the "optimum" cure (THE INDIA RUBBER WORLD, October, 1916), are discussed adversely by Philip Schidrowitz and H. A. Goldsborough in "The India Rubber Journal" (October 28, 1916). They maintain the value and accuracy of their "correct" cure method of crude rubber valuation, as applied for technical purposes. With regard to "correct" or "optimum" cure in relation to aging, the authors state that the results of their experiments may be summarized as follows:

Standard mixture, 100 parts smoked rubber, 8 parts sulphur.

1. *Series stored over 15 months.* The samples most closely approximating to the "correct" cure showed less variation than the samples which were obviously under or over-cured, taking the "correct" cure tested 24 hours after vulcanizing as standard.

2. *Series stored over 8 months.* In three cases out of four a distinct improvement in "tensile product" was observed. None of the results indicate over-cure.

3. *Short period series.* Variation in the rest period between mixing and curing showed some, but relatively slight effect. The shorter the rest period, the slower the rate of cure.

Variation in the rest period between curing and testing exercises an appreciable effect on results during, approximately, the first 12 hours, but after that the alteration in properties is slow. The results are in keeping with practical experience on these points.

Investigation of the relation of combined sulphur to "correct" cure indicates that the former stands in no relation to mechanical properties.

"CORRECT" VS. "OPTIMUM" CURE.

The authors' original paper on the determination of "correct" cure will be found in "The Rubber Industry," 1914, page 214. In

brief their method is: (1) Vulcanization is physically and mechanically of a definitely progressive character. Its progress can be accurately expressed graphically by a series of stress-strain curves. (2) From the formula corresponding to the curves it is possible to select that curve, in a series, which represents an ideal balance of tensile properties. (3) The cure corresponding to such a curve is in fact the "perfect" or "correct" cure under given standard conditions of mixing, curing and testing. The method is scientific, admits of exact measurement, and is independent of any serious experimental error.

Eaton and Grantham's "optimum" cure is that cure which gives the highest figures for the "tensile product" (breaking strain and elongation at break). The method may yield erroneous results, mainly on account of the fact that on both sides of the "correct" cure, but particularly on the over-cured side, there is a region in which the "tensile product" may be equal to or greater than that of the "correct" cure. Since similar results may be obtained for a number of cures by this method, it may be impossible, in practice, to decide as to which cure, over a range perhaps of an hour or more, may actually represent the "optimum." The method gives no definite indication of the state of cure and is dependent on the uncertain character of the "break" and "elongation" figures.

RUBBER TESTING IN JAVA.

The Central Rubber Station for the Netherlands Indies, at Buitenzorg, Java, in charge of Dr. O. de Vries, is equipped for research and testing purposes, especially for the study of rubber preparation methods and testing samples for control and improvement of work on the estates. The Bulletin of the Station is distributed by application to the director.

Dr. de Vries in a lecture before the Malang Planters' Association, at Malang, discussed the preparation of plantation rubber and the need for research, considering the relative position of the two principal forms, smoked sheet and crêpe. Generally, smoked sheet has a quicker rate of cure than crêpe. The tensile strength of smoked sheet need not be below that of crêpe, and it is often found to be higher, due to not overworking the coagulum as in the case of making crêpe. Smoked sheet is inferior to crêpe in the matter of uniformity, due to the method of preparation. Crêpe in Java is generally prepared on older estates, with a long experience and well-regulated routine, whereas sheet making is often undertaken on estates just starting manufacture and, in consequence, the product is not so carefully controlled. The preparation of crêpe is practically a mechanical process while the preparation of sheet is still often complicated by the large number of small pans and much hand making. There are also irregularities in drying and smoking, so that the method of preparation affords much more chance for variation. There can be no doubt, however, that it is possible to produce sheets of very uniform quality.

The excessive rise in price of acetic acid has stimulated research with other coagulating material. Sulphuric acid has been tried and it has been found that slight variations in the amount used have an appreciable influence on the quality of the rubber, notably on its rate of cure. Sugar as a coagulant, according to some experts, is likely to cause much variation in the rate of cure, owing to bacterial action in the latex, dependent on the weather during tapping.

EXTRACTING DEAD HEEVA LEAVES

Negative results were obtained by J. C. G. Vriens in the extraction with benzene of the dead leaves which were still on the *Hevea* trees before the normal leaf fall. [Chemical Abstracts.]

WHALE OIL AS AN ACCELERATOR.

In referring to the suggested use, by Marill, of whale oil as a vulcanization accelerator, André Dubosc remarks in "Le Caoutchouc & la Gutta-Percha," that the crude oil containing sperma-

ceti is indicated, and adds that spermaceti contains a larger proportion of cholesters, organic alcohols which are found in the unsaponifiable caoutchouc resins and which play an important part in vulcanization by aiding the change of the sulphur to hydrosulphuric acid. As pure whale oil is composed largely of oleine, margarine, cetine and phocenine, it is changed, during vulcanization, partly, at least, into rubber substitute.

CHEMICAL PATENTS.

THE UNITED STATES.

SHOE BOTTOM-FILLER. A plastic spreadable mass consisting of a gelatinous, adhesive cement binder having a resinous component and containing coagulated oil in a fragmentary condition. When molded into a thin layer in a shoe-bottom it sets quickly, forming a permanent, waterproof and highly resilient cushion, strongly adhesive and cohesive in character, and yielding freely in all directions to pressure without disturbing its cohesiveness. [Andrew Thoma, Cambridge, Massachusetts, assignor to the North American Chemical Co., a corporation of Maine. United States Patent No. 1,203,435.]

SELF-HEALING COMPOSITION. A composition for the inner tubes of tires, comprising reclaimed rubber, pine tar and palm oil, the mixture having a dense semi-plastic, semi-elastic, tacky consistency free of pores and retaining these properties when heated in contact with rubber containing sulphur. [James P. Claire, Stratham, New Hampshire. United States patent No. 1,206,414.]

PROTECTIVE COATING. A composition consisting of liquid gutta-percha, 20 per cent; benzine, 15 per cent; ether, 25 per cent; rye flour, 20 per cent, and plumbago, 20 per cent. [Walter Schermerhorn, Omaha, Nebraska. United States patent No. 1,204,697.]

THE DOMINION OF CANADA.

WATERPROOFING COMPOSITION. A composition of grease, wax and rubber. [Joshua D. Trenaman, Hamilton, Ontario, Canada. Canadian patent No. 171,770.]

THE UNITED KINGDOM.

TREATMENT OF LATEX AND RAW OR SCRAP RUBBER. The removal of proteins and soft resins is effected by treatment, without heating, with mixed solvents, alcohols and any form of oil spirit, such as benzine or naphtha. The solvents may be applied as a vapor or spray in a specified apparatus. The precipitated rubber rises and is separated. The benzine which is absorbed by the rubber dissolves the soft resins and soluble proteins, but scarcely affects the hard resins and insoluble proteins which it is desired to retain. During the crepeing most of the dissolved resins and proteins are expressed. About 5 to 10 per cent of benzine remains in the rubber. [C. A. Hcken, British patent No. 8,487 (1915).]

SUBSTITUTES FOR EBONITE AND HORN. Treatment of yeast with formaldehyde or other aldehyde. As an example, 1,000 parts of yeast pulp containing 15 per cent of dry substance are mixed with an aqueous solution of 20 parts of blood albumen and coagulated by boiling. The precipitate is mixed with 175 parts of a 40 per cent solution of formaldehyde. The mixture is dried and mixed with 10 parts of powdered glue, to which may be added 75 parts of colophony and 8 parts of celluloid. The mixture is dried and molded at a temperature above 95 degrees C. and a pressure above 150 atmospheres. [H. Blucher, 31 Hardenberg strasse, Leipzig, and E. Krause, E. 6 Sedan strasse, Steglitz, near Berlin, Germany. British patent No. 11,563 (1915).]

GOLF BALLS. Gutta-percha, rubber or other material, with center or layers incorporated of a radioactive substance, such as pitch blend, etc. [E. Miller, E., 167 Oxford street, London. British patent No. 11,509 (1915).]

INDIA RUBBER. Latex is coagulated by treatment with the gases from the destructive distillation of wood after removal of the tar from the gases. [E. C. R. Marks, 57 Lincoln's Inn Fields, London. British patent No. 11,615 (1915).]

LABORATORY APPARATUS.

FREAS ELECTRIC OVENS—IMPROVED.

TWO new types of Freas electric ovens are now available. One is designed for drying a large number of samples simultaneously, or samples containing considerable moisture. It is provided with a flue in the back wall above which is placed a centrifugal fan driven by a motor supported on the outside of the oven. This arrangement provides forced circulation of heated air, and a forced withdrawal of moisture-laden air, thereby creating more perfect conditions and shortening the time required for drying. Another type is fitted with a cast aluminum perforated plate, which is revolved in the oven chamber by means of a motor. This arrangement subjects the various samples to be tested (which are placed on the revolving shelf) to the same constant temperature. [Eimer & Amend, New York City.]

FILTER PAPERS.

The short supply of German filter papers for analytical work has brought out a series of a dozen Whatman grades of this stock of English manufacture, which are taking the place of the well-known Schleicher and Schnell filter papers. All of the Whatman grades are guaranteed free of starch and chlorine and are put up in sealed boxes. [Eimer & Amend, New York City.]

TABLE TOPS.

A very practical top for laboratory tables that has been in use for the past five years at Dakota Wesleyan College, is described by H. I. Jones in the "Journal of Industrial and Engineering Chemistry." It consists of ordinary soft pine flooring on which are laid two sheets of tar paper, covered with large sheets of asbestos slate one-eighth inch in thickness. The asbestos is screwed on, the holes being countersunk and filled above the screw head with asbestos cement. Every year the table tops are treated with a gasolene solution of paraffin sufficiently concentrated to set to a jelly consistency when cold. The solution is brushed on hot. This paraffin treatment gives a polish but is really unnecessary and adds nothing to the serviceability. This style of top has the advantages of low first cost, long life, and ready application by anyone. It is so poor a conductor of heat that even thick glass containing hot liquids may be set upon it without breaking.

IMPROVED TEST TUBE AND FLASK BRUSH.

An improvement on the familiar sponge-end bristle test-tube cleaner is found in the "Dolbey," a patented brush of long fiber which fills and cleans thoroughly the inner surfaces of test-tubes and flasks. [Edward P. Dolbey & Co., Philadelphia, Pa.]

GOGGLES FOR FACTORY USE.

Rubber makers regularly engaged in buffing vulcanized rubber might profitably use the style of protective goggle described by J. R. de la Torre Bueno, of the General Chemical Co., in the "Journal of Industrial and Engineering Chemistry." His suggestion for the ideal goggle provides for, (1) perfect protection for the eye, (2) large field of vision, (3) comfort. The frame or mask should be of flexible wire netting with flexible edges bound with soft rubber tubing to conform to the facial contours. The glasses should be large and held in well-ventilated rubber settings to prevent condensation of moisture and clouding.

According to the military correspondent of the "Lokal Anzeiger," Berlin, Germany, the booty taken by General von Falkenhayn's forces at Crajova comprised oil, benzine and rubber in quantities that exceeded expectations.

New Machines and Appliances.

THE SCOTT AUTOGRAPHIC TESTING MACHINE.

THE natural advancement in the manufacture of textiles and mechanical rubber goods has required a more thorough knowledge of the materials used and of the effects of various processes through which these materials pass in the course of manufacture. Especially is this true in the manufacture of tires, as the success and life of a tire is by no means determined by its initial strength, but quite as much by its ability to retain its strength and resiliency.

The testing machine plays a very important part in determining the materials best suited for the desired results. In fact, the success that has been attained by manufacturers who have used the tensile strength tester intelligently has led them to further efforts along this line until the manufacturer of the testing machine has been called upon to produce a tester that will meet the most exacting requirements.

The accompanying cut shows one of the latest models that will automatically test rubber, tire fabric or other materials and write the result upon a standard letter-head. It will make tensile, elasticity, friction and other types of tests in general use.

It is mounted upon two heavy iron rail frames and is designed to be fastened to the wall in a vertical position. It can be

driven by an electric motor insuring constant speed and uniform results. The draw bar, or stretching screw, is of special high-carbon steel $1\frac{1}{8}$ -inch diameter and has a movement of 48 inches. It is operated by a heavy bronze nut and passes through the gear box without revolving. The downward or stretching stroke is made by direct gearing, allowing no chance for slip or speed variation. An automatic reverse brings the moving clamp back at high speed.

The speed of stretch may be varied by a back gear arrangement to reduce from 20 to 2 inches per minute. This provides for "friction" tests on hose, belting packing, boot tops, etc.

The autographic charting device works automatically and may be used to chart both stretch and strength tests, and by pressing a button on the side of the recorder it will produce a magnified or enlarged chart of "friction" tests. All charts are developed on standard letter paper held flat by two rubber rollers. The line is drawn by red ink from a pen operating across the sheet as the platen moves downward in ratio with the movement of the stretching screw. Several tests may be recorded on the same sheet and comparisons made of various samples. The sheet can then be placed in a typewriter for further data or filed in the usual way.

Rubber and fabric clamps, as well as spools with cleats for holding cords, etc., are furnished and are quickly interchangeable. An elasticity measuring device is attached to the frame of the machine and the length of stroke and distance between clamps may be varied by adjustment collars on the vertical con-

trol rod. When once set the machine will automatically stop and reverse at the same position with every test.

The recording head is simply but strongly built and has no delicate parts to get out of order. Its accuracy may be proven at any time without the use of special mechanism. The dial is of white celluloid with black figures and can be easily kept clean. The pointer indicates the maximum pull required to break the sample and remains in this position until reset by the operator. This is accomplished by means of a novel device requiring very little effort. [Henry L. Scott & Co., Providence, Rhode Island.]

THE SQUIRES BATHING CAP MACHINE.

That bathing caps are becoming more popular each season is demonstrated by the increasing demand for them. In an article on bathing cap machines that appeared in *THE INDIA RUBBER WORLD*, April 1, 1916, was shown a sketch of a machine for plaiting and forming bathing caps.

The accompanying illustration was made from a recent photograph of this machine, set up and ready for use. The operation, briefly stated, is as follows: The cap body is laid on the horizontal folding blades, the head band placed around the vertical head block and the ends joined, making the band endless. The head block is then lowered and the foot treadle depressed to lower the hollow plunger and force the horizontal plating blades upward, thus forming the plaits which are at the same time attached to the head band.

The treadle is then released, allowing the horizontal

blades to resume their original position. The cap now being folded over the blades of the vertical head block, a ring, to which the blades are attached, is moved to the right, which folds the plaits one upon the other. After attaching this outside head band and trimming, the cap is then removed from the machine. It is claimed that an operator of ordinary intelligence can make one complete bathing cap a minute on this machine. [The S. & W. Rubber Manufacturing Corporation, College Point, New York.]

THE FAWCUS FLEXIBLE COUPLING.

The unusual strains and sudden shocks to which rubber mill lines are subjected, frequently result in broken gearings, fractured shafts and damaged bearings. For that reason a flexible coupling that will absorb shocks and permit a certain amount of shaft misalignment is considered a necessary part of the mill room equipment. The pinion shaft of a double helical gear drive should, moreover, be connected to the driving shaft by a

balanced flexible coupling that will allow an adequate amount of free axial movement between the two parts of the coupling.

The illustration shows the Fawcus coupling that is designed to meet the particular requirements of rubber mills and mill drives.

It consists of two flanged castings machined all over, one carrying steel pins and the other having rubber-bushed holes into which the pins slide freely. The bushings are made of pure compound and bushed with brass.

These couplings are made of cast iron or steel, in ten sizes, constructed to transmit with safety the required horse-power. [Fawcus Machine Co., Pittsburgh, Pennsylvania.]

THE LUMMUS CAUSTIC SODA DISSOLVER.

Most concerns interested in recovering rubber by the alkali process continue to dissolve caustic soda in the old-fashioned way, despite all the disagreeable inconveniences and dangerous work of breaking up the cakes, handling and stirring them in some suitable receptacle to which steam is piped for heating water. Not only can these troublesome operations be avoided, but practically the entire cost of making the stock solutions of caustic soda may be eliminated by the use of the automatic caustic soda dissolver, illustrated herewith. This was devised by the superintendent of a chemical works who appreciated the fact that his men were often laid off for a day or so because of caustic soda burns.

This dissolver operates without steam for heating the water or power for stirring. Solution is effected by taking advantage of certain properties of solutes, accomplishing the desired result more quickly than is

possible even with the use of hot water in the old method. The operation of the dissolver is exceedingly simple. The thin iron drums are stripped from one or more cakes of the fused caustic, which are then rolled without breaking on the grid of the hopper. The dissolver is then filled with cold water to within a few inches of the curb and the safety doors are inclined against the cakes so that they

will close as the cakes melt down. The balance of the operation proceeds automatically, without further attention. The strength of solution can be controlled by a device in connection with the circulating system which may also be adjusted to suit individual requirements. This device has been on the Boston market for several years, but has not become generally known. It is claimed to be a money saver, and it gives the works manager assurance that the stock solution will be ready at a regular time each day. [The Walter E. Lummus Co., Boston, Massachusetts.]

INNER TUBES MADE ON GLASS POLES AND WATER CURED.

In ordinary practice, an inner tube is built up by wrapping a sheet of rubber stock around a mandrel, which is then placed in a horizontal vulcanizer and cured in open steam. What is said to be an improvement on this method, in that it produces smoother tubes, consists in covering the mandrels with hard rubber and vulcanizing in hot water. A variation of this is the use of glass mandrels.

The hot-water process, while not a novelty, has advantages in the manufacture of certain goods, particularly inner tubes,

where a soft, smooth finish is desired. Moreover, water curing is a non-burning process.

According to the S. & W. method illustrated here, the stock is built up on glass poles and instead of the usual cloth wrapping, the tubes are covered with a seamless circular woven cotton jacket. The poles are then placed in a suitable tank mounted on a truck, which is rolled into an ordinary horizontal vulcanizer. The tank is filled with cold water, the vulcanizer head closed and live steam turned into the heater until the cure is completed.

THE BARCO FLEXIBLE JOINT.

Vulcanizing presses of the single or multiple platen types are all dependent upon swing joints or some type of universal connection in the steam supply line. Moreover, there are many

other rubber machines that are operated by compressed air or hydraulic pressure where flexible connections are necessary. A flexible joint that will permit movement of the adjacent parts and at the same time remain tight under steam or air or water pressure is interesting.

The joint here illustrated may be used wherever steam, air, oil, water, gasoline, and other liquids are to be conveyed through a flexible or movable connection. It is particularly appreciated in manufacturing operations where the service is severe and where interruption in the use of the machine through defective connections is a serious matter.

The joint consists of a ball set in a casing and surrounded by two non-metallic hard gaskets, which contact both with the ball and casing, and allow the ball to move in an angular or rotary movement, while the two gaskets are held in place by a locking nut. The whole construction is very simple and the great success of the joints is due to the application of the gaskets to the ball, and the material of which these gaskets are made.

The joints are made in a large variety of sizes and shapes and they can be applied to almost any condition arising in the manufacture of rubber goods. [Barco Brass & Joint Co., Chicago, Illinois.]

THE SQUIRES BUCKET-TYPE STEAM TRAP.

In conjunction with vulcanizing presses for mold work, the bucket-type steam trap is generally recommended. If the steam pressure is the same for each press, it will be possible to operate several presses on one trap of suitable size, but five presses operating at 80 pounds and five at 60 pounds, for instance, would require a separate trap for each group. Sometimes the trap valve is opened or closed to increase or decrease the circulation speed and in this instance an individual trap is preferable.

The accompanying illustration is a sectional view of a well-known type of the bucket steam trap. It has one inlet, two outlets and two blow-off connections. The pipe connections can be made on either side, whichever may be most convenient, leaving the other side plugged. After installing the trap there should be enough water in it to float the bucket, as the valve does not seat until the bucket is up. As soon as sufficient water enters the trap, the bucket, being buoyant, rises and closes the valve, which is attached to it by the valve stem. When condensation in the trap body has reached the high-water line the bucket fills and sinks, opening the valve which discharges the water in the bucket, leaving enough to insure a perfect water seal, together with the condensation in the trap body through the valve port to the outlet until it has reached the low-water line.

Much difficulty may be avoided by giving steam traps due attention; for instance, blow out the trap as often as the condition of the water makes it necessary. If the trap becomes clogged with mud, caused by the boilers priming, the plug on one of the blow-off connections may be removed and the settling chamber cleaned out with a rod, without disconnecting the piping. [The C. E. Squires Co., Cleveland, Ohio.]

MACHINERY PATENTS.

THE STEVENS BIAS CUTTER TAKE-UP.

THE inexpensive and tedious operation of removing strips of frictioned fabric from the bias cutter and placing them in "books" is entirely obviated by this machine. A traveling liner is provided upon which the strips fall, and which is wound up with them in a compact roll.

In the drawing, *A* represents a bias cutter of the ordinary type and *B* the take-up device. The liner roll *C* is mounted on a truck *D* that may be rolled out and a new liner roll replaced. From the

roll the liner passes up over an idle roller *E* and then under the cutter and over the table *F*. This table is long enough to accommodate several strips of fabric for inspection or measurement prior to being rolled up.

The wind-up machine comprises two standards, provided with vertical slots or guides for the journals of the take-up roller *G*.

Directly below the roller is a drum *H*, the surface of which is roughened and drives the take-up roller by contact. The drum is rotated intermittently by gearing and a pawl and ratchet wheel movement shown at *I* and actuated by rod *J*, attached to crank arm *K*, which is driven from the main shaft *L*. In operation, the bias strips as they are cut off fall on the liner strip and are carried to the rear of the machine where they are rolled up with the liner on the wind-up roller. [William C. Stevens, assignor to the Firestone Tire & Rubber Co.—both of Akron, Ohio. Canadian patent No. 169,455 (1916).]

MACHINE FOR MAKING STORAGE BATTERY JARS.

This machine makes seamless storage battery jars with reinforced corners from sheets of uncured rubber. The drawing is a vertical section through the center of the machine, which is

supported on suitable legs not shown. The bed *A* supports the four horizontally movable rams, only two of which, *B* and *C*, are shown. These are operated by compressed air with the exception of *B*, which is hand operated. The vertical ram *D*, also air operated, is supported with its cylinder by a yoke frame *E* that is bolted to the bed.

In operation, the sheets of stock which are cut to size and covered with thin sheets of tin, are applied to the mandrel *F*, which is placed on the tongue projecting from the hand-operated ram *B*. This is moved forward under the vertical ram where it is held in position by the air-operated locking pin *G*. The air valve is now operated, advancing the rear ram, then the two side rams and finally the upper ram, thereby molding the sheets of stock on the core and forming a jar without seams or joints.

The air valve is then reversed, which withdraws the locking pin and retracts the several rams, when the mandrel and jar

may be removed from the machine and placed in the vulcanizer. [Theodore A. Willard, Cleveland, Ohio. United States patent No. 1,207,673.]

ROLL ADJUSTMENT INDICATOR FOR MILLS.

Imperfect roll adjustment of washers, mixers and warming mills is very often the cause of trouble in the mill room. If the rolls are not parallel and spaced a definite distance apart, the result will be poor batching and often serious damage to the machine. The present invention provides a very simple means for preventing these difficulties. As shown in the drawing,

this consists of collars *A* mounted on each adjusting screw and formed of two halves detachably secured together by a screw *B*. The periphery of each collar is provided with spaced circular lines scored around the collar, that register with pointers *C*, attached to each mill frame. The rolls are first brought into contact with each other and the collars then adjusted longitudinally so that the outer faces *D* are flush with the ends of the pointers. The adjusting screws are then backed out sufficiently from the mill frames to provide the necessary space between the rolls. This movement causes the circular scale marks on the collars to become visible beyond the pointers and indicate the space between the rolls. [George E. Nettleton, assignor to The Hartford Rubber Works Co., both of Hartford, Connecticut. United States patent No. 1,206,894.]

STORAGE BATTERY JAR MOLDING MACHINE.

This machine is designed for making battery jars or similar articles by folding sheets of rubber stock around a suitable core. The drawing is a sectional detail through the center of the machine showing the principal parts. These are supported on the table *A* and comprise a front presser plate *B*; a core *C*; a rear presser plate *D*; two vertical folding rollers, one of which is shown at *E*; two side presser plates, one being shown at *F*; and a top presser plate *G*.

The operation is briefly as follows: A sheet of rubber *H*, having on one side a thin sheet of tin, is placed in the opening between the vertical folding rollers, while another sheet is placed on top of the core to form the bottom of the jar. The hand wheel *I* is then operated, moving the front plate and core forward between the rollers that fold the sheet around the sides of the core, which is forced against the back presser plate. The ends of the rubber sheet are folded around the front of the core by an alternate right and left movement of a hand lever controlling the transverse movement of the folding rollers. By

means of the hand wheel, the front and back presser plates, with the core and partly finished jar, are moved still further forward until directly under the top presser plate, when the movement is arrested by stop *J*. Foot levers, not shown, are now operated together with the cam lever *K* to force the front plate forward, the side plates inward and the top plate downward, thereby molding the jar. The core and jar are subsequently removed from the machine for vulcanizing. [William H. Weitling, College Point, New York, assignor to American Hard Rubber Co., New York City. United States patent No. 1,205,940.]

MACHINE FOR WRAPPING HOSE. Strips of frictioned fabric are spirally wrapped under tension around hose or similar articles without using a stiffening core or mandrel or distorting the article being wrapped. [Henry Z. Cobb, Winchester, Massachusetts, assignor to Revere Rubber Co., a corporation of Rhode Island. United States patent No. 1,204,342.]

INNER TUBE RAG WRAPPING MACHINE. This is really a double lathe with parallel centers. The pole and uncured tube are placed in the back lathe, and the pole with the spirally wound fabric strip is placed in the front lathe. The strip is spirally delivered from one pole to the other by revolving both poles in the same direction. After curing, the strip is unwound from one pole and wound up on the other in the same machine. [John A. Vey, assignor to Continental Rubber Works, both of Erie, Pennsylvania. United States patent No. 1,204,213.]

TIRE TREAD CEMENTING MACHINE. This applies a coating of cement to the buffed surfaces of tire casings prior to applying the tread bands. [John M. Hibner, assignor to Morgan & Wright, both of Detroit, Michigan. United States patent No. 1,205,203.]

YARN IMPREGNATING APPARATUS. This comprises a U-shaped solution tank in which the threads to be impregnated are immersed for a considerable period, the surplus liquid removed from the threads, which are then delivered to the twisting apparatus. [Walter R. Denman, assignor to The Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,206,420.]

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- 1,205,120. Machine for trimming the overflow from molded articles. F. L. Valpey, Swampscott, Mass.
- 1,205,599. Repeal vulcanizing device. F. E. Dempsey, New York City.
- 1,206,255. Electrical repair vulcanizer. E. E. Rose, Swissvale, assignor to Westinghouse Electric & Manufacturing Co., East Pittsburgh, both in Pennsylvania.
- 1,206,530. Strip forming machine for automobile tire treads. W. A. Gordon, Shelton, assignor to Birmingham Iron Foundry, Derby—both in Connecticut.
- 1,206,799. Vulcanizing apparatus for boots. H. E. East, Lawler, Iowa.
- 1,207,117. Vulcanizing device for tire casings. C. S. Wood, Chicago, Ill.
- 1,207,641. Tire chuck. C. P. Seeger, St. Louis, Mo.
- 1,208,184. Tire adjusting apparatus. F. D. Mayer, Chicago, Ill.

THE UNITED KINGDOM.

- 10,382 (1915). Latex coagulating apparatus. W. G. Lange, ten Houte 'de, 9 Kanardaan, Bandoeng, Java, Dutch East Indies, and C. Bosman, 16 Forastraat, Haarlem, Holland.
- 11,439 (1915). Winding fabrics. F. Iddon, Glen Maye, School Lane, Leyland, Lancashire.
- 11,601 (1915). Vulcanizing mold. W. J. Mellersh-Jackson, 28 Southampton Buildings, London.

THE FRENCH REPUBLIC.

- 480,814 (January 31, 1916). Improvements in processes and apparatus for covering metallic wires, insulated or otherwise, with fibers, textiles, to make electric conductors and for other industrial applications. Société Electro Cable.

PROCESS PATENTS.

ELASTIC FABRIC AND PROCESS FOR ITS MANUFACTURE. In manufacturing elastic fabrics for use in making suspenders, masks for protection against asphyxiating gas, etc., the rubber threads are dressed, that is, tightly enclosed in a sheath of fabric. This holds the rubber while it is stretched, in the course of manufacture, and prevents it from relaxing totally, the object being to give nerve to the rubber.

In the new process, however, the rubber threads are dressed at the same time the fabric is woven, thus saving the preliminary operation of dressing the rubber threads.

It consists in forming, with a textile thread, a small chain on a rubber thread, which constitutes the core of the chain. If the rubber thread is more or less stretched during this operation it will have more or less nerve and if several of the chains are disposed side by side, and connected by one or more weft threads, the result will be a fabric that is lengthwise elastic.

The little chain is shown in the drawing on the left and is made on a passementerie loom of the needle or chainette type. The rubber threads coming from a bobbin pass through holes placed equally distant from one another in a guide-bar in front of the loom. The bar is arranged above the needles and the rubber threads running through it are separated from one another by the distance or interval between two consecutive needles. The rubber threads are placed between each needle and the guide-bar and are animated with an even, to and fro movement, which is adjusted so that each rubber thread passes alternately after the formation of a link, to the right and to the left of the corresponding needle. The result is, the chain is formed around each rubber thread and the weft joining the chains to one another goes through each of the links of the little chain.

As each little chain is made up of three strands, the weft threads, passing through the chain, leave two strands on one side and one on the other side and, after shrinkage, the fabric would be unbalanced. To correct this, a weft thread is passed on each side of the rubber thread, single weft on the side where there are two strands, and double weft on the side on which the strands of the little chains are single.

Thus in the center drawing will be seen the face of the fabric with two strands and one warp, while the reverse side with single strands and double warp is shown on the right. [Louis Brun. French Patent No. 480,735 (1916).]

VENTILATED RUBBER GLOVE. Flutes or air passages are molded in the glove, extending along the backs of the fingers and thumb to points beyond the wrist. [John C. Gibson, Akron, Ohio. United States patent No. 1,206,102.]

OTHER PROCESS PATENTS.

THE UNITED STATES.

- 1,204,609. Dental rubber composition and art of manufacture. S. G. Suppler, East Orange, N. J., and C. J. R. Engstrom, Los Angeles, Calif.
1,204,816. Beltline composed of wire coils, non-metallic pins, and a rubber filler enclosing the coils and pins. E. Pattee, Santa Cruz, Calif.

- 1,204,976. Process for constructing endless belts and molds therefor. F. Hall, Newark, Ohio.
1,206,914. Process of manufacturing rubber boots. R. B. Price, New York City, assignor to Rubber Regenerating Co., Mishawaka, Ind.
1,206,920. Plastic composition comprising a mass of rubber and a multitude of short untwisted textile fibers. J. R. Sabford, Salisbury, Conn.
1,207,293. Process of fitting hard rubber jars to storage battery boxes. C. Hodge, Radnor, Pa.
1,207,294. Method of repairing tire casings of the clincher type. O. F. Hungerford, assignor of one-fourth to C. E. Crookston—both of Middleville, and three-fourths to B. M. Soule, Grand Rapids—both in Michigan.
1,207,372. Process of making rubber water bottles. M. B. Clarke, Canton, Ohio.
1,207,709. Fabric for tires. L. J. Campbell, Chicago, Ill.

THE UNITED KINGDOM.

- 11,229 (1915). Shoe soles. T. C. Redfern, Dawson and Springbank streets, Hyde, Cheshire.

MISCELLANEOUS PATENTS.

A SECTIONAL RIM. Briefly, this comprises an annular base rim with side flanges; two flange rings adapted to co-act with a clincher or straight-side tire; a movable wedge-shaped key piece held in place by a spring latch. [Ernest Hopkinson, East Orange, New Jersey. United States patent No. 1,204,019.]

INTERNAL TIRE PUMP. For maintaining tire pressure a block of soft vulcanized rubber with molded air chamber, air passages and valves is placed between the inner tube and casing, and cemented to the former. The depression of the tire casing and the resiliency of the rubber block jointly pump air into the tire. [Henry F. Molkenbur, St. Paul, Minnesota. United States patent No. 1,207,427.]

CONTAINERS FOR TIRE REPAIR MATERIALS.

Auto-repair kits have grown in popularity of late, as the majority of motorists do their own tire repairing; moreover, in the tool box of many cars will be found the little paper screw top can containing a blow-out patch, rubber cement and cold patches for emergency purposes.

Large quantities of these screw top paper cans and tubes are used by manufacturers of repair materials to contain cementless patches, frictioned and coated fabric, unvulcanized tread and tube stock, combination tube stock for inside use and vulcanized pure gum patching sheet for general purposes. Talc for dusting the inner surfaces of casings before inserting the tube, is usually

sold in these containers. They are made in many different sizes to hold combinations of standard supplies and containers for specially equipped tire repair kits are made to order. [The St. Louis Paper Can & Tube Co., St. Louis, Missouri.]

NO MOTOR ROADS IN AMERICA!

Explaining the enormous United States consumption of rubber, "Le Grand Livre Commercial et Industriel," November 5, 1916, says:

The enormous consumption of rubber in the United States amounts almost to two-thirds of the world's production. This is due to the great consumption of pneumatic tires in the United States. There, there are hardly any wagon roads. All is rail-ways and rivers. The roads are bad, and, frequently, are nothing more than trails. The wearing out of tires is, therefore, formidable. But what do the Americans care, if they can cover kilometers. On another hand, the cheap automobile has generalized the use of motor cars, hence, a number of automobiles that we don't know in our old Europe.

New Goods and Specialties.

STAMP PAD WITH MOLDED RUBBER BASE.

TO relieve the stress, and strain of modern business life rubber heels, rubber casters, and many other noise-eliminating and jar-reducing devices in rubber have long ago entered upon enduring popularity. A recent and welcome addition is the stamp pad with molded rubber base—solid, substantial and absolutely noiseless. The base of the one here

illustrated is of gray rubber, the straight-cut edges extending well beyond the ink pad and thoroughly protecting the furniture upon which it is placed. The cover is of the usual metal variety, painted in yellow with black lettering, and fastened

to the rubber projections at the back of the pad by a small revolving rod.

It is stated that the ink used in this pad is prepared from a new formula which gives non-blurring, quick-drying, perfect impressions. [The Superior Type Co., Chicago, Illinois.]

SWEET'S COLON BATH.

It is generally understood that a large majority of human ills originate in diseases of the colon, or large intestine, and that judicious internal bathing is a safer and more efficacious method of dealing with these troubles than by the use of drugs. The combination internal bath, fountain syringe and hot-water bottle here illustrated has, besides the usual rubber water bottle and tube, a portable hard rubber pad containing an oil chamber. It is claimed that this is the only internal bath on the market in which oil can be used. [Sweet's Colon Bath Co., Chicago, Illinois.]

ALL-WEATHER TREADS IN SOLES.

Now that rubber soles are used extensively by shoe manufacturers, the anti-skid proposition is being studied and many designs of both soles and heels are now shown with treads intended to prevent slipping as far as possible. The four soles illustrated here are among the latest. The two on the right show adaptations of the vacuum principle, while the upper one

on the left has a series of straight, somewhat diagonal ridges, which answer for this purpose. The lower one on the left is composed of two different compounds neatly joined together, allowing for greater wear where it is most needed. [Avon Sole Co., Avon, Massachusetts.]

THE "CAMP-MOBILE."

Ever since the coming of the automobile, camping accessories have grown in volume and variety, and for some time it has been no uncommon thing for motoring parties to carry with them complete camping outfits, affording a vacation freedom for the conventional house-dweller undreamt of in former years.

The "Camp-Mobile" here illustrated, which can be folded up into a compact closed trailer and attached to the rear of an automobile, contains the latest

improvements in camp comfort, convenience and utility. It will be seen that, unlike many tent arrangements for this purpose, it has a solid canopy deck in the top, made of hardwood frame slats. This is covered with heavy, rubber-coated material, affording a rigid and absolutely weatherproof overhead protection. The side covering is of double-filled khaki and closely woven waterproof duck, with screen ventilators. The wheels are of hickory, painted a dark green, with solid rubber tires. The body of the trailer is 3 feet 8 inches by 6 feet 8 inches, of

cabinet - made type, with hardwood sills, wrought iron braces, tongue and groove dust-proof floor. The equipment consists of two double spring beds 47 inches wide and two regular bed mattresses; a collapsible table, two-burner gasolene stove, two-compartment ice box, lockers and shelves, the net weight of the outfit being about 600 pounds.

By removing all camping equipment and attachments, the "Camp-Mobile" may be converted into a commercial trailer, with or without top. Thus its possession may prove a business asset as well as a recreation adjunct. [Cozy Camp & Auto Trailer Co., Indianapolis, Indiana.]

RUBBER-COATED ELASTIC FABRIC.

That elastic fabric cannot be kept indefinitely in stock without deterioration is a well-known fact, for which either the merchant or the buyer frequently has to suffer. This difficulty has been successfully met by a new process in which the usual elastic webbing is coated with rubber, as it were, sealing the fabric, rendering it impervious to the effects of the atmosphere, and consequently prolonging its usefulness. This rubber coating may be applied to all kinds and widths of elastic webbing and is therefore suitable for all the various articles in which webbing is utilized. It can be cleansed readily with a sponge, and it is claimed that if applied to webbing that has already lost its snap through rotting of the threads, this rubber coating will give it a new lease of life. [S. & W. Rubber Manufacturing Co., College Point, New York.]

"ALLINONE" COMBINATION HOT WATER AND ICE BAG.

In nearly every form of illness either hot or cold applications are beneficial, and by the prompt relief thus afforded many lives are saved while awaiting the physician's arrival. The rubber

bag shown herewith may be used to contain either ice or hot water and is said to have unusually satisfactory properties for both purposes, holding heat longer for the hot applications, and not perspiring, as do some, when used as an ice-bag. Also, the "Allinone" is claimed to be absolutely airtight, withstanding the most severe tests of continual sterilization, and being unaffected by steam under pressure, acids, benzene, alkali, saline solutions and other chemicals. It is extremely light in weight, yet durable, and so flexible that it will shape itself to any part of the body. [Simon Kaufman Co., Inc., Philadelphia, Pennsylvania.]

NORTH BRITISH PRODUCTS.

At first thought it would seem that rubber erasers offer slight opportunity for variety, but by the use of trade names, designs, and different colors and shapes, a diversity is obtained which

affords a large scope for sales. Many of these erasers are used by school children, to whom the rubber with a picture, or a name, or a pretty color especially appeals, but they are excellent for general use and there is a surprising number of adults who purchase more readily an article of any character with a distinctive mark of some sort.

The British flag and the words "British Empire" form the patriotic scheme of decoration for a pencil eraser in white rubber, shown herewith, which is designed for ordinary school and office use. The "Chick" brand has a velvety softness of texture and is especially adapted for cleaning large surfaces and for working on paper of delicate texture. The imprint also appeals to the juvenile purchaser, and this eraser is supplied in red, white and green. The well-known "Thistle" trade-mark of the manufacturer adorns the third eraser shown

in the illustration, which comes in an artistic shade of pale gray.

Then there are the "Peter Pan" erasers, in exceptionally attractive shades of brown and blue; the "Perfection," "Unity,"

"Atlas"; the "Draughtsman," a specially soft rubber for drawing office use; the "Racer," showing a horse's head; and the "Palette," with a design of an artist's palette and brushes, furnished in red and white, and particularly suitable for artists' use.

A popular raincoat made by the same company is also shown. This coat is built on severely simple lines that give a well-tailored effect. [The North British Rubber Co., Limited, Edinburgh, Scotland.]

WIND-SHIELD CURTAIN FOR FORD CARS.

A simple accessory which adds considerably to the comfort of automobile driving is shown in this combined wind-shield and top curtain for Ford cars. It is made of heavy, rubber-coated auto-cloth and consists of a curtain which closes the space between the wind-shield proper and the top of the car, affording complete protection from wind and storms. This curtain is arranged to fasten along the front edge of the top and is very easy to attach. [Nathan Novelty Manufacturing Co., New York City.]

**"KLINGERIT" TYPE COMPRESSED ASBESTOS SHEET PACKING.**

After the European war was declared, the great American demand for this product, manufactured exclusively in Germany, Austria and England, could no longer be met. Imports ceased and the supply in this country was soon exhausted. Appreciating the opportunity thus afforded, a Connecticut firm manufacturing similar goods began to experiment along this line and is now producing at the rate of 1,000,000 pounds yearly, a compressed asbestos sheet packing that meets every service requirement and stands up under the most rigid tests. [Royal Equipment Co., Bridgeport, Connecticut.]

"BUCKLE-ON" BLOW-OUT PATCH.

For remedying tire blow-outs, there are patches and patches. Many combine the virtue of durability with the objectionable feature of a thickness which causes an unpleasant bump at every revolution of the tire. It is claimed that in the blow-out patch here illustrated, exceptionally strong, tightly-woven fabric and tough tread rubber take the place of inconvenient thickness and

maintain the smooth riding qualities of the unpatched tire. Also, it cannot creep and expose the hole intended to be covered because the buckle straps which fasten it on are wrapped around the spokes of the wheel and hold the patch firmly. This handy accessory is supplied in 3-3½, 4-4½ and 5-5½-inch sizes, so that one patch fits two sizes of tires. [The Goodyear Tire & Rubber Co., Akron, Ohio.]

BRITISH MOTORCYCLE BELTS.

RUBBER V-shaped motorcycle belts, now almost entirely unknown in America, are very popular in Europe, especially in Great Britain, where they are used, almost to the exclusion of all other mediums of power transmission, on two-wheeled motor vehicles. The reason advanced by those conversant with the subject is that American motorcycle manufacturers do not

appreciate the real advantages of this flexible and efficient drive.

Early American motorcycles were provided with belts of both the flat and V-shaped types. When flat belts were used, it was almost impossible, owing to limited space, to fit belts of sufficient width for transmitting the power from the engine to the rear wheel without considerable slipping, which caused the belt to wear out rapidly.

THE NORTH BRITISH CLINCHER FLEXIS BELT.

Trapezoidal, or V-shaped belts, were but little more successful because, in all cases, either the driving pulley or the belt used was too small for the horse power to be transmitted. Both flat and V-shaped belts gave way to chain drive before their use was sufficiently well understood to demonstrate their value for motorcycle power transmission, and the feeling is still strong among many American motorcycle men that they are not practical for our heavy, high-powered machines.

In Europe, correct designing has perpetuated rubber motorcycle belts, which are claimed to be

more flexible, easier on the machine, tires and rider, and just as efficient under usual conditions as chain transmission.

Here are some well-designed types of belts made in Great Britain of rubber and canvas and embodying important features. In these every factor in running conditions appears to have been studied closely by practical motorcyclists as well as engineers. The grooves absorb the natural displacement of rubber when the

THE WOOD-MILNE BELT.

belt is bent to negotiate the small driving pulley. Without these grooves the belt, when so bent, would widen at its base so that the top half would be forced away from perfect contact with the pulley.

The fabric of motorcycle belts must be of the best quality of cotton, proofed with rubber and embedded in a tough and wear-resisting rubber compound. Belts must be designed and constructed to insure a minimum of stretch.

THE AVON WATER-SHED BELT.

It is claimed that the belts here shown, when properly adjusted and proportioned to the power to be transmitted, will keep their adjustment, will not slip in wet weather and will give

efficient service for more than 10,000 miles on rough roads.

High-power motorcycles are still much in favor here in America, but, thanks to improvements in clutches and gear-sets, economical, light, low-power machines are rapidly being appreciated. Hence more study and investigation should be given to the qualities of rubber transmission belts for the latter type of motorcycles.

CLOSET-SEAT BUMPERS.

Rubber bumpers to be fastened to the under surface of water-closet seats have been used in various forms and designs for many years. The style shown here is one of several patterns made with nickeled escutcheon plates. In 1908 The Elastic Tip Co., Boston, Massachusetts, prepared molds to make a tip similar to this in style, but to be held in place by two screws, at the extreme ends, put through countersunk holes in the rubber. In May, 1909, Charles Pfau, of Cincinnati, Ohio, applied for a patent for a bumper substantially like this. The application was rejected several times, but one with some modifications was al-

lowed in February, 1915. As The Elastic Tip Co.'s molds were made the same month as the original application, namely, May, 1909, they could not antedate that application sufficiently to invalidate the patent.

Immediately upon the issuing of the patent Mr. Pfau organized the Long Seat Bumper Co., a holding company, which made arrangements with the Mechanical Rubber Co., of Cleveland, Ohio, to manufacture these bumpers and place them on the market. Notices were sent to the trade announcing the patent, together with warnings that suits would be brought if rubber manufacturers continued to make and sell such bumpers. It is said that in one or two instances suit has been invited.

Because there appeared to be only a comparatively small sale for such a bumper as that patented by Mr. Pfau, The Elastic Tip Co. decided to put out a line of various shapes, with metal escutcheons, this method of fastening differing from that employed in the Pfau patent. These are made with various lengths of bumpers, some having flat faces, like the one illustrated, while others have convex or semi-cylindrical faces, and on these there is a moderate, steady demand from hardware and plumbers' supply dealers.

GEO. S. COLTON ELASTIC WEB CO.

The Geo. S. Colton Elastic Web Co., Easthampton, Massachusetts, has increased its capital stock from \$250,000 to \$350,000 by the addition of \$100,000 preferred stock, \$50,000 of which has been sold to increase the working capital, the balance to be held for sale as the business may require.

George S. Colton is no longer connected with the company, his entire stock holdings having been purchased by C. A. Richmond, who has resigned as treasurer of the Glendale Elastic Fabrics Co. to assume active management of the Colton company. In order to correct current rumors, it is announced that neither this company nor Mr. Richmond has any connection with any other company in a similar line.

RUBBER MAN INSURED FOR \$1,800,000.

Harry Thatcher Dunn, Toledo, Ohio, president of The Fisk Rubber Co., and vice-president of the Willys-Overland Co., is now counted among the largest life insurance policy holders, his total of \$1,800,000 being exceeded by only three or four other American business men. To take up this amount, several insur-

The Editor's Book Table.

PLANTATION RUBBER SECTION, TRADE SUPPLEMENT, "THE Times," London, England, December, 1916. [30 pages with maps of the rubber growing areas.]

WITH England controlling the growth and supply of plantation rubber, which now far exceeds the production of all other varieties, American manufacturers of rubber goods must look toward London for authentic information regarding this great British industry, and "The Times" has supplied a comprehensive summary, consisting of many signed articles by world-famous experts, covering virtually the whole field of rubber supply, manufacture and finance. That a copy for reference will prove invaluable to every consumer of crude rubber may be seen upon examination of the principal features of the table of contents reprinted below.

Rubber and War. Sir Frank Swettenham, K.C.M.G.
History of Plantation Rubber. Gilbert R. Redgrave.
The World's Rubber Position. W. H. Rickinson
Experimental Cultivation. Samuel Rideal, D.Sc., F.C.S.
Diseases and Pests. J. Mitchell, A.R.C., Sc.
Scientific Assistance. J. Bretland Farmer, F.R.S.
Some Present Needs. Wyndham Dunston, C.M.G., F.R.S.
Influence of Exhibitions. Sir Henry Blake, G.C.M.G.
Rubber, a National Asset. E. Stevenson.
The Rubber Growers' Association. C. Emerson.

Many other signed articles review planting in British dominions and abroad; getting rubber to market; rubber and finance; and rubber in industry, including vulcanization, testing, factory control, footwear, rubber heels, tires and synthetic rubber.

As to future supply, the constantly increasing demand of the American tire industry is recognized as a vital matter to be reckoned with. For six years past the annual consumption of the United States has averaged to increase 25 per cent, until it now totals more than half the world's entire production. Should this continue for five years, W. H. Rickinson expresses the belief that within that time the supply of crude rubber would become insufficient to meet the demand; that as far as can be judged at the present time, as 1907 was to 1910, so in all probability the position in 1918 will be to that of 1921.

ELEMENTS OF INDUSTRIAL CHEMISTRY. By Allen Rogers, D. Van Nostrand Co., New York City. [8vo, illustrated, 513 pages, cloth. Price \$3.]

This is an abridgment covering the salient points of the author's more comprehensive "Manual of Industrial Chemistry," the subjects being treated in a general manner only. As much detail as possible has been eliminated that the fundamental principles might be more clearly set forth. While the range of subject is not as broad as that of the larger volume, it is still sufficient to give the student a very comprehensive view of the entire field, and so fills a definite need. Rubber men will be particularly interested in the chapter on resins, oleo-resins and gum-resins, including india rubber. Of the other 26 chapters, those of particular value to the rubber trade include: Coal Tar and its Distillation Products, The Petroleum Industry, Essential Oils, Textiles, Water and its Purification, and Pigments, some of which are used as rubber compounding ingredients.

TROPICAL AGRICULTURE. BY FARLEY VERNON WILCOX, OF the United States Department of Agriculture. D. Appleton & Co., New York City. [8vo, 373 pages, illustrated. Price, cloth, \$2.50.]

Written primarily for the business man and agricultural student, this book tells what everybody ought to know about the tropics. It deals with agriculture in the commercial sense, and describes the nature, source and production of about 350 tropical commodities to eat, wear, and use in technical industries. Particular attention is given to the presentation of an intimate picture of animal industry, soils, climate and economic conditions.

A concise but comprehensive chapter has been devoted to rubber, in which gutta percha, balata, jelutong, chicle, camphor and other gums and resins are dealt with. The young man who contemplates locating in South or Central America will find particular interest in those chapters devoted to the tropical climate and its effects on man, farm animals and crops; the importance of tropical products and commerce; economic and social conditions and opportunities in the tropics; agricultural methods peculiar to the tropics and tropical soils.

COTTON FACTS. BY CARL GELLER. SHEPPERSON PUBLISHING CO., New York City. [16 mo., 240 pages, cloth. Price \$1.]

This statistical review has justly become the cotton man's ready reference work of the English-speaking world. In the present forty-first annual edition the material gathered for so many years by the late Alfred B. Shepperson has been brought up to date by Carl Geller and represents a remarkably comprehensive compilation of official and reliable data. Whether the information required relate to crops, receipts, exports, stocks, home and foreign consumption, visible supply, prices, acreage, or mills, in the United States or abroad, the index will disclose it quickly. Special features of this edition include the details of production of long-staple cotton in the United States; statistics of cotton in Great Britain since 1801; cotton yield in the United States by states and per acre from 1900 to 1915; and a table of important fluctuations of the January and July options on the New York Cotton Exchange from 1911 to 1916.

ADVERTISING BY MOTION PICTURES. BY ERNEST A. DENSCH. The Standard Publishing Co., Cincinnati, Ohio. [8vo, 255 pages, cloth. Price \$1.50.]

With the entire country under the spell of the motion picture it is not surprising that advertising agents have appreciated its mighty powers in direct as well as indirect publicity. The mission of the present book, therefore, is to set forth the possibilities of this latest medium for entering foreign and developing home markets; for introducing new and increasing the demand for older goods; for familiarizing the public with trade names, production sources and methods, and even facilitating direct salesmanship. Notable instances of the application of motion pictures in several lines of business are recounted, and many suggestions given for the preparation and display of films, together with other details making for the success of such a venture.

SPANISH-AMERICAN DIRECTORY AND BUYERS' GUIDE IN THE United States. Export Trade Directory Co., Inc., New York City. [Quarto, 570 pages. Price, paper covers, \$4; cloth covers, \$5.]

A very extended list of all manufacturers and dealers in the United States who are interested in foreign trade is provided by this large and important work intended for the use of business men in Spanish-American and Portuguese-American countries. The directory portion proper is very extensive, each heading being given in Spanish, Portuguese, French and English, while in the front of the book are indices in each of the four languages referring to the pages on which are to be found lists in the various trades. A portion of the book is divided into four sections, each section being of a different color paper and having an index in the corresponding language. Upon looking up an article in any one of the above-mentioned languages, its equivalent name is found in the other three. The book contains a vocabulary in these four languages of phrases necessary to the traveler, together with many technical terms frequently used in business correspondence. Tariffs for telegrams, money exchange and other data are tabulated. The various Latin-American countries are described from a commercial standpoint with hand-

some illustrations, and a great amount of information regarding the United States and especially New York City is included.

ANNUAL REPORT OF THE SECRETARY OF THE NAVY FOR THE fiscal year 1916. Published by the Government Printing Office, Washington, D. C. [Paper, 8vo, 143 pages.]

The navy, our first line of defense, is of interest to every business man, and according to this report the fiscal year ending June 30, 1916, has marked the largest expansion in times of peace, while the three-year building program covering a total of 813,000 tons, stands out beyond all precedent in the history of the United States. The year has seen marked advances in efficiency in many directions, but business men will find particular interest in the industrial activities of the shore stations and navy yards, and the growing tendency of the government to reclaim its own waste material and to manufacture many of its essential supplies as a matter of economy. The Navy Department is also going a step farther and interesting itself in conservation of natural resources, such as petroleum in naval reserve lands, and the encouragement of growing staples, such as cotton in Guam.

Rubberized fabric manufacturers will look with favor upon the increased attention being given to aircraft for sea service and the recommendation of the General Board that \$6,000,000 be appropriated in the 1918 program for naval aeronautics.

Full recognition of the importance of chemistry and every branch of engineering in national defense is seen in the activities of the Naval Consulting Board, which is cataloging our industrial resources, among which rubber manufacture ranks high, and bringing the minds of our greatest scientists to the solution of many big problems for the common good. These investigations promise to develop advances no less monumental than those in wireless telephony.

ANNUAL REPORT OF THE PAYMASTER GENERAL OF THE NAVY for the fiscal year 1916. Published by the Government Printing Office, Washington, D. C. [Paper, 8vo, 318 pages.]

Supplementing the report of the Secretary of the Navy, this shows that improved business methods, particularly in the purchase of supplies, have increased the purchasing power of every dollar to the maximum and effected a concrete saving of \$2,149,933, the total expenditures for the year being \$152,821,540.67. Manufacturers of rubber goods will be interested in the statement that of the \$207,672,299.82 property investment of the stores of the navy, \$473,288.07 is listed as insulated cable and wire, and \$326,854.54 as rubber packing, gaskets, etc.

CANADIAN TRADE INDEX. CANADIAN MANUFACTURERS' ASSOCIATION, Inc., Toronto, Canada. [Large octavo, 560 pages, cloth. Price, \$5.]

This book seems to supply a very full and comprehensive directory of the manufactures of Canada. The alphabetical list of articles occupies about 350 pages. This is followed by about 50 pages, giving an index, arranged alphabetically in French, of the headings in the main portion of the directory, thus rendering it valuable to that large class of people in Canada who use French preferably to the English language. There is also a complete alphabetical list of Canadian manufacturers, giving not only the main offices but the addresses of their factories. These two latter lists are printed on blue paper, one at the back and the other at the front of the book, thus enabling the user to turn at once to the desired section. A considerable amount of valuable mercantile information regarding the Dominion is also given.

STATISTICS OF MANUFACTURES, COMMONWEALTH OF MASSACHUSETTS. Twenty-ninth Annual Report, Bureau of Statistics, Boston, Massachusetts. [Paper, 8vo, 114 pages.]

According to this latest official source of information, the manufacture of boots and shoes continues to lead that of cotton goods as the greatest industry of Massachusetts, greatly exceeding in value the similar product of any other State and almost equaling the sum of New York, Missouri, New Hampshire, Ohio and

Pennsylvania, the other principal shoe producing States. The total value of the product of all industries in Massachusetts is given as \$1,641,373,047, of which \$255,188,013 represent boots and shoes, cut stock and findings. To this may be added rubber footwear to the value of \$23,788,788 manufactured by 8,087 wage earners in nine factories representing an investment of \$23,027,061. Woven belting and hose to the value of \$942,180, were produced by 183 operatives in six plants having an invested capital of \$906,033. Miscellaneous rubber goods amounted to \$23,011,349 and were the product of 4,743 wage-earners in 42 factories representing an investment of \$17,345,185. This includes automobile tires, which, unfortunately, are not given separately, although the total industry of the State is large.

NEW TRADE PUBLICATIONS.

Any of the following publications will be supplied by those issuing them, upon request.

The Osborn Manufacturing Co., Cleveland, Ohio, sends out a handsome, self-binding catalog so arranged that it can be kept up to date by mailing fresh pages to replace others in case of changes in styles or prices. The catalog numbers more than 300 pages, and contains well-arranged lists, voluminously illustrated, of the various lines of manufacture, including brushes and brooms, hardware specialties, foundry supplies, etc.

Among the various articles which are largely used by tire and rubber manufacturers, are hand wire scratch brushes, which are employed to take the place of sand paper, steel wool and other abrasives, and which, it is claimed, enable the user to do quicker and better work. These are made in various shapes and styles for many purposes. There is also a large line of rotary wire buffing brushes, as well as other lines of brushes and dusters especially suited for rubber mills, among which the company has a large trade.

* * *

"A Chain of Evidence" is the appropriate title of a handsome 20-page pamphlet issued by the Morse Chain Co., Ithaca, New York, to show the construction and many uses of the Morse silent chain for small power drives. Many large half-tones illustrate its application to pumps, mixers, rolling mills, ventilating fans, textile spinning frames and many other machines.

* * *

Two large and handsome wholesale catalogs for the 1917 season have just been issued by the Dunlop Rubber Co., Limited, Aston Cross, Birmingham, England. One is devoted to motor tires, wheels, rims and sundries, and features the Dunlop Plain, Grooved, Steel-studded, Rubber-studded, Combination Rubber and Steel-studded Tires, together with the Dunlop Detachable Wire Wheel, Twin Wire Wheel, and Steel Wheel. The other catalog contains only bicycle and motorcycle tires, rims and sundries. The bicycle line is exceptionally varied, and includes the Dunlop Magnum Roadster, Juvenile, Road Racing, Carrier, Tubular Sprint and Path Racing Tires; Warwick Roadster, Juvenile Speed Carrier, and Heavy Carrier Tires; the Cambridge Roadster and Juvenile, the Edinburgh Roadster, and Pericles. Each tire has an inner tube of corresponding brand. For motorcycles there are the Ribbed, also the Rubber-studded Motorcycle tires, the Rubber-studded, Three-ribbed, Combination and Side Car Motorcycle tires, all with beaded edge; and the Ribbed Racing and Rubber-studded, both wired on. Butt-ended tubes are recommended for these. An accompanying circular describes the Dunlop golf balls.

* * *

Editorially, and in an article on electric drive and safety controls in rubber mills, elsewhere in this issue, the increasing importance of electricity and electrical devices in the manufacture of rubber goods has been emphasized. Thus the 1916 Electrical Supply Year Book, published by the Western Electric Co., Incorporated, New York City, will be of value to every factory

superintendent and electrician. Including as it does the seemingly infinite number and variety of devices and equipment manufactured by this great and rapidly growing firm, this 1,500-page large octavo volume, bound in boards, is at once a descriptive catalog and a price-list. Rubber parts are conspicuous in the construction of much electrical equipment and, as shown by the index, electricians find frequent use for such rubber goods as boots, casings, gloves, matting, rings, rods, sheets, tubing, vulcanizing rubber and cements.

* * *

The Lenz Apparatus Co., New York City, formerly Lenz & Naumann, Inc., has issued a large, well-illustrated, cloth-bound catalog of general laboratory apparatus and supplies that merits a place in the reference library of every industrial chemist. Its 499 pages include virtually everything in laboratory equipment and the work is prefaced by 15 pages of general chemical information, chiefly tabular matter. Over 6,000 articles are listed, most of them being illustrated and bearing serial numbers for ready reference to the description and price.

* * *

A special catalog and price list of hose has been issued by the Peerless Rubber Manufacturing Co., New York City, manufacturer of mechanical rubber goods for all purposes. Profusely illustrated, artistically arranged and well printed, its 48 pages emphasize the highly specialized business hose manufacture has become, with many sizes, weights and types of construction for varied needs. Several fabric and wire as well as rubber coverings are shown as well as metal-lined suction hose. The line also includes couplings, nozzles and rubber tubing.

HOLIDAY GREETINGS.

THE arrival of many attractive and useful articles of infinite variety from friends desirous to express kindly remembrance renews the spirit of the holiday season and reminds us agreeably of the arrival of the year 1917. For these holiday greetings which are enumerated below we express our sincere thanks, and take this opportunity to wish the rubber trade collectively and individually a prosperous New Year. And may this coming twelvemonth see the establishment of a lasting concord among the nations which will permanently insure the brotherhood of man.

SOUVENIRS AND NOVELTIES.

George F. Lufbury, Jr., manufacturer of chemicals, Elizabeth, New Jersey, has sent another of his unique calendars so valuable for reference in every office. Each sheet carries three months, the current month being centrally located in bold face type, and the previous and coming month being respectively above and below in outline type.

John Royle & Sons, Paterson, New Jersey, are distributing their ever-welcome leather-bound, vest-pocket diary with the usual tabular matter and memorandum pages in addition to the daily spaces. Motorists will welcome the tire mileage record page, and with foreign affairs uppermost in every mind it was a happy thought to insert the many colored maps of the world.

CARDS AND CALENDARS.

J. W. Coulston & Co., importers and manufacturers of dry paints and colors, New York City.

J. H. Day Co., rubber mixers, Cincinnati, Ohio.

Edward B. Fulper, importer and manufacturer of minerals, acids and chemicals, Trenton, New Jersey.

Holmes Bros., rubber molds and special machinery, Chicago, Illinois.

L. J. Mutty Co., rubber cloths and tubing, Boston, Massachusetts.

New Jersey Rubber Co., dealer in all kinds of reclaimed rubber, Lambertville, New Jersey.

J. H. Stedman Co., scrap rubber merchants, South Braintree, Massachusetts.

E. M. & F. Waldo, colors for rubber compounding, New York City.

Charles E. Wood, broker in crude rubber, balata, gutta percha and kindred products, New York City.

Davol Rubber Co., manufacturer of druggists', surgeons', dentists' and stationers' sundries, Providence, Rhode Island.

Monatiquot Rubber Works Co., reclaimer of waste rubber, South Braintree, Massachusetts.

RUBBER FOOTWEAR PRICES.

AS has been the custom for many years (with a single exception), the manufacturers of rubber footwear will announce their prices, terms and discounts for the coming year on January 1. The plan usually is to time the mailing of the information so it will reach the wholesalers simultaneously in every part of the country. The manufacturers are unwilling to give out any information regarding this matter in advance, and THE INDIA RUBBER WORLD is unable, therefore, to print any official news on this subject in this issue.

There is no doubt, however, that prices will be materially advanced. Those in effect up to December 31, 1916, were practically the same as those made March 1, 1915, though the price lists of January 1, 1916, showed advances of five cents or less.

The rubber boot and shoe situation at the present time is peculiar. This business is dependent almost entirely on climatic conditions. If the winter be mild, retail and wholesale dealers will generally carry over sizable stocks to the following season. Should there be considerable snowfall, naturally the stocks will be sold out. When there are several early snow storms, the chances are for a much heavier consumption of footwear during the season, for people who start wearing rubbers early, are likely to need a second pair before the winter is over.

Last winter was a mild one, and in February or March, stocks of rubbers were large, but late severe storms so affected the trade that stocks were depleted, and almost no rubbers were carried over. This resulted in the placing of heavier advance orders than usual, and many of the manufacturers found their factory capacity sold very early in the summer. The demand for help in the munition factories resulted in a drain on the working forces in the rubber factories, and secondarily in labor troubles. The consequence has been that the manufacturers, foreseeing that all orders could not be filled, adopted the plan of distributing their output proportionately. In this way most of the wholesalers have received 80 or 90 per cent. of their orders. By the terms of their contracts with some of the manufacturing companies, the unfilled portions of their orders are automatically cancelled at the conclusion of the contract period, namely December 31, unless specifically renewed at the new prices.

Regarding the 1917 price lists, there is this much to be said. Brazilian rubber prices are about 15 per cent higher than they were when the 1916 prices were made, while plantations are practically the same. But everything else entering into the manufacture has advanced, some as much as 100 or 200 per cent. Chemicals and compounding ingredients show such advances. Cotton fabrics are 50 to 60 per cent. higher, and labor costs 10 to 20 per cent. more. Taking these into consideration, the manufacturers would seem justified in making a material advance in their prices, and they will undoubtedly do so.

ICE BAGS RULED MANUFACTURES OF COTTON.

Judge Cooper, New York City, has sustained the Board of Appraisers in classifying ice bags of cotton and rubber, imported by Knauth, Nachod & Kuhne, as manufactures of cotton assessable at 30 per cent, the importers having claimed 15 per cent duty as manufactures of india rubber or gutta percha commonly known as druggists' sundries.

Interesting Letters from Our Readers.

BELGIAN EXPERT DEVISES CASTILLOA KNIFE.

TO THE EDITOR OF THE INDIA RUBBER WORLD

DEAR SIR—I write to call your attention to a colossal on page 45 some interesting particulars about rubber growing in Mexico. The letter signed "Planter" does not surprise me. Perhaps you will remember I have always maintained that the two rubber trees most difficult to handle are the *Castilloa* and *Funtumia*. Still, when worked judiciously, good results can be obtained. Perhaps you may recall that four to five years before the war I made some technical reports about *Castilloa* for two of the most important American companies growing rubber in Mexico. I have made a special study of the knife required for *Castilloa*, also the method of tapping and coagulating the latex. If I could be in Brussels I would send you samples of Mexican *Castilloa* coagulated by myself which compare favorably with the best plantation Para in Middle East.

Kindly send my card to "Planter" and advise him that I am prepared to make a full technical report dealing with the following items:

1. How and when to commence tapping.
2. My design for a suitable knife.
3. Spout and cups to be used.
4. How to coagulate and prevent sweating of *Castilloa* rubber.
5. The best shape for the rubber.
6. Methods of packing.

G. VAN DEN KERCKHOVE.

26 Stanhope Road, Highgate, London N., England, November 11, 1916.

THE BIGGEST OF ALL HEVEAS

TO THE EDITOR OF THE INDIA RUBBER WORLD

DEAR SIR—I write to call your attention to a colossal *Hevea*, probably the largest in the world. It is 127 feet in circumference at the base, and has a record of yielding for 120 days an average of 22 pounds of rubber a day. As you have of late been publishing notes on the world's largest rubber trees, I am pleased to be able to supply the actual facts regarding this tree.

It is situated at the Seringal Porvir on the River Acre in Brazilian territory at a considerable distance from the Bolivian frontier. This seringal is now the property of a friend of mine, Colonel Antonio Vieira de Souza. The tree is exploited by a whole family, father, mother, and several children, and its yield is about as stated. This family divides its time between cultivating the cereals necessary for food and the extraction of the rubber latex. This is not the only giant *Hevea* tree in that region. There are thousands of them, but this is the largest under exploitation. Just at this point the country is considerably higher than the whole surrounding lands, which leads to the conclusion that it was from the seed of these denizens of the forest that the *Hevea* found its way both east and south of Brazil, for native *Hevea* is found as far south as the seventeenth degree, and as far east as the south of Maranhão.

This tree must have been growing long before Columbus discovered America. No such thing as a rubber plantation exists in the upper Amazon, and the trees which have been planted here and there in the whole north of Brazil cannot properly be called plantations. The only practical attempt in this direction was made by me in lecturing on the subject at the Engineers' Club in Rio de Janeiro in 1912, by virtue of which the Brazilian Government promulgated laws offering prizes for the planting of rubber and establishing experimental stations throughout the

rubber region, especially at Piahy, Maranhão, Bahia and Pará; but just when this was about to be put into practice, financial difficulties arose, and since then the war has made impossible any attempt in that direction.

J. SIMAO DA COSTA.

Pará, December, 1916.

COTTON CROPS THREATENED.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I am spending the month of December studying the cotton situation in the southern States and I have noticed a point which I believe will interest you and the readers of THE INDIA RUBBER WORLD. The boll weevil which entered Texas at Brownsville in 1892 has advanced at the rate of about 65 miles per year and has now covered half of Florida. The Sea Island cotton is threatened today and entomologists believe that it will affect this cotton even worse than it affected the uplands or short staple cottons.

The estimated loss caused thus far by the boll weevil is one billion dollars. In Florida alone in 1915 the loss was approximately one million dollars. Sea Island cotton matures late and will therefore suffer markedly from the attack of the boll weevil. The supply of Sea Island will be cut short. It is small enough under ordinary conditions. On November 20 it sold in New Bedford, Massachusetts, at 52 cents per pound; if the yield per acre is cut down to one-third of the present, the price will become prohibitive.

Tire duck manufacturers will have to abandon Sea Island cotton. They will have to fall back on ordinary staple cottons and the strength of the fabric will have to be secured in some other way. Either the structure of the yarns and fabric must be changed, or the fabric must be given a chemical treatment to increase its strength.

This whole subject is of such far reaching importance that it cannot be given too much serious attention. It is, in my mind, worthy of immediate consideration by the tire manufacturers.

FREDERIC DANNERTH.

Atlanta, Georgia, December 6, 1916.

WATCHING THE ENEMY.

THAT our esteemed contemporary, "Le Caoutchouc & la Gutta-Percha," scans every line of THE INDIA RUBBER WORLD, and with the keenest sort of analysis, may be gathered from the following:

"Patent Literature" is always very interesting to read and in it one often meets interesting things.

Thus, going through the September issue of THE INDIA RUBBER WORLD, we see that Messrs. Max Theumann and Joseph Koestchet have sold to the Société Chimique des Usines du Rhône their American patent, No. 1,191,439, referring to the preparation of ethers of cellulose.

Would it be an indiscretion to inquire into the nationality of Messrs. Max Theumann and Joseph Koestchet, whose names sound strongly German?

We further see in this same "literature" that the Société Générale des Caoutchoucs de Térébenthine (General Turpentine Rubber Co.) has taken out a Canadian patent, No. 168,727, the object of which is to reclaim old rubber by means of tetrachlorethane. The process is, no doubt, the same as that patented last year by Count Charles de Villers.

COPY OF INDEX to "Rubber Machinery" will be sent free upon request.

The Obituary Record.

A VETERAN RUBBER IMPORTER.

HENRY A. GOULD, head of the Gould Commercial Co., Inc., 12 Bridge street, New York City, dealer in crude rubber and tires, and without doubt the dean of American crude rubber men, died December 25 in the Overlook Hospital, aged 73. He was a resident of Chatham, New Jersey.

Mr. Gould was born and lived many years in Boston, Massachusetts, attending the public schools there and receiving his mercantile education in the offices of P. & J. P. Hawes & Co., an East India house with which he remained for four years. At the age of 21 he became a partner in the East India brokerage firm of Robert Williams & Sons, Boston, established in 1834 and the leading brokers in East India products, especially rubber and gutta percha, having prominent connections in New York. Five years later he retired from the firm and spent a year traveling in the West, where he represented large financial interests in Duluth and Minnesota prior to the panic of 1873.

Deciding to remain in the Eastern financial centers, Mr. Gould opened an office in Boston on his own account for dealing in rubber, with Earle Brothers as a New York connection. Later the Gould Commercial Co. was organized in New York to import aniline dyestuffs and refine crude camphor, three of the five American camphor refineries being acquired by the company.

In 1897 the Boston business, conducted under the name of Henry A. Gould, and the New York business of the Gould Commercial Co. were consolidated as the Henry A. Gould Co., with headquarters in New York and a branch in Boston. It was decided to concentrate upon crude rubber, and branches were therefore opened in Trenton, New Jersey, Para and Manaos, Brazil, and later in London, England. Representatives were located in Mexico, Central and South America, and Africa, as a result of which many new grades were introduced to American trade, notably Pontianak.

The Henry A. Gould Co. was incorporated in New Jersey in 1902, and again in New York in 1905. The Gould Commercial Co., Inc., to which he was devoting himself at the time of his death, was a Delaware company incorporated in 1914. During Mr. Gould's varied career in many branches of the rubber industry, including import, export and manufacture, many young men have learned the business under the guidance of his broad experience, no less than ten of them having since become leading rubber merchants.

In 1902 Mr. Gould married Miss Edna F. Ellis, of Philadelphia, Pennsylvania, and it is said to have been largely through her influence that he had previously become treasurer and active superintendent of the New York Rescue Band, which maintained clubrooms, employment bureau, etc., on Fourteenth street, New York City.

A RUBBER COMPANY FOUNDER.

In the recent death of Henry Binns, Passaic, New Jersey, has lost the father of many important business enterprises and an inventor of note. Mr. Binns was an iron molder by trade, and although born in England and the inventor of a device for planing armor plate used in the British navy, also invented the first steam hammer used by the Krupps of Germany in building their 100-ton guns. In 1869 he came to America and was one of the founders of the Manhattan Rubber Co., Passaic, New Jersey, the Hobart Trust Co., the New Jersey Engineering & Supply Co. and the Guarantee Mortgage & Title Insurance Co.

Mr. Binns is survived by his wife, six children and nineteen grandchildren.

A NEW ENGLAND RUBBER CLUB PRESIDENT.

John Henry Flint, president of the Tyer Rubber Co., Andover, Massachusetts, died at his home in that town November 29, in the seventy-fifth year of his age. Mr. Flint was born in Andover, and after a public school education entered the market business, at the same time developing his real estate inter-

ests. He early became interested in the Tyer Rubber Co., and was made a director in the company in 1876. From 1882 to 1913 he occupied the position of treasurer, and in the latter year was elected president of the company, which office he held up to the time of his death. He was a director of the Rubber Manufacturers' Mutual Insurance Co., and served for two years as president of the New England Rubber Club.

J. H. FLINT.

Besides his interest in the rubber business, he was intimately connected with business and town affairs in Andover. For 34 years he was connected with the Andover Savings Bank, a part of that time as president, and was also a director in the Andover National Bank and a director in the Merrimack Mutual Fire Insurance Co. He served the town of Andover as selectman, assessor, town clerk, treasurer, chairman of the Water Commission, chairman of the Board of Public Works, and chief of the Fire Department. He was a member of Masonic and Odd Fellows Organizations, and of the Andover Club. In 1873 he married Miss Frances A. Tyer, who survives him, as do also two married daughters.

Mr. Flint was noted for his keen judgment in business matters. He was straightforward, shrewd, possessed of a kindly humor, and deserved and possessed a host of friends.

PIONEER RECLAIMER.

George Agnew, founder of the Raymond Rubber Co., Titusville, New Jersey, died early last month at Mercer Hospital, Trenton, New Jersey, aged 80 years. The Raymond company, which formerly operated under several other names, is a rubber reclaiming concern. After a long and successful career in the reclaiming business, Mr. Agnew retired from active work about eight or ten years ago, and three of his sons, Raymond H., Robert P. and John B. Agnew, now carry on the business.

MANY YEARS MANAGER OF A RUBBER COMPANY.

In the death of Frank DeWitt Hotchkiss, December 23, after long suffering with liver trouble, Fairfield, Connecticut, loses one of its most prominent citizens. For 28 years he had been manager of the Fairfield Rubber Co., now the Du Pont Fabrikoid Co. Indeed he had been identified with the rubber industry

from boyhood. Mr. Hotchkiss began his career in association with his father, who was one of the founders of the Goodyear Rubber Co., at Naugatuck, Connecticut, and upon his father's death became connected with the American Rubber Co., Boston, Massachusetts, whence he went to Fairfield permanently.

Held in high esteem by all, and regarded as one of the leading citizens of Fairfield, he never aspired to public office. He was a member of the Automobile Club of Bridgeport, the Wednesday Afternoon Musical Club, Trinity church vestry, Southport, Connecticut, and a charter member of Sentinel Lodge, I. O. O. F., of Naugatuck.

Mr. Hotchkiss was 65 years of age and is survived by his wife, three daughters and two sons.

DIRECTOR IN A RUBBER COMPANY.

Josiah Quincy Bennett, who died at his residence in Cambridge, Massachusetts, November 28, was a director in the Boston Woven Hose & Rubber Co., Cambridge. Mr. Bennett was born in Somerville, Massachusetts, 62 years ago, educated in the public schools of that city, and entered the banking business, but for years has been connected with electric light and power companies in New England and was identified with several other corporations. He is survived by his widow, three sons and one daughter.

A MANUFACTURER OF WEBBING.

Alfred C. Woodward, of the Victoria Webbing Co., North Abington, Massachusetts, died December 10, at Redlands, California, where he had gone in the hope of regaining his health. About the middle of October he had retired from business and leased his factory to his brother, George Woodward.

Mr. Woodward was a native of England, coming to this country at the age of 13 years and from that date being engaged in the webbing business. He was for a time manager of the Brighton mills, at Passaic, New Jersey, and for several years a member of the firm of Dean, Chase & Co., and manager of their goring factory at Rockland, Massachusetts, previous to establishing the Victoria company about 22 years ago.

PHOTOGRAPHS OF THE BRAZILIAN RUBBER INDUSTRY.

With the close of the great Panama-Pacific International Exposition, San Diego, California, comes a matter that may interest some in the rubber trade. It will be remembered that a wonderful collection of pictures illustrating the Brazilian rubber industry was exhibited, and these photographs are now to be sold. A complete list of them may be seen at the office of THE INDIA RUBBER WORLD, or by communicating with Dr. Eugenio Dahne, care of the A. T. Deer Co., Hornell, New York.

FACTORY DEDICATION AT LA CROSSE.

The La Crosse Rubber Mills Co., La Crosse, Wisconsin, dedicated the new addition to its plant on December 5, by a concert and ball, which was attended by over 5,000 persons. The new building was lavishly decorated, the second story used as a cloak room, the third as a cafeteria, where refreshments were provided, and in the upper was given an orchestral concert, during which addresses of welcome were made by President Hirshheimer, Secretary A. P. Funk and Treasurer A. S. Funk. The floor was then cleared for dancing, in which hundreds participated until the small hours of the morning. The affair was one of the most notable events in the history of La Crosse.

The new building is of modern, fireproof, concrete and steel construction, 210 feet long. The first floor will be used as a stock and shipping room, the other three for the manufacture of rubber footwear. The company now employs 675 persons. When the new building is equipped, it is estimated that there will be room for 1,400 workers in the entire plant, and the capacity will be increased to 25,000 or 30,000 pairs a day.

THE ANNUAL BANQUET AND MEETING OF THE RUBBER CLUB.

THE annual banquet of The Rubber Club of America, Inc., will be held at the Waldorf-Astoria, New York City, on the evening of January 8, at 6:30 p. m. The elaborate arrangements and interesting program prepared for this occasion will far surpass all previous efforts. The great interest shown by the members of the Rubber Club in this event promises a much larger attendance than that of a year ago.

Colonel Samuel P. Colt will be one of the speakers. Hon. William H. Taft will speak on "After the War, What?", and the subject of Bishop Du Moulin's speech will be, "The World Unrest." The address of F. A. Vanderlip will be a special message to the rubber trade.

The boxes in the banquet hall will be at the disposal of ladies and other guests, after 9:00 p. m., affording them an opportunity of hearing the after-dinner speakers.

The annual meeting will be held at the Waldorf-Astoria, January 8, at 2:30 p. m. The officers' reports will be submitted and the following nominations for directors during the ensuing year will be voted upon:

William E. Bruyn, L. Littlejohn & Co., New York City.
Van H. Cartmell, Kelly-Springfield Tire Co., New York City.
Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.
H. Stuart Hotchkiss, United States Rubber Co. System, New York City.
William J. Kelly, Arnold & Zeiss, New York City.
P. W. Litchfield, Goodyear Tire & Rubber Co., Akron, Ohio.
J. S. Lowman, Philadelphia Rubber Works Co., Akron, Ohio.
W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.
Charles T. Wilson, Charles T. Wilson Co., New York City.
Tracy S. Lewis, Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.
John A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey.
Charles A. Daniel, Quaker City Rubber Co., Philadelphia, Pennsylvania.

The annual meeting of the retiring board of directors will be held at the Union League Club, New York City, January 6, at 12:30 p. m.

The following division meetings will be held January 8, at the Waldorf-Astoria: The Mechanical Rubber Goods Manufacturers' Division, 1:30 p. m.; the Rubber Sundries Manufacturers' Division, 11 a. m.; the Fiber and Rubber Sole Manufacturers' Division, 10:30 a. m.

IMPROVED PACKING OF PLANTATION RUBBER.

THE Rubber Club of America, Inc., through its efficient Secretary, interviewed 60 leading rubber manufacturers upon the subject of improved methods of packing rubber. The following digest of suggestions contains much of value:

1. That a heavy paper be placed inside the boxes.
2. That rubber be packed in muslin or sheeting bags and then boxed.
3. That boxes be made to hold between 200 and 300 pounds to lessen handling.
4. That boxes be of a nature to permit the taking down and reassembling without the removal of binding iron and nails.
5. That cases be lined with tin and made stronger.
6. That one grade of rubber be placed in a case and that the top layers be of no better quality than the layers beneath it, in order to avoid deceiving the importer.
7. That a standard for the various grades of rubber be fixed by the Rubber Club in connection with the Rubber Importers' Association.
8. That a case be devised that has some practical method of opening the lid for inspection, to which cases of rubber are sub-

jected at various ports, without splitting it all to pieces and at the same time permitting of a fastening that would stand shipping.

9. That interior finish of cases be smooth and the joints made closer.

10. That a certain amount of soapstone be placed between the sheets of rubber to avoid moisture from sweating.

11. That hardwood cases be used.

12. That great care be used in cooping packages

13. That rubber be baled and burlapped.

14. That the present Japanese Momi cases be fastened securely around both end edges and also around the middle, both endwise and crosswise of the package, with metal strapping.

15. That in the case of Venesta boxes metal straps around all edges be nailed instead of riveted.

16. That less rubber be packed in cases.

17. That Jelutong and Red Serayah wood be used.

18. That a larger package be used divided into compartments in the middle to avoid rubber shaking down to one end of chest in transit.

19. That a rapidly revolving wire brush be applied to the interior of the box on a suitable vacuum cleaning nozzle.

20. That wider box stripping and special care as to the placing of nails be used.

21. That more care be given to the placing of the inscription on boxes of rubber "Store Away From Boiler."

22. That greater care be given to the unloading and reloading of ships and less handling take place in the warehouse.

23. That rubber be packed dry and not damp, causing a shrinkage above the 2 per cent allowed by sellers.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[242.] Names and addresses of manufacturers of the following are requested: Cartons, inner tube boxes, sheetings, liners, tapes and heavy gage sheet zinc for cutting tables.

[243.] A rubber company wishes to buy washed and dried rubber in ton lots.

[244.] A correspondent wishes to be placed in communication with an engineer or firm of engineers who specialize in constructing and mechanically equipping new tire plants.

[245.] Information is desired concerning the substance and manufacture of shellac compositions resembling hard rubber.

[246.] Names of manufacturers of tire valves and sundries have been requested.

[247.] A correspondent wishes to be placed in touch with manufacturers of tire fabrics, particularly breakers, thread and chafing fabrics, as well as tape.

[248.] Information is requested, with a view to purchase, regarding a machine that will put a bead on transparent dipped rubber goods such as balloons, nipples, etc.

[249.] The address of a manufacturer making steam cure splicing apparatus is desired.

[250.] A list of solid tire manufacturing concerns has been requested.

[251.] Manufacturers of inner tubes constructed of rubber and cotton fabric are sought.

[252.] A correspondent desires to know where to obtain candle tar.

[253.] Names and addresses of firms manufacturing machinery for extracting rubber from the guayule plant are requested.

[254.] An inquirer wishes to know what concerns make ball-bearing hand stitchers.

[255.] Names of manufacturers of dental rubber are requested.

[256.] A correspondent wishes to be placed in touch with manufacturers of tri-nitro-benzene.

[257.] Important manufacturers of rubber, celluloid and asbestos goods in Spain are eager to subscribe to American publications containing, regularly, information of interest to celluloid manufacturers.

[258.] An inquirer wishes to know where the different varieties of rubber seed may be obtained.

[259.] A correspondent asks who manufactures rubber gloves with cloth lining.

[260.] The names of makers of rubber sheet cutters or chop-pers are desired.

[261.] A correspondent requests information concerning manufacturers of woven cotton hose jackets.

[262.] Firm names and addresses of concerns manufacturing machines for cutting square hydraulic packing and pure gum strip packing are sought.

[263.] Names of manufacturers of test piece grinders and cutters are desired by a rubber laboratory.

[264.] A correspondent asks who manufactures the Rubin Duplex water bottle.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

A firm in Russia, with a branch office in the United States, would like to communicate with American manufacturers of garters, etc. Report No. 23,241.

A manufacturer of pharmaceutical products in Switzerland is in the market for collapsible tubes and sprayers for bottles. Report No. 23,248.

Representation of American manufacturers of garters is desired by a firm in Brazil. Report No. 23,302.

A man in Brazil is in the market for garters. Report No. 23,319.

A firm in India desires to communicate with American manufacturers and exporters of rubber heels. Report No. 23,323.

A Swiss firm is in the market for rubber cloth, rubber balls, tennis balls and raincoats. Report No. 23,325.

THE RUBBER CLUB OF MANAOS.

The *Clu¹ da Seringueira* is the name of an agricultural association recently formed in Manaus for the purpose of advancing the rubber planting industry of Amazonas, Brazil. "*A Seringueira*," the monthly official organ of the association, was first published on July 24, 1916, and has appeared regularly since that time. Its present scope and bulletin form will be enlarged in the near future, in order to reflect the practical knowledge and general information on the rubber planting industry now available.

DRESS SHIELDS FOR READY-TO-WEAR GARMENTS.

Dress shields of rubberized fabric are soon to become a regular part of all ready-to-wear gowns, suits and coats for women if the national campaign of a leading manufacturer succeeds. It is to be the contention that dress shields are just as necessary to a finished garment as hooks and eyes or other fasteners. The new spring garments will probably introduce dress shields to thousands of women not using them at present, so the retailer will benefit rather than suffer by the custom. As the life of a dress shield is about three months it must subsequently be replaced at the notion counter.

SAVAGE TIRE CO. DEVELOPS A SIDE LINE.

This firm has in its plant at San Diego, California, a complete equipment of metal work machines, and has begun the manufacture of the Thurston Motor Fuel Gasifier, a device for increasing gasoline mileage in motor cars and making possible the use of lower test distillate and other cheap substitutes for gasoline.

News of the American Rubber Trade.

NEW PRESIDENT OF THE GENERAL RUBBER CO.

ON his return from a five months' trip to the Far East, H. Stuart Hotchkiss, of the United States Rubber Co. System, was made president of the General Rubber Co., of New York.

H. STUART HOTCHKISS

This great company comprises the following subsidiaries: Wm. Symington & Co., Limited, London and Liverpool; the General Rubber Co. of Brazil, Manaos and Para; the General Rubber Co., Singapore, Straits Settlements, Colombo, Ceylon and Medan, Sumatra; the following rubber plantation companies: Hollandsch-Amerikaansche Plantage Maatschappij, Ashan Sumatra; Nederland Langkat Rub-

ber Maatschappij, Langkat, Sumatra, and Si Paré Paré Rubber Maatschappij, Tebing Tinggi, Sumatra.

Mr. Hotchkiss brings to his responsible position a peculiar fitness together with an unusual degree of preparedness. Thoroughly conversant with the factory side of the rubber trade though his long connection with L. Candee & Co., New Haven, Connecticut; with the administration end as a member of the Operating Council of the United States Rubber Co.; with the crude rubber end by reason of his many visits to the South American rubber centers and to the Far East, he knows all sides of his subject.

Other officers of the General Rubber Co. are as of yore, with the single exception of W. Stuart Gordon, who has become vice-president.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on December 23 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle Street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co. (new).....	72½	73
Firestone Tire & Rubber Co., common	135	140
Firestone Tire & Rubber Co., preferred	107	108
The B. F. Goodrich Co., common	59¾	60
The B. F. Goodrich Co., preferred	110	112
Goodyear Tire & Rubber Co., common	285	290
Goodyear Tire & Rubber Co., preferred	108¾	109½
Kelly-Springfield Tire Co., common	58½	60
Kelly-Springfield Tire Co., preferred	94	96
Miller Rubber Co., common	245	250
Miller Rubber Co., preferred	106	107
Portage Rubber Co.....	178	182
Rubber Goods Manufacturing Co., preferred.....
Swinehart Tire & Rubber Co.....	...	87
United States Rubber Co., common	60	62
United States Rubber Co., preferred	111½	113

Replete with information for rubber manufacturers.—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

SCRAP RUBBER DEALERS MEET.

The Rubber Scrap Division of the National Association of Waste Material Dealers held a meeting at the Hotel Astor, December 20, 1916, with Paul Loewenthal as chairman. After disposing of the routine business there was a discussion of trade matters generally that revealed a most satisfactory understanding between the members present. The classification committee recommended that no changes be made at this time, although some corrections may be made at the summer meeting. The grievance committee reported that no cases had been submitted for adjudication since the last meeting. Observance of specifications long in force in packing material are held responsible for this. Details of the new circular, which will be issued at the regular time, were fully discussed and found satisfactory. The attendance was good, about 25 members being present, and the banquet held that evening at the same hotel an unqualified success. The next meeting will be held in March.

AJAX RUBBER CO. ABSORBS RACINE.

At a special stockholders' meeting of the Ajax Rubber Co., Inc., New York City, the recent taking over of the Racine Rubber Co., Racine, Wisconsin, by the Ajax company was ratified. This consolidation is an important one, calling for an increase of capital stock from \$5,000,000 to \$10,000,000. The Ajax company has built up a national business through a large selling organization, while the Racine company has acted as distributor and built up a very profitable business at low selling cost, and the combination of interests will add to the power of both companies. The Racine Rubber Co. will maintain its corporate existence and will practically continue, without change, its selling policy, the Ajax company being used as a holding company for Racine stock.

RUBBER COMPANY DIVIDENDS.

The Rubber Goods Manufacturing Co. paid its 71st regular dividend of 1¾ per cent on preferred stock, December 15, to stockholders of record December 11.

The Boston Woven Hose & Rubber Co. paid the regular quarterly dividend of 3 per cent on common stock and semi-annual 3 per cent dividend on preferred stock, December 15, to stockholders of record December 5.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of 1½ per cent on 6 per cent preferred stock, payable January 2 to stockholders of record December 16.

The Barrett Co. has declared a quarterly dividend of 1¾ per cent on both common and preferred stock, payable January 2 to common stockholders of record December 20, and on January 15 to preferred stockholders of record January 5.

An extra dividend of 10 per cent on the common capital stock has also been declared, payable January 25, to stockholders of record December 20.

The board of directors of the Keystone Tire & Rubber Co., New York City, has declared a quarterly dividend of 2 per cent with an addition 1/3 per cent on the preferred stock and a regular quarterly dividend of 3 per cent on common stock, payable January 2 to stockholders of record December 22.

The Westinghouse Electric & Manufacturing Co. has declared a quarterly dividend of 1¾ per cent on the common stock, payable January 31, and a quarterly dividend of the same amount on the preferred stock, payable January 15, both dividends payable to stockholders of record December 30. The common dividend is an increase of ¼ of 1 per cent over the last payment.

M. M. CONVERSE.

MARQUIS M. CONVERSE, head of the Converse Rubber Shoe Co., Malden, Massachusetts, was born in Lyme, New Hampshire, October 23, 1861. After attending the district school

M. M. CONVERSE.

there he completed his education at the Thetford (Vermont) Academy, and at the age of 18 went to Sherbrooke, Province of Quebec, Canada, for about a year, as telegraph operator.

Coming to Boston in 1880, he entered the department store of Houghton & Dutton, where he officiated for a year as buyer, and for the

next five years as superintendent. His health then giving away, he was warned by his physician that he must go to the country. At Lebanon, New Hampshire, he then bought the small department store of G. W. Houghton, a brother of Samuel Houghton, of Houghton & Dutton, and the originator of the department store idea. There he remained until 1887 when, with health regained, he returned to Boston, and with Henry L. Pike formed the partnership of Converse & Pike and assumed the selling agency in that city of the Wales-Goodyear line of rubber footwear.

The new firm secured comparatively small space on the second floor of a building near the large store of W. L. Sage, at that time probably the principal rubber jobber in Boston. Within a few days, Mr. Sage, who, it will be remembered, always dressed in the height of fashion and rather showily, walked into the Converse & Pike establishment and introduced himself as "William Lincoln Sage, your competitor across the street." Taking it for granted that the young men knew nothing about the business, he at once offered them the opportunity to look over his establishment and see the arrangement of floor space and the building of bins for sorting the goods. Not only that, but he offered to impart to them any knowledge he might have regarding the credit of such customers as they might sell to, and in other ways showed his good will toward this competitor, which, in a facetious way, he had dubbed "the little pint cup rubber house."

In 1899 Mr. Converse had a nervous breakdown. Energetic and ambitious, he had worked for years without taking a vacation, and much of the time doing two or three men's work every day. The result was inevitable, and for three years he was obliged to remain out of business.

Having recovered his health, in 1902 he became the president of the Beacon Falls Rubber Shoe Co.'s distributing agency in Boston, and during the next six years was highly successful in building up the New England business for this new manufacturing firm.

As showing the perspicacity of George H. Lewis, then president of the Wales-Goodyear Co., when he chose Mr. Converse as the man to push his goods to the New England trade, he in-

sisted that the six-year contract should read that Mr. Converse should work but ten months out of twelve. Being a man of action, Mr. Converse demurred, but Mr. Lewis insisted on writing into the contract that he should keep away from business entirely during July and August of each year; that if at any time he attended to any details of business during those months, the contract should terminate.

In 1908 Mr. Converse determined to go into manufacturing on his own account, and established the Converse Rubber Shoe Co., building a small factory in the Edgeworth district of Malden, Massachusetts. His able management continued, and in the summer of 1916 the factory was greatly enlarged, more than doubling its capacity, and yet the demand for its goods was even greater than the factory could supply.

Mr. Converse is a man of quiet, forceful manner, with a wealth of original ideas, as is proved by his progress in the line to which he has devoted the greater portion of his business life.

PERSONAL MENTION.

Jesse E. La Dow, of the Mansfield Tire & Rubber Co., Mansfield, Ohio, is on the briny deep on his way presumably to the Far East; at least he wrote from Yokohama in November, having left Vancouver 15 days before on the Empress of Japan. The story of the memorable trip published in the "Mansfield News" is most interesting. However, one statement is, to say the least, remarkable. He says: "Our steamship was in sight of the Azores." Pretty far sighted to see the Azores from the Northern Pacific!

Mr. La Dow does far better, however, in a letter from Japan to the "New York Herald." There he cites the wages of the Japanese factory workers which are only one-tenth of what they are in the United States; in fact, constitute the lowest factory wages in the world. When the big Japanese rubber mills get into rubber lines where labor is the biggest factor, competition will be difficult, to say the least.

The many friends in the trade of Robert B. Baird, vice-president of the Rubber Trading Co., will be glad to learn that he has returned to his desk. Robert L. Baird has just returned from a trip to Cuba.

Gove & French, Inc., New York City, announce that Walter H. Bass is now associated with the company.

Mr. and Mrs. George W. Ryan, of East Orange, New Jersey, announce the engagement of their daughter, Miss Helen Hathaway Ryan, to Collier W. Baird, son of Mr. and Mrs. William T. Baird, and assistant treasurer of the Rubber Trading Co., 9-15 Murray street, New York City. Mr. Baird is a graduate of Yale Sheffield, class of 1910, and is a member of the Yale and Essex Country Clubs and of Essex Troop, with which he recently served on the border.

Rawson R. Cowen, son of the late Robert Cowen, has been added to the selling force of the New Jersey Rubber Co., Lambertville, New Jersey, rubber reclaimers, and will travel in New York, New Jersey and Pennsylvania.

O. D. Garretson, secretary and treasurer of the Electric Hose & Rubber Co., is president of the Manufacturers' Association of Wilmington (Delaware), also of the Employers' Association, and takes an active and enthusiastic interest in all matters making for the betterment of Wilmington as an industrial and home center.

Richard Weil, manufacturers' agent, well known in the East Indian crude rubber trade, has returned to the Far East after a two weeks' business sojourn in the United States. He expects to return to New York in June, 1917.

F. G. Hettell, having been associated with Parker, Stearns & Co., druggists' sundries manufacturers, Brooklyn, New York, as superintendent for over 25 years, has resigned to take effect January 1, 1917.

THE MANAGER OF THE "CANADIAN CONSOLIDATED."

J. A. WADE, who has recently been appointed manager of the Montreal factories of the Canadian Consolidated Rubber Co., Limited, is a man of wide rubber knowledge, 20 years' experience, and so particularly well equipped to weld together the several factory units in Montreal under the supervision of a

J. A. WADE.

central authority constantly in touch with the mills. His varied associations have embraced not only many of the manufacturing departments of the Dominion Rubber System, but both the factory and sales departments of a prominent rubber firm in the United States.

In 1895 he entered the employ of the Revere Rubber Co., Chelsea, Massachusetts. After four years' training in the factory he was transferred to the sales division to be-

come familiar with costs, selling methods and general office routine. There he remained four years more and then went on the road selling general rubber goods. Later, hearing of contemplated changes at the plant of the Canadian Rubber Co., of Montreal, he arranged to join the staff as assistant manager of the mechanical rubber goods division, and since that time has been associated with the mechanical line except during 1912 and 1913, when he was general superintendent of the B. & R. Rubber Co.'s factory at North Brookfield, Massachusetts.

Mr. Wade not only knows rubber manufacture well, but he has a keen insight of human nature. His success is due, in large measure, to constructive organization of the force under him. Superintendents, foremen and the operatives generally have confidence in his leadership and feel safe in his hands. That efficiency in every detail is to be encouraged may be seen in the weekly meetings of the foremen of his various departments, at which ways and means to improve the service are discussed. With the able assistance of Messrs. F. Jamieson and Henry Poole, superintendent and assistant superintendent, respectively, Mr. Wade's regime promises to be notable.

PAN-AMERICAN AERONAUTIC EXPOSITION.

New York is to have an aeronautic show. The first Pan-American Aeronautic Exposition will be held in Grand Central Palace, February 8 to 15, under the joint auspices of the National Automobile Chamber of Commerce, the Aero Club of America, the Pan-American Aeronautic Federation and the American Society of Aeronautic Engineers. Howard E. Coffin, of the Hudson Motor Car Co., is chairman of the Exposition.

Details have not been completely worked out, but it is probable that the motor and accessory manufacturers will participate. The Society of Automobile Engineers has extended its activities to include aeronautics, and will hold a technical session during the exposition for the discussion of present developments and possibilities of airplane engines. The S. A. E. standards committee is being reorganized in order to carry its work of standardization into the aeronautic field.

JUDICIAL DECISIONS.

BUFFALO SPECIALTY CO. V. INDIANA RUBBER & INSULATED WIRE CO. The case here reported was an appeal from the District Court of the United States for the District of Indiana, the appellant having brought suit to restrain infringement of all the claims of patent No. 578,551, granted to E. C. Duryea, March 9, 1897, for improvements in vehicle tires.

The device of the patent consists in a pneumatic tube or bicycle tire treated internally with a semi-liquid compound which, when a puncture occurs, is forced by the action of the compressed air within the tube into the aperture, and upon becoming exposed to the air thereby congeals and thus repairs the leak. The fluid, known as "dope," was not patented and, according to the patentee of the tube, may consist of any liquid or semi-liquid which will retain its free-flowing characteristics while contained within the tube, but will coagulate when exposed to the external atmosphere.

Infringement was based upon the following facts: The appellant was engaged in manufacturing and selling "dope"; the defendant, in making and selling pneumatic bicycle tires. The latter, being on November 5, 1898, the owner of the patent in suit, sold and conveyed it to the appellant's predecessor in title, the Buffalo Specialty Manufacturing Co., and took back, as a part of the transaction, what was in the transfer agreement termed "a shop license under said letters patent," granting the right to manufacture and use the dope, but withholding the right to its manufacture for sale except in a local retail way from the factories of the Indiana Rubber & Insulated Wire Co., and Peoria Rubber & Manufacturing Co., respectively. The appellee thereupon proceeded to manufacture the doped tire for over 11 years, when the business with the Chicago house of Sears, Roebuck & Co. attained immense proportions.

The appellant's contention was that it had no knowledge of the action of the appellee in building up such a large trade until about the time of the suit; that such action was in violation of the shop agreement, the true intent of which, it claimed, was that the appellee should make and use or make and sell the invention only in a local retail way from its two factories.

At the time this suit was begun the appellee also brought suit in an Indiana State Court for reformation of the contract or shop license; also for an injunctive relief, and damages. No complaint was made of the sale of "dope" as such, but only of its sale as an element of the tire of the patent.

The court dismissed the bill at the appellant's cost for want of equity, a decision which was afterward affirmed on appeal. This decision was pleaded as *res adjudicata* (a matter already settled).

The appellant's claim of infringement was based upon the proposition that the appellee, having breached the license contract by making and selling the device of the patent in quantities, became an infringer. The District Court sustained both non-infringement and the plea of former adjudication, and dismissed the bill for want of equity. This action of the District Court was assigned for error.

The Circuit Court of Appeals, Seventh District, before which the appeal for assignment for error came, held that the shop license authorized the defendant to manufacture in unlimited quantities tires with the patented device, the only restriction being upon the sale of the dope; this being particularly true in view of the fact that there had been a long acquiescence in the defendant's manufacture of tires. [The Federal Reporter, Vol. 334, pages 334 to 336.]

L. A. Watts, for three years manager of The Republic Rubber Co. of Texas, has been appointed general factory purchasing agent, with headquarters at the main plant, Youngstown, Ohio. R. E. Ratcliffe, for two years in charge of mechanical sales at The Republic Rubber Co. of Texas, succeeds Mr. Watts.

TRADE NOTES.

The United States Rubber Co. has acquired the business of the McCord-Norton Co., St. Joseph, Missouri, which will be continued under the same name as a branch store of the first-named company.

The recent fire at the Philadelphia (Pennsylvania) plant of The Barrett Co. was confined to one department, the loss being approximately \$25,000, fully covered by insurance. Plans for rebuilding have been prepared and the work will be completed and new equipment installed within 60 days.

The Cravenette Co. has been obliged, on account of increased business, to move to larger quarters on the seventeenth floor of the Hess Building, 354 Fourth avenue, New York City.

Extensive additions are being made to the Granby, Quebec, factory of the Canadian Consolidated Rubber Co., Montreal, Canada.

Eastern factories are so congested with orders that the Portland Rubber Mills, Portland, Oregon, has been asked to bid on an order for 3,000,000 small rubber washers. Incidentally this shows to what extent this practical little rubber device is used.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has established a bonus system for its salaried employes, similar to that which has been in operation for some time among wage earners. The bonus, paid monthly, is 8 per cent, provided absences and tardiness do not exceed six hours, or more than three occasions. Those who have lost no time receive an additional 4 per cent.

A new warehouse of reinforced concrete with outside walls of solid pressed brick, has been added to the Regina (Saskatchewan) branch of the Canadian Consolidated Rubber Co., Limited. The building is designed for five stories and basement, but has for the present two stories and basement. It is 50 by 100 feet wide with a loading platform 50 by 13 feet, facing the railway spur track, and contains all the latest improvements. The Dominion rubber factory of this company at St. Jerome, Quebec, is also being enlarged to meet the increased demand for "Fleet Foot" shoes.

Owing to constantly increasing business in its surgeon's gloves, the Halifax Rubber Co., Halifax, Pennsylvania, is enlarging its plant and installing new machinery and equipment.

The Philadelphia (Pennsylvania) office of the Goodall Rubber Co., Inc., is now located at Eleventh and Race streets, and the New York City office and warerooms at 72 Murray street. These changes afford three times the former wareroom space in both cities.

The Habirshaw Electric Cable Co., 10 East Forty-third street, New York City, has let a contract for the construction of a two and three-story addition to its manufacturing plant at Yonkers, New York, 200 by 300 feet.

The Electric Cable Co., Bridgeport, Connecticut, has awarded a contract for a four-story addition 57 by 130 feet.

Mulconroy Co., Inc., has removed to more commodious quarters at 528 Fourth avenue, Pittsburgh, Pennsylvania, where a full stock of the Mulconroy line of hose, "7-League" sewed leather-soled rubber boots, etc., will be carried.

Owing to the restriction of imports during the past year, there has been an unusual development of the chemical industries in the United States. There has been a large increase in the number of by-product coke plants which are utilized in the production of many compounds formerly imported from Germany. The products referred to include the following that are used in the rubber industry: benzol, solvent naphtha, toluol, carbolic acid, and cresylic acid.

The Court of Appeals has ordered L. G. De Cant to pay for the \$1,000 worth of stock in the C. A. White Rubber Co., Watertown, New York, which he subscribed for but never received, the money to go to the creditors in bankruptcy of the company. This case has been in the courts for a number of years.

K. V. Hawby, a Dane, and his brother, Axel S. Hawby, having pleaded guilty to shipping dental rubber as passengers' baggage on Scandinavian-American liners, were recently sentenced to ten days in the Tombs, theirs being the first prison sentences to be imposed on shippers who violated United States customs laws in attempts to run the British blockade.

The Merchants' Association of New York has just issued an important pamphlet opposing government ownership and operation of public utilities, and advocating exclusive regulation of all railroads by the Federal Government. It presents a masterly summing up of logical arguments that the Association's Committee on Transportation will support before the Newlands Commission, which is about to begin an investigation of this entire matter.

The Republic Rubber Co., Youngstown, Ohio, recently received an order for railway hose the volume of which doubles the amount of this class of business that the company has had for years.

Work has been commenced on the addition to the plant of the New York Rubber Co., Beacon, New York. The new building will be two stories high and 50 by 100 feet.

The Kelley Rubber Co., Cleveland, Ohio, will increase its output as soon as a suitable factory building can be located.

The Goodall Rubber Co., Inc., Philadelphia, has moved to larger quarters in the Commercial Building at Eleventh and Race streets. For a number of years it has been located at 19 North Seventh street.

A Zanesville, Ohio, brick company recently closed a contract for 20,000,000 bricks to be used for additions to Akron rubber factories.

A new rubber factory devoted to the manufacture of druggists' sundries and toys is projected by C. V. Martin, of Newcastle, Pennsylvania, to be located at Norwalk, Ohio, in the very early future.

Work is being rapidly rushed on the buildings of the Brunswick-Balke-Collender Co.'s factories in Muskegon, Michigan. Machinery installation is expected to commence January 1.

The Millbury Rubber Co., Millbury, Massachusetts, notice of whose incorporation appears elsewhere in this issue, has taken over the plant of the Stoddard Rubber Co., Inc., at Millbury, the latter company having discontinued business. The Millbury company manufactures four sizes of non-skid tires. The present capacity of the mill is 160 tires a day, and it is planned to increase this shortly to 300.

The fiftieth anniversary of the founding of The Loewenthal Co., Chicago, Illinois, will be celebrated on New Year's Day. This well-known waste rubber concern operates extensively throughout the country and also carries on a large export and import business.

Kaufman & Rosenberg, dealers in scrap metals and rubber, have moved to 2994 Park avenue, New York City, where they occupy a three-story brick building, provided with the latest equipment for rapid and efficient shipment.

Wallace L. Gough & Co., dealer in crude rubber, gutta percha and balata, has joined offices with Richard Gough, Corn Exchange Bank Building, 11-19 William street, New York City, with A. T. Mason as associate.

AMAZON TIRE EXPANSION.

The Amazon Tire & Rubber Co., Akron, Ohio, has appointed Owen Moynihan as eastern district manager with headquarters in New York City. Among the recent additions to the staff of Amazon dealers may be mentioned Ralph E. Becker, Buffalo, New York, and the Strong, Carlisle & Hammond Co., Cleveland, Ohio.

INDEPENDENT RUBBER CO., LIMITED.

In *THE INDIA RUBBER WORLD* of December 1, 1916, was published an account of the formation of a new corporation, the F. E. Partridge Rubber Co. In that notice it was stated that this corporation had leased the factory of the Independent Rubber Co., at Merritton, Ontario. This is not the fact. The Partridge Company has leased the plant of the Independent Tire Co., at Guelph, Ontario.

The Independent Rubber Co., Limited, at Merritton, has not discontinued business, nor has it leased its factory. On the contrary, it is running to full capacity on orders, the demands for its rubber footwear having become so great that the management has recently been obliged to decline business.

S. A. E. EXTENDS ACTIVITIES.

The Society of Automobile Engineers, whose scientific investigations and standard specifications have done so much for the advance of the automobile industry, has extended its activities to the aeronautic, tractor and motor boat fields. The recently established Buffalo section will devote considerable attention to this work, and the newer activities are prominently reflected in the program of papers to be read at the annual meeting of the society, to be held in New York City, January 11, at the time of the automobile show. During the First Pan-American Aeronautical Exposition, to be held at Grand Central Palace, February 8 to 15 inclusive, a technical session of the society will also be held.

NEW PLANT OF THE HENRY L. SCOTT CO.

The Henry L. Scott Co., Providence, Rhode Island, builder of precision testing machines for rubber, cotton fabric, cords and other materials, has recently occupied its new factory at Blackstone and Culver streets. As shown by the accompanying illustration, the plant consists of a two-story building of heavy mill construction with basement 35 by 68 feet; a boiler house 18 by 35 feet in the rear; and a storehouse 22 feet square at one side.

The main building is equipped with sprinklers and safety devices throughout. Exceptionally large windows have been

provided and the shop is otherwise well lighted, both gas and electricity being employed. All machinery is operated by electric motors and materials are carried from floor to floor by an electric elevator. The first floor is devoted entirely to the manufacture of machine parts. Castings and raw stock are stored in the basement, and the snagging and painting are also done there. On the top floor are located the offices, drafting room, assembling and shipping departments. Visitors interested in the testing of materials and the obvious advantage of buying and selling them by specification are welcome.

ROSENWALD & WEIL ARE PROGRESSIVE.

The accompanying illustration was made from a photograph showing a portion of the exhibit that was recently held in the Chicago showrooms of Rosenwald & Weil, maker of rubber

products and rubberizers of all kinds of fabrics. There were shown the raw materials, such as crude rubber, chemicals, compounding ingredients, and fabrics used in the manufacture of the various products made in the Chicago plant, a picture of which was appropriately draped with a sheet of the best plantation crêpe rubber.

In addition to the complete line of rubber clothing, there was shown a variety of rubber specialties, including "Imperial" sheeting, piano bellows cloth and rubber cement, made by this company and distributed by their selling force all over the world.

DRY CLIMATE TIRE COMPANY MEETING.

At the annual stockholders' meeting of The Dry Climate Tire Manufacturing Co., Arvada, Colorado, held December 2, 1916, the following directors were elected: E. A. Austin, president, Boulder, Colorado; W. J. H. Doran, president Denver Manufacturing Association, George P. McKenney, Denver, Colorado; R. S. Van Tassell, Cheyenne, Wyoming; C. H. Allyn, Hardin, Colorado; Daniel A. Lord, Denver; J. F. White, Arvada.

The auditors' report showed a substantial profit, indicating future dividends. The purchase of additional equipment of molds, presses and vulcanizers was authorized to increase production in accordance with present demands.

THE BUCYRUS RUBBER CO.

At a stockholders' meeting of The Bucyrus Rubber Co., Bucyrus, Ohio, on December 4, the following directors were elected: George Donnenwirth, W. A. Blicke, A. G. Stoltz, H. A. Paxton, A. J. Richards, Phil. Browassky, Phil. Heater, William Schwenck, and Jacob Colter. On December 8, the directors met and elected the following officers: Phil. Heater, president; George Donnenwirth, vice-president; W. A. Blicke, treasurer; C. P. Mader, secretary. The affairs of the company were reported to be in good condition, and it is anticipated that business for next season will be greatly increased.

POST ACQUIRES BANNER RUBBER SHOE PLANT.

The plant of the old Banner Rubber Co., St. Louis, Missouri, which has been idle since that firm's retirement from the rubber shoe business several years ago, has been acquired by the Post Tire & Rubber Corporation, of New York City, and will be opened at once with a large force. The factory has a floor space of 70,000 square feet and a daily capacity of 1,200 automobile tires and 15,000 pairs of rubber boots and tennis shoes.

TIRE PRICES MAY BE ADVANCED.

FOLLOWING the rise of about 12½ per cent. in tire prices early last year is now seems probable that prices will soon be advanced again from 15 to 20 per cent. Dealers usually order heavily about this time for spring delivery, and the fact that two of the largest manufacturers have instructed their agents to accept only orders for immediate shipment seems to foreshadow a general advance. This refusal of forward orders is due to the unsettled conditions affecting crude material prices. In this connection it is a somewhat anomalous fact that every production cost, including compounding ingredients and labor, has long since advanced greatly, except rubber itself. Until October rubber had actually been a little lower than a year ago, but during the past three months the trend of the market has been upward to an advance of about 20 per cent. Tire building fabric now sells at about double the prices prevailing a year ago. Oxide of zinc, lampblack and all compounding ingredients are relatively high, and whiting has nearly doubled in cost, so that on the present price schedule the margin of profit in tire manufacture is small.

A THREE-SECTION AUTOMOBILE TIRE.

A pneumatic tire that differs radically from the ordinary casing and tread construction, is the subject of the following illustration and description. This tire has two separate side walls while the tread is a separate section, as will be seen by referring to the figure on the right. The conformation of the

outer ends of the two side walls and both sides of the tread is such that when assembled with the inner tube, a few pounds' inflation suffices to lock the sections firmly together.

Among the advantages claimed for this novel construction are greater protection to the tube, and danger of punctures and blow-outs minimized. The tread is readily interchangeable, as the side walls of a given size are identical; moreover, the tread may be used on any corresponding standard tire, making the retreading of a worn-out tire a very simple matter. It is also apparent, from the inventor's claims, that when the sectional tire becomes hopelessly worn or damaged, in the great majority of cases, it will be necessary only to replace one-third of the tire to make it serviceable again. [D. C. Roberts, Trenton, New Jersey.]

ASBESTOS FOR TIRE FABRIC.

Long-fibre asbestos spun into thread has been suggested and even used to a certain extent as a substitute for cotton in the manufacture of tire fabric. While some experts hold to the opinion that it cannot have the tensile strength of cotton fabric, its possibilities in connection with an unusually broad breaker strip of woven wire extending about the side walls are particularly interesting at a time when the Egyptian cotton crop is restricted; the Sea Island crop is threatened by the ravages of

the boll weevil; the total American cotton crop is nearly 3,000,000 bales below normal; and the cotton demand for miscellaneous purposes is unprecedented. The breaker strip referred to is composed of fine wire, bound with asbestos, woven into fabric and rubberized. Time will substantiate the sweeping claims of superiority based upon strength and nonconductivity of heat if they be well founded. Meanwhile, it is certain that mineral asbestos is not rotted by moisture percolating through cuts in the tire tread and carrying along some of the sulphur of vulcanization. Herein, perhaps, lies its chief claim to notice as a possible substitute for cotton tire fabric.

AUTOMOBILE ACCESSORY WEEK.

THE seventeenth Annual National Automobile Show under the auspices of the Motor and Accessory Manufacturers will be held at Grand Central Palace, New York City, January 6 to 13, and at the Coliseum and First Regiment Armory, Chicago, January 27 to February 3. More than 340 exhibitors have been allotted space, most of them at both shows. In this list of exhibitors are the following names which are familiar to readers of THE INDIA RUBBER WORLD:

Adamson & Co., Inc., New York City.
 Asch & Co., Inc., New York City.
 Brunswick-Balke-Collender Co., New York City.
 Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.
 Eastern Rubber Co., Philadelphia, Pennsylvania.
 Essex Rubber Co., Trenton, New Jersey.
 Eureka Rim Compressor, Inc., Addison, New York.
 General Tire & Rubber Co., Akron, Ohio.
 Hill Insulating & Manufacturing Corporation, New York City.
 Mattson Rubber Co., Lodi, New Jersey.
 Mutty, L. J. Co., Boston, Massachusetts.
 Pittsburgh Electric Specialties Co., New York City.
 Rubber Insulated Metals Corporation, Plainfield, New Jersey.
 Western Electric Instrument Co., Newark, New Jersey.

There will be 98 cars exhibited, while 218 accessory manufacturers will display their lines. Many elaborate arrangements and novel effects are being planned for this exhibition.

SOCIETY OF AUTOMOBILE ENGINEERS.

The week in New York City will be a busy one. The Society of Automobile Engineers, which now has 370 members, will hold its annual meeting during the week. On Tuesday there will be a preliminary session of the Standards Committee. The regular business meeting will be held Wednesday, at which officers will be elected and proposed constitutional amendments discussed. The afternoon session will be devoted largely to aviation subjects. Thursday will be given over to professional papers and discussion of automobile subjects. A buffet luncheon will be served at noon. This meeting will be held at the Engineering Societies Building, 29 West Thirty-ninth street.

The annual banquet will be held at the Hotel Biltmore, Thursday evening. Three short addresses on subjects of interest to the automobile industry will be important features. The 750 diners in a body will then attend a midnight theatrical performance as a climax to the function.

MOTOR AND ACCESSORY MANUFACTURERS.

The Motor and Accessory Manufacturers, which now number 260 members, will hold their thirteenth annual meeting at the Waldorf-Astoria Hotel, New York City, Wednesday, January 10 at 3 o'clock, following this with the Ninth Annual Banquet at the same hotel at 7:30 P. M. An efficient banquet committee is in charge, and the affair promises to be the banner occasion of this association. On Thursday, January 11, the board of directors will hold an important meeting at the offices of the association.

NEW INCORPORATIONS.

Batterman, Rood Rubber Co., The, October 24 (Massachusetts), \$150,000. John J. Batterman, 95 Newbury street, Boston; Warren B. Rood, 585 Franklin street, Melrose Highlands; Robert W. Daniels, 16 Harrison street, Brookline; Thomas H. Dumper, 15 Fernwick Road, Winchester—all in Massachusetts. To manufacture and deal in shoes, clothing, etc., made in whole or in part from rubber or other similar materials.

Beacon Rubber Co., Inc., December 13 (New York), \$50,000. Herbert T. Auerbach, Statler Hotel; Harold A. Forbes, 241 Maryland street, and L. B. Dietz, 40 Laurel street—all in Buffalo, New York. To manufacture rubber goods, etc.

Bering Tire & Repair Co., November 24 (Texas), \$20,000. A. C. Bering, Jr., John W. House and Hamblen Pattison—all of Houston, Texas. Principal office, Houston, Texas. To deal in tires. This company succeeds the Bering Tire & Rubber Co.

Colton Demountable Rim Corporation, December 12 (Delaware), \$2,500,000. L. R. Sheldon and L. N. Downs, New York City, and George H. Roeder, Brooklyn, New York. Principal office, United States Corporation Co., Dover, Delaware. To manufacture and deal in rims for automobiles, especially the Colton Demountable Rim.

Goshen Rubber & Manufacturing Co., October 25 (Indiana), \$5,000. Charles Noel (president and treasurer), Henry W. Pease (secretary and sales manager), and John Lash. Principal office, Goshen, Indiana. To manufacture mechanical rubber goods, rubber molds and machinery.

Guarantee Tire & Rubber Co., November 4 (Indiana), \$70,000. G. F. Kreitlein (president); C. W. Minesinger (vice-president), Walter W. Kuhn (secretary). To deal in casings, tubes and accessories.

International Rubber Sales Co., November 1 (Indiana), \$10,000. Marc Wile, Leah Wile, and Alex D. Rodgers, Jr. Principal office, Evansville, Indiana. To buy, sell and repair automobile tires and accessories.

Interstate Elastic Braid Co., Inc., December 6 (New York), \$5,000. Samuel Sagor, 336 First street, Brooklyn, New York; David G. Herman and Charles Herman, 126 East Twelfth street, New York City. To manufacture elastic braid.

Lapp Insulator Co., Inc., December 14 (New York), \$150,000. John B. Abbott, Geneseo; Harlan W. Rippey and Samuel Levy, Rochester—both in New York. Principal office, LeRoy, New York. To manufacture electrical apparatus, insulating materials, rubber, etc.

Marine Rubber & Chemical Co., Inc., The, December 9 (New York), \$1,000. James B. Pelton, 197 Penn street; Richard Murphy, 540 Fifty-seventh street—both in Brooklyn, New York, and Frank A. O'Rea, 6 Mangin street, New York City.

Metallic Auto-Tire Co., November 1 (Massachusetts), \$500,000. Constantine P. Govostos, 355 Harrison avenue, Boston; Joseph Lazarus, 25 Sea Foam avenue, Winthrop, and Alexander O. Szeitz, 53 Piedmont street, Worcester—all in Massachusetts. Principal office, Lynn, Massachusetts. To manufacture and deal in metallic tires, automobiles, etc.

Millbury Rubber Co., November 15 (Massachusetts), \$90,000. Albert W. Blackmer, J. Otis Sibley, and Ruth E. Price—all of Worcester, Massachusetts. Principal office, Millbury, Massachusetts. To manufacture and deal in all kinds of crude rubber or rubber compounds, tires, and articles made of rubber and other compounds.

Parker Collapsible Rim Corporation, August 23 (Delaware), \$3,000,000. Lawrence Angel, Cedarhurst, Long Island, New York; George J. Soden, 386 One Hundred and Sixty-first street, New York City; Sidney S. Lesser, 1935 Bergen street, and Louise Frankel, 592 Decatur street—both in Brooklyn, New York. Principal office, Delaware Charter Guarantee & Trust Co., 328 du Pont Building, Wilmington, Delaware. To manufacture and deal in rims, parts and appliances in connection with automobiles and other motor vehicles.

Quick Lock Demountable Rim Co., November 14 (Massachusetts), \$50,000. James Norrie, 78 Chauncy street, Charles F. Crowell, Room 22, Ames Building—both in Boston, Massachusetts, and James W. Stevens, 9 Summit avenue, Brookline, Massachusetts. Principal office, Boston, Massachusetts. For the purpose of holding, buying, selling and dealing in patents and patent rights and automobile accessories.

Reuter Rubber Co., November 9 (New Jersey), \$250,000. George Joseph Reuter, 182 Montclair avenue; Alfred Strauss, 75 Hedden Terrace, and Frederick Seligman, 202 Fifth street—all in Newark, New Jersey. Principal office, 11 Clinton street, Newark, New Jersey. To manufacture and deal in tires and tubes.

Rubber Pachit Corporation, December 18 (New York), \$30,000. Frederic W. Rogers and Edward Goldfarb, 40 Exchange Place, and V. C. Bogardus, 140 Nassau street—both in New York City. Vulcanizing materials, tire repairing, etc.

Scientific Rubber Heel Co., Inc., December 8 (New York), \$200,000. William H. Arrington, 619 West One Hundred and Thirty-fifth street, New York City; Blanchel A. Murrelle, 1716 Caton avenue, and Ellis S. Helwitz, 1129 East Fifteenth street—both in Brooklyn, New York.

Servis Tire & Tube Co., December 1 (Delaware), \$100,000. F. D. Buck, George W. Dillman and M. L. Horthy—all of Wilmington, Delaware. Principal office, Delaware Charter Guarantee & Trust Co., 328 duPont Building, Wilmington, Delaware. To manufacture and sell tires and tubes.

Standard Tire Valve Co., September 13 (Massachusetts), \$100,000. Michael F. Clarke and John Luther, 40 Central street, and John W. McCormack, Tremont Building—both in Boston, Massachusetts. Principal office, Boston, Massachusetts. To build, construct, manufacture and deal in tire valves, etc.

Triple Airless Tire Co., September 21 (Delaware), \$150,000. Andrew C. Heilman, Butler; J. M. Martin and F. W. Daugherty, Grove City—both in Pennsylvania. Principal office, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To manufacture and deal in the Triple Airless tires, and other tires and rubber goods.

Tu-Shu-Tire Corporation, December 13 (New York), \$5,000. William C. Moore, 1178 Broadway; William P. Herrick, and Gerard P. Herrick, 61 East Seventy-third street—all of New York City.

United States Rubber Co., December 7 (Delaware), \$100,000. Henry B. Hubbard, 1540 Seventy-second street; John D. Carberry, 822 Greene avenue—both in Brooklyn, New York, and George H. Mayo, 159 Corlies avenue, Pelham, New York. Principal office, Corporation Trust Co. of America, 394 duPont Building, Wilmington, Delaware. To purchase, sell and deal in goods, wares and merchandise of which rubber is a component part. This company was organized to operate the business heretofore carried on by certain branch store selling companies in various parts of the United States.

Wayne Tire & Rubber Co., November 3 (Indiana), \$3,000. W. R. Britton, H. T. Whitney, E. J. Wohlfeld. Principal office, Indianapolis, Indiana. To deal in tires, accessories, etc.

FINAL SETTLEMENT OF THE PERLMAN RIM SUIT.

Through the payment of \$1,010,000 by the Standard Welding Co., Cleveland, Ohio, to the Perlman Rim Corporation, in settlement of back royalties, the famous Perlman rim suit, referred to in several previous issues of THE INDIA RUBBER WORLD, has been virtually closed, although certain legal formalities still remain to be complied with. Thus the last Stanweld debt to Perlman has been paid and the plant will henceforth manufacture rims under a Perlman license. The factory space is to be enlarged next summer to about 1,600,000 feet.

Of value for daily reference in every rubber office.—"The Polyglot Rubber Trade Directory, 1916."

PERSONAL MENTION.

John Kearns has been elected general manager of the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, in full charge of manufacturing, and plans are being made for a material increase in the production and capacity of the plant under his management. Formerly Mr. Kearns was vice-president of The Fisk Rubber Co., Chicopee Falls, Massachusetts, and previous to that he organized the British Dunlop Co. of Australia, with which he was connected for 12 years.

W. M. Pound succeeds Millard Ritter as local manager of the Charlotte (North Carolina) depot of The B. F. Goodrich Co., Akron, Ohio.

E. Duffy has joined forces with the Kelly-Field Co., selling agency for the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, and hereafter will devote his experienced attention to the merchandising of Lee tires. He was formerly sales manager of the Midgeley Tire & Rubber Co., and prior to that was connected with the Hartford Rubber Works Co.

H. R. Platt, recently with the Batavia Rubber Co., has been appointed assistant superintendent of the tire department of The Gordon Tire & Rubber Co., Canton, Ohio.

J. F. Thompson has been appointed general district manager of the New York branch of the Sewell Cushion Wheel Co., Detroit, Michigan.

J. D. Cary has been promoted to the position of southern district manager for the Kelly-Springfield Tire Co., New York City. Mr. Cary was formerly manager of the Atlanta (Georgia) branch, where he is succeeded by Amos W. Whaley.

George M. Martin is in charge of the new branch of the Kelly-Springfield Tire Co. at Minneapolis, Minnesota. For the past eight years Mr. Martin was connected with the Firestone Tire & Rubber Co., Akron, Ohio, as manager, respectively, of its Omaha, St. Louis and Minneapolis branches, and therefore brings a wealth of experience to his new position.

R. W. Llewellyn has been placed in charge of the branch store and wholesale depot recently opened at Columbus, Ohio, by the Kelly-Springfield Tire Co.

R. C. Bubb, of Grimley, Limited, agents for the Firestone Tire & Rubber Co., at Sydney, Australia, recently returned from an extended visit to the United States for the purpose of studying factory and export conditions. Mr. Bubb states that, although a part of the British Empire, Australia buys most of its automobiles, tires and motor car accessories from the United States.

A. E. Hertzog has been made manager of the Washington, D. C., branch of the Goodyear Tire & Rubber Co., Akron, Ohio. He was formerly employed as manager of the Baltimore branch and will now take charge of both territories. L. J. Gemmil, former manager of the Washington branch, will devote his time to looking after the government business.

George M. Stadelman, vice-president of the Goodyear Tire & Rubber Co., Akron, Ohio, is now in South America with his family. While the trip is taken mainly for recuperation, Goodyear interests in that region will doubtless claim a share of his attention.

G. W. Henne, general manager of the Mansfield Tire & Rubber Co., Mansfield, Ohio, has recently decided to turn over five acres of the company's ground to be devoted to garden purposes for the benefit of the employees. The company will plow, irrigate and supply seed for each employee who may desire to raise his own food stuffs.

Henry C. Plow, at one time treasurer of the Hartford Rubber Works, and more recently vice-president and sales manager of the Midgeley Tire & Rubber Co., has purchased and will operate the Automobile Owners' Accessory Co., Limited, of Montreal, Canada. The company will be renamed and reincorporated.

E. A. Jacob has become manager of the Portage Rubber Co.'s Des Moines (Iowa) branch. He succeeds J. W. Wildman, who has been transferred to the Chicago offices.

James G. Budd, of The Fisk Rubber Co., Chicopee Falls, Massachusetts, recently completed an 11 months' tour in the Far East, in the interests of the company's export and service department. Mr. Budd's successful mastery of about 20 different tongues and dialects peculiarly fits him for such an undertaking.

C. M. Folger, Pacific Coast manager of the Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, has been spending the last few weeks in the Hawaiian Islands, visiting Marathon distributors and gathering information on conditions in that territory.

WESTINGHOUSE TO INCREASE CAPITAL.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, will increase its capital by the addition of \$15,000,000 of common stock, provided the recent resolution of the board of directors is authorized by the stockholders at a special meeting called for February 15. All plants of the company are doing capacity business and many profitable contracts have had to be declined. The new issue of stock will permit the immediate erection of a much needed plant at Essington, Pennsylvania, just outside of Philadelphia, at an expense of \$5,000,000 to \$7,000,000.

A WELL-KNOWN INVENTOR AT WORK.

TO see men in their offices is almost as interesting as to meet them in the flesh, and it is a pleasure occasionally to have an opportunity to show the daily surroundings of those who have contributed materially to the advance of rubber manufacture. The accompanying illustration shows Arthur Jackson Wills, the well-known inventor, in his office at North Brookfield, Massachusetts, explaining the model of one of his recent inventions to Mr. Lindholm of the Pneumatic Scale Corporation. Mr. Wills is a mechanical engineer of exceptional ability, and since his association with the B. & R. Rubber Co., of North Brookfield, Massachusetts, has devoted himself with marked success to the

OFFICE OF ARTHUR JACKSON WILLS.

design and manufacture of special rubber machinery. Keen insight and a first-hand knowledge of the needs of the industry, coupled with a positive creative ability, have brought forth several time and labor-saving devices which have been adopted by leading rubber manufacturers in Europe as well as America. His automatic, carton filling machine was soon followed by a rubber overflow trimmer for rubber heels and other molded goods—his most widely known invention—while the device just recently placed upon the market is a rubber edging plaiter. It is known that more patents are pending, and it is reasonable to assume that in his future work Mr. Wills will round out a much broader sphere of helpfulness to the rubber trade.

TRADE NOTES.

The Keaton Tire & Rubber Co. has moved into larger quarters at 636 Van Ness avenue, San Francisco, California, the new two-story and basement quarters having three entrances and affording every convenience for proper service.

The Meyer Rubber Co. is erecting a plant at Massillon, Ohio, for the manufacture of automobile tires and tire accessories.

The Gillette Safety Tire Co., Eau Claire, Wisconsin, has increased its capital stock to \$1,000,000. Work is progressing rapidly on the plant, and it is expected that by March or April the capacity will be more than doubled. C. G. Race, formerly general manager of the Chicago branch, is now general sales manager at Eau Claire.

The Estabrook-McGraw Tire Co., 1646 Broadway, Denver, Colorado, is a new distributing agency for McGraw tires in Colorado and extensive adjacent territory in the Rocky Mountain region.

The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, has opened a new department for the manufacture of rubber and composition soles and heels, with Frank B. Rickaby in charge.

The Hester Tire & Rubber Co. has acquired a three-acre site in Delphos, Ohio, on the Fort Wayne division of the Pennsylvania Railroad and the Clover Leaf Route, and will there erect a series of modern two-story factory buildings, of brick and concrete construction. Each unit will be 50 by 150 feet and will contain approximately 15,000 feet of floor space. It is expected that part of the plant will be in operation by spring.

To facilitate the shipment and storage of its tires, the Savage Tire Co., San Diego, California, has added to the group of its factory buildings a warehouse of brick and steel construction. It is erected on the tracks of the San Diego & Arizona Railroad and will handle all the carload shipments, besides being used as a supplementary storehouse for raw materials and an overflow storehouse for finished tires.

The Good-Wear Rubber Co. has purchased for \$30,000, property comprising 1½ acres of ground centrally located in Elyria, Ohio. The existing buildings on this property, having a floor space of 25,000 to 30,000 square feet, will be remodeled very shortly, the company expecting to manufacture tires in the late spring or early summer.

The Porter Rubber Co., Salem, Ohio, has raised its capital stock from \$125,000 to \$250,000, because of increased business, the new stock to be taken by present stockholders. This company already has a new, modern factory with a capacity of 350 tires and a like number of tubes per day.

The Watson Suspension Wheel Co., Franklin, Pennsylvania, has raised its capital stock from \$50,000 to \$150,000. This company holds the patents for the Triple Airless tire, which is made under contract. The officers are as follows: J. M. Martin, Grove City, Pennsylvania, president; A. C. Hileman, vice-president; Fred W. Daugherty, secretary and treasurer.

The Fox-Senior Tire Co. has decreased the amount of its authorized capital of \$20,000 to \$10,000.

The assets and liabilities of The McClurg Rubber Co., Coshoc-ton, Ohio, have recently been taken over by the Midland Tire & Rubber Co., which will operate in the old McClurg company's building at Coshoc-ton. Three tires of different grades, including a cord tire, and also tubes, will be manufactured. Wilmer Dunbar will act as general manager.

The Batavia Rubber Co., Batavia, New York, has filed complaint with the Interstate Commerce Commission charging the Atlantic Coast Line Railroad, and connecting lines, with dis-

crimination in rates with respect to its articles of manufacture on shipments meant for so-called Southern Classification territory by way of Ohio River crossings. The complaint alleges that this discrimination extends to classes of tires as follows: First class, on pneumatic tires, in any quantity; second class on solid tires, any quantity; and, third class, on all others, such as tires in steel casings. The complainant asks the commission to order rates which will cause "a larger spread" between the carload and less than carload lots.

The Goodyear Tire & Rubber Co., Akron, Ohio, has also filed a petition for reclassification of freight rates on tires shipped via the Atlantic Coast Line and other railroads in the South.

The Mutual Film Corporation will equip all of its motor cars with a specially constructed non-skid tire which will write the name of Charlie Chaplin in the dust of the road three times for each wheel revolution. Between imprints of the name will be footprints of the world's champion foot-worker, on the shoe of the tire.

The Iowa Rubber Tire Co., of Bettendorf, Iowa, has recently purchased the plant formerly occupied by the American Can Co. for \$70,000. It is claimed that the company has signed three tire experts from Akron, Ohio.

The Good-Wear Rubber Co., Elyria, Ohio, is said to have commenced operating. It is estimated that the company will employ 150 men and make 300 tires and 200 tubes daily.

It is understood that the contract for erecting the Kelly-Springfield Tire Co.'s plant at Cumberland, Maryland, has been let for \$2,500,000. Building will commence March 1.

Production has begun in the newly-built pneumatic tire factory of the J. & D. Tire & Rubber Co., at Charlotte, North Carolina. George Knowles, a scientific rubber man with 16 years' practical experience in tire manufacturing, is superintendent.

At the annual sales conference of The McGraw Tire & Rubber Co., East Palestine, Ohio, December 6 to 9, S. L. Warner was appointed assistant sales manager, and R. J. Delavan, special representative. C. K. Whittaker, former Pacific Coast district manager, was made Pacific Coast district manager, with headquarters at San Francisco, California. There was a full attendance of district managers at the conference, and C. E. Miley, general sales manager, presided.

A certificate of authority to do business in Illinois has been issued to The Gordon Tire & Rubber Co., an Ohio corporation with a capital stock of \$600,000. The principal office in Illinois is located in Chicago.

EMPIRE RUBBER & TIRE CO.'S NEW PHILADELPHIA OFFICE.

The new home of the Philadelphia (Pennsylvania) branch of the Empire Rubber & Tire Co., of Trenton, New Jersey, is a large four-story and basement building centrally located at 810 North Broad street. One of the main reasons for erecting this new building was to improve the service end of the company's business, and the rear portion of the first floor, 20 by 86 feet, is given over to the service station, allowing plenty of room to run cars inside. Experts will be in charge of this department, capable of giving advice to patrons which will insure the greatest possible service from the tires.

The entire second floor is used for the stock room. It is equipped with four rows of tire racks, each 160 feet long and extending to the ceiling, three tiers high, and with accommodations for at least 10,000 tires, everything being arranged to facilitate the quick handling of stock. The storage room for the many varied products of the company is on the third floor, and a completely equipped repair shop in charge of expert tire men occupies the entire fourth floor. An electric elevator runs from the first to the top floor.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE concentration of the American rubber industry in Akron has made possible a much larger growth than if it were scattered over a larger territory. For example, the extended research work carried on by the large and wealthy companies here has advanced the industry with phenomenal rapidity, affording as it does, ever new uses for rubber.

In 1910 the population numbered only 69,000, as compared with the 51,150 people now employed here in rubber manufacture. Although every variety of rubber goods is extensively produced, the tire industry is the main element. It is claimed that Akron manufactures over 70 per cent of all the automobile tires used in the world. The past year's production of tires totals over 11,522,650. Every factory is operating to full capacity and constant additions are being made to floor space and equipment, to meet the ever increasing demand. Taking these facts into consideration, over 20,000,000 tires is considered a safe prediction for 1917.

The taxable value of the great plant of The B. F. Goodrich Co. amounts to almost half of the total of \$43,896,440 placed upon the 168 industries located in Akron and Summit County. Just how the rubber manufacturing business dominates in Akron, and the immensity of it, is shown by the following valuations for the different companies:

The B. F. Goodrich Co.....	\$20,392,830
Goodyear Tire & Rubber Co.....	7,631,780
Firestone Tire & Rubber Co.....	4,964,980
Kelly-Springfield Tire Co.....	1,371,930
Miller Rubber Co.	1,121,910
Portage Rubber Co.....	331,880
Swinehart Rubber Co.....	459,270

A total of \$36,220,580 is credited to the rubber manufacturing industry, more than four-fifths of the entire manufacturing activities of Akron and its suburbs.

Side by side with economic prosperity, social welfare for the benefit of the workers has flourished. The B. F. Goodrich Co. maintains a department of industrial relations, with divisions of labor, health and safety, including provision for illness, life insurance, recreation, etc. The splendidly equipped Firestone clubhouse has been previously described in these columns. The Goodyear Tire & Rubber Co. makes a specialty of athletics and also maintains a factory school. The Miller Rubber Co. has inaugurated an adjustment board among the employees of the employment department, allowing them to make minor adjustments of difficulties arising among workers. A well-equipped hospital has also been recently installed by the Miller company; an athletic field has been provided, all essential equipment for various sports being purchased by the company; and study clubs on practical business questions are being organized, with evening classes, including supper served by the labor department at actual cost.

* * *

For some time the Firestone Tire & Rubber Co. has been planning to enter the rubber footwear field, and a new department specially adapted to this line of manufacture is now in full swing. Extensive research undertaken by the company for a good substitute for leather soles—so prohibitive in cost at present—has resulted in the production of an entirely new line of fiber rubber soles and heels of sturdy quality which are now being offered to the shoe manufacturing trade. S. S. Patrick, formerly with the Beacon Falls Shoe Co., Beacon Falls, Connecticut, has been named as manager of footwear sales, and Harry D. Hamilton, formerly of the John H. Parker Co., Malden, Massachusetts, will act as footwear sales representative. P. D. Hammond is superintendent of the footwear factory. During the month of January, the complete line of footwear will be on display in Boston, Massachusetts, for the benefit of visiting buyers. The Firestone Tire & Rubber Co. is now aiming to produce

20,000 tires a day, and the accompanying illustration shows one of the new buildings in its process of expansion, designed to house all repair and mechanical departments. It is built of reinforced concrete and brick, with large steel-sash windows, and

ADDITION TO FIRESTONE PLANT.

contains approximately 86,000 square feet of floor space. Another separate building is also being erected and another story is being added to the main factory buildings.

The convention of branch managers of the Firestone company on December 12 to 14 was the first of its kind ever held. Office managers from 46 branches, traveling auditors and officials at the home office were all in attendance. The business sessions were held in the new clubhouse and there was much interesting discussion of business methods and conditions and a general exchange of ideas, which form so valuable a part of these get-together meetings.

President H. S. Firestone welcomed the visitors to the Akron office and delivered a short address. Other officers of the company who spoke during the convention were R. J. Firestone, vice-president; J. G. Robertson, treasurer; S. G. Carkhuff, secretary, and A. G. Partridge, general sales manager.

Arrangements were in charge of F. B. Dodge, branch organization manager, and the well-planned social program included a dinner in honor of the visitors at the Portage Country Club, banquets and theater parties; also a minstrel show, staged especially for the convention, and presented by the home office force.

President Firestone has been chosen as chairman of the Akron committee for the Rubber Club banquet to be held in New York City on January 8.

The Firestone Advertising Club has been formed by members of the advertising department and plans have been formulated for bringing to Akron prominent advertising men who will address the members on subjects of particular interest to the advertising fraternity. There are over 30 men in the Firestone advertising department, which numbers over a hundred people in all. Officers of the new club were elected as follows: F. K. Starbird, president; Don Bregenzer, vice-president; H. B. Garske, treasurer, and R. V. Cline, secretary.

* * *

The capital stock of the Punctureless Auto Tire Co., manufacturer of the King Tubeless tire, has been increased from \$100,000 to \$1,000,000. The company's plant is situated on 20 acres of land between Kenmore and Barberton. The main building is 60 by 300 feet and the power plant 36 by 100, two stories high. In the early spring two reinforced concrete and brick buildings 80 by 400 feet, four stories high, will be erected, orders for machinery for these large buildings having already been placed. Edward Hackathorn is president of the company.

* * *

The books of the Goodyear Tire & Rubber Co. show a remarkable record for the past year. Gross business jumped from

\$36,000,000 to \$63,000,000, an increase of 80 per cent over 1915, and net earnings for last year were \$7,000,000 as against \$5,000,000 for the preceding year. The comparative table of the business for the two years is as follows:

	1916.	1915.
Sales	\$63,950,400	\$36,490,652
Net earnings	7,003,330	5,137,083
Preferred dividend	764,239	469,583
Common dividend	1,261,332	727,248
Stock dividends	8,427,000
The condensed balance sheet as of October 31 is as follows:		
Assets—	1916.	1915.
Plant and equipment.....	\$12,689,056	\$7,846,207
Quick assets	30,682,264	14,566,858
Other assets	5,846,474	3,866,862
Total	\$49,217,794	\$26,279,927
Liabilities—		
Capital stock	\$35,000,000	\$15,027,200
Current liabilities	9,167,973	1,944,600
Reserves	2,796,654	2,276,187
Surplus	2,253,168	7,031,940
Total	\$49,217,794	\$26,279,927

All the directors were reelected, as follows: F. A. Seiberling, C. W. Seiberling, G. M. Stadelman, F. H. Adams, P. W. Litchfield, H. B. Manton and J. P. Loomis. The directors in turn reelected the officers, as follows: F. A. Seiberling, president; C. W. Seiberling, vice-president; G. M. Stadelman, vice-president and sales manager; P. W. Litchfield, vice-president and factory manager; A. F. Osterloh, secretary; F. H. Adams, treasurer; W. E. Palmer, assistant secretary and assistant treasurer; H. J. Blackburn, second assistant treasurer.

During the present coal shortage the Goodyear company is supplying coal to its employees at cost.

L. C. Rockhill, manager of the auto tire department at the home office of the Goodyear company, and Mrs. Rockhill, with J. S. Willamen, district credit manager, and Frank E. Carroll, manager of the San Francisco branch, are taking a month's trip together in the Hawaiian Islands.

* * *

The Faultless Rubber Co., Ashland, Ohio, manufacturer of rubber sundries and specialties, remembered its employees at Christmas time in a unique and substantial manner. Each received a \$500 life and disability insurance policy for the protection of dependent relatives, the amount of which will be increased at the rate of \$100 annually until the maximum of \$1,000 is reached.

* * *

E. H. Trader, formerly with the American Express Co., has accepted a position as general salesman with the American Rubber & Tire Co., with headquarters at the Akron office.

* * *

The Falls Rubber Co., Cuyahoga Falls, Ohio, has increased its capital stock from \$300,000 to \$500,000.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber industry in the matter of Christmas presents has been vividly illustrated by the Bailey Rubber Co., of this city, whose store, because of extensive and effective advertising in the daily papers, has compared favorably with department stores as regards the number of customers, compared to the area of floor space. C. J. Bailey is a generous advertiser, of long and varied experience, and his advertisements of "Useful Christmas Gifts," giving long lists of raincoats and rubber clothing, footwear, household articles, etc., and especially rubber toys, brought customers to the store by hundreds. Mr. Bailey, when

asked if business had been good with him, modestly replied in the affirmative, but the significant smile he wore spoke louder than words of his satisfactory holiday trade.

* * *

Another Boston institution which is doing an extensive business in rubber goods is the United Drug Co., whose chain stores are numbered in the thousands in many sections of the country. The importance of this institution in the rubber trade will be appreciated when it is stated that in six weeks over 75,000 hot water bottles were sold, and that the concern buys them in lots of 300,000 each. This is but one item of the rubber goods line which this company distributes. The latest innovation of the company is interesting. Already an order has been given for over 100,000 inner tubes for automobile tires. When a motorist needs an inner tube, he needs it as the Texan needs a pistol—mighty quick. Some garages stock no inner tubes, or only a limited number of sizes. Not all garage men carry the best makes, and the motorist must buy what he can get. There are now more Rexall stores than garages and the drug company management believes that with its reputation for quality, with its thousands of retail stores, all prominently situated, and nearly all of them open or accessible at all hours, there is a good prospect of selling half a million, or even a million inner tubes this year. These tubes will bear a special trade-marked name, owned by the company.

* * *

F. H. Appleton & Son, Inc., manufacturers of reclaimed rubber, have just completed a large addition to their plant at Franklin, Massachusetts. It is a three-story structure, 150 by 50 feet. As soon as this is in operation, the capacity of the plant will be nearly trebled. A new laboratory building has also been added, and equipped with up-to-date apparatus and appliances. As hitherto, Francis H. Appleton, senior, makes his headquarters at the Boston office, 185 Summer street, and Mr. Appleton, junior, will continue in charge of the manufacturing at the Franklin plant.

* * *

The Monatiquot Rubber Works Co., at South Braintree, Massachusetts, continues to add to its extensive plant and is breaking ground for the erection of another brick mill building. This is to be two stories high, 190 by 60 feet, and will closely follow in style the lines of the recently erected No. 2 building. To make room for the new addition, it was necessary to move the office building some little distance toward the center of the mill yard, and the journey was safely made without interfering with the office routine.

The new addition to factory No. 3 had a fitting dedication during the early part of December, when a member of the Billy Sunday party held a "shop meeting" there during the noon hour. Not only the company employees attended to a man, but invitations were also extended to the employees of the neighboring factories; and as a result of the enthusiasm shown, the management arranged for a weekly meeting during Mr. Sunday's stay in Boston.

The company's Christmas distribution this year took the form of savings bank accounts which were opened in the names of the individual employees. Each man was awarded an amount proportionate to his length of employment. It was felt that this plan would work out advantageously, and would be the means of inspiring each one to add regularly to his nest egg.

* * *

The Elastic Braid & Lace Co., a comparatively new corporation, has secured the factory and business of the A. M. Greenway Co., Chelsea, Massachusetts, and is manufacturing elastic cords, laces and braids for the shoe, corset and suspender trade. George Fickessen, who for several years managed the Greenway business, is treasurer of the company and has charge of the manufacture. Charles M. Porter is president and sales manager. Mr. Porter's office at 179 Summer street was badly damaged

recently by an extensive fire on the street floor of the building, as a consequence of which he has moved the Boston salesroom to 170 Summer street, the main office of the company being at Chelsea.

* * *

The A. B. S. Cement & Rubber Co., Inc., notice of whose incorporation appeared in the December issue of THE INDIA RUBBER WORLD, has moved into a new factory at Haverhill, Massachusetts, where it will manufacture rubber cement for the shoe trade and other industries. The officers are as follows: A. B. Alden, president; D. C. Smith, vice-president; M. A. Smith, treasurer; W. E. Bixley and G. H. Bixley, directors.

* * *

L. D. Apsley, president of the Apsley Rubber Co., Hudson, Massachusetts, is using his best endeavors to secure good housing for the employees of his company. He recently bought two estates on which he has built 16 houses, and there are now eight more in process of erection. He is also encouraging other operators to build suitable homes both for sale and for rent. It is safe to say that few manufacturing towns have better accommodations for workers than Hudson, and for this Mr. Apsley is to a large extent responsible. The Apsley Rubber Co.'s factory is running to the largest ticket in its history, with a force of about 1,500 hands.

* * *

The Dexter Manufacturing Co., 727 Atlantic avenue, Boston, manufacturer of rubber cements, with a factory at South Braintree, Massachusetts, has enlarged the scope of its activities, and is selling rubber soles and heels to the shoe manufacturing trade.

* * *

J. Frank Dunbar is president and Griswold Stowe treasurer of the J. Frank Dunbar Co., dealers in crude rubber and allied products. Mr. Dunbar has been prominent in this trade for years, being connected with Geo. A. Alden & Co., of this city. Mr. Stowe was formerly of the Stowe & Woodworth Co., proofer and manufacturer of mechanical goods, Campello, Massachusetts, selling out his interest in that concern to join Mr. Dunbar in forming the new company. The Boston office is at 201 Devonshire street, and the New York office at 71 Beaver street, the latter being in charge of J. Frank Dunbar, Jr.

* * *

A serious fire occurred at the plant of the Plymouth Rubber Co., in Canton, Ohio, on the morning of December 15, when the reclaiming department was entirely destroyed by fire, at an estimated loss of \$10,000.

* * *

Thomas A. Forsyth, president of the Boston Belting Co., was signally honored late in November in being made an honorary member of the Sigma Delta Sigma fraternity, this being the first instance in over half a century that this fraternity has admitted to its membership any one outside of the dental profession. This was, of course, because of Mr. Forsyth's great benefaction, the Forsyth Dental Infirmary, presented to the City of Boston.

* * *

Robert W. S. Cox, formerly New England salesman, and for the last few years sales manager for the insulated wire department of the National India Rubber Co., Bristol, Rhode Island, is now in business on his own account, having recently opened an office at 10 High street, this city. He will deal in insulated wires and cables, confining his trade to large jobbers and central stations. He has an unusually large acquaintance in this line of business throughout the country.

* * *

Harry G. Fisk, treasurer of the Fisk Rubber Co., Chicopee Falls, purposes to add to his various other activities by entering the dairy business on a rather extensive scale. He has purchased three adjoining farms in East Longmeadow, Massachusetts, comprising, in the aggregate, 125 acres, the highest and most

sightly land in the town. Next spring he will begin the erection of a handsome summer residence, and later farm buildings. He hopes, in a few years, to be the owner of a valuable herd of cattle.

* * *

P. D. Hammond, who will have charge of the new footwear department of the Firestone Tire & Rubber Co., Akron, Ohio, was in Boston early last month. Mr. Hammond was formerly connected with the Diamond Rubber Co., the Goodyear Tire & Rubber Co., and The B. F. Goodrich Co.

* * *

M. S. Connelly, formerly of Hoyt's Service and the Greenleaf Co., Boston, has been appointed advertising manager of the Hood Rubber Co., Watertown, Massachusetts.

* * *

Charles Bonney has been appointed manager of the factory of the E. H. Clapp Rubber Co., at Hanover, Massachusetts, and Martin Mullin, who has been connected with this concern for more than a quarter century, has been made superintendent.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber plants throughout the state continue to be rushed with work, as they have been during the past year, and there are no evidences of any immediate diminution of the demand. For the first time in many weeks there is practically no trouble brewing among the employees of the different plants. In consequence of the increase in wages that has been put into effect during the past month, labor troubles have entirely disappeared and the managers and superintendents are correspondingly happy. Many of the manufacturers, however, are worried over the continued lack of expert or even competent employees, but this seems to be a situation that cannot be remedied under existing conditions.

Large shipments, many of them abroad, are being made daily from most of the plants, and it seems to be the general belief that the present schedule of work will be maintained for another year at least, this prediction being based upon the amount of orders now on hand or in prospect.

* * *

James Morrison, well known throughout New England from his connection with the rubber manufacturing industry in Chicopee, Massachusetts, and Providence, died at his home, 360 Lockwood street, in the latter city, late Monday afternoon, December 18. Early in the month he met with a severe accident at the service station of the Invincible Tire Co., 93 Fountain street, where he was foreman, by which one of the fingers of his left hand was so badly crushed in a pumping machine that it had to be amputated. Blood poisoning developed and resulted in his death. He was in his forty-fifth year.

Mr. Morrison was born in Glasgow, Scotland, in June, 1872, first coming to this country about a quarter of a century ago. With the exception of two or three years while he was in his native country, he had been in America since that time, making his home in Albany, New York, Springfield, Massachusetts, and Providence. He was first connected with The Fisk Rubber Co., as foreman of its factory at Chicopee Falls, Massachusetts. After a few years he moved to Providence to accept the position of inspector at the Revere Rubber Co., but for the past five years he had been in charge, as foreman, of the service station of the Invincible Tire Co. He is survived by his wife and one son. Fraternally, he was prominently identified with Clan Cameron of the Royal Scottish Clans.

* * *

Business at the factory of the National India Rubber Co., at Bristol, has been increasing to a great extent during the past few weeks and it is probable that steps will be taken with the commencement of the new year for a still further increase in the output of sporting and outing shoes. It is understood that the present output of 48,000 pairs each working day will be increased

to 55,000, necessitating an increase of employes, who now number upwards of 4,000. There are said to be orders enough on hand at present to keep the factory going for two years.

A number of important changes among the office force at the factory of the National India Rubber Co. have been made during the past month, several resignations making room for promotions in various departments. Arthur H. Emerson, who has been treasurer of the company for several years, has been appointed credit manager and assistant general sales manager of the wire division of the concern, and entered immediately upon the duties of his new position.

Maurice C. Smith, Jr., who has been a clerk in the office for a number of years, has been appointed assistant treasurer and will have full charge of the office and accounting department. Ralph W. Holt, formerly of Hudson, Massachusetts, who has been at the factory for the past two months, has been permanently assigned to take charge of the footwear department, under the management of the order, ticket and shipping departments.

William H. Gardiner has been appointed to succeed James H. Hoar, resigned as overseer of the varnishing and vulcanizing department. Mr. Hoar had been foreman of this department for nearly thirty years. He entered the employ of the National Rubber Co., as it was then called, in the autumn of 1866, working for several years in the varnishing and curing of rubber goods, until he acquired a skilled knowledge of his work. In 1877 he was appointed assistant foreman, Stephen Bourn, a former well-known rubber man, being then in charge of the department. In 1887 Mr. Bourn retired and Mr. Hoar succeeded him.

* * *

At the Narragansett Rubber Co. factory, at Bristol, the 700 employes are working full capacity in order to fill all demands and there are orders on hand sufficient to keep the plant in operation to its limit for many months to come. The concern has recently purchased a lot of land with a dwelling house thereon, at the corner of Wood and Catherine streets, which will be used in the expansion of the company's plant, made necessary by the constantly increasing business demands.

Terrence McCarthy, owner of the Narragansett Rubber Co., formerly the Consumers' Rubber Co., who has been confined to his home by a severe attack of the grip during the greater part of the past month, is able to be about again.

* * *

A contract for the erection of an addition to the box factory of the Alice Mill of the Woonsocket Rubber Co., at Woonsocket, has been awarded. Two stories will be added to the present building, in which are manufactured boxes used in the shipment of the products of the factory.

John F. McBride, who resigned last April as foreman of the packing department of the Alice Mill, of the Woonsocket Rubber Co., died at his home, 416 Second avenue, Woonsocket, on December 13 after a few weeks' illness of heart trouble. Last March he had an attack of pneumonia and never fully regained his health. He was born in Elderly, Scotland, but coming to this country with his parents, resided at Woonsocket from infancy. He was educated in the parochial school connected with St. Charles church and after leaving school entered the employ of the Woonsocket Rubber Co. He had been foreman of the packing department for more than 17 years when he resigned.

* * *

The Rhode Island Tire Co., 109-111 Broadway, Providence, is being conducted by Leonard Hinchcliffe, according to information filed at the office of the city clerk.

* * *

James R. Newbold, who for the past five years has been head calender man at the International Rubber Co., at West Barrington, has been promoted to the foremanship of that department.

* * *

Richard Unsworth, the old-time watchman at the Revere Rubber Works, on Valley street, Providence, had a narrow escape

recently from being killed on one of the elevators at the company's plant. He was confined to the Rhode Island Hospital several days.

* * *

William Howe has been made superintendent of the night forces at the Revere Rubber Co., and Charles Donovan, who had held that position for a number of years, has been promoted to the day service.

* * *

The creditors of George H. Decker, who conducted a retail rubber goods store under the style of The Decker Rubber Co., at 76 Weybosset street, Providence, held a meeting in bankruptcy recently at the office of the referee, Nathan W. Littlefield, and appointed Rhodes U. Eldred as trustee. The business has been disposed of by the trustee, who is now adjudicating the estate. The business is being continued by the Arcade Rubber Co. at the same address.

* * *

Frank S. Bowker, of Worcester, Massachusetts, has been appointed assistant superintendent at the American Wringer Co. plant, at Woonsocket, to fill the vacancy occasioned by the promotion of Jesse P. Walsh to the superintendency on the death of Michael M. Flynn, who had been superintendent for more than a quarter of a century. Mr. Bowker was connected with the Scotia Worsted Co., of Woonsocket, a number of years ago, but of late has been employed as supervisor at the Du Pont Powder Works, in New Jersey.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

SHORTAGE of soft coal has become a serious factor in Trenton. Many of the rubber manufacturers have been hard pressed for fuel on more than one occasion, but they have managed to keep steam up and the wheels moving. The local trolley line was unable to operate its cars for a short time last week because of inability to get coal.

* * *

A compressed air tank in the plant of the Joseph Stokes Rubber Co. exploded recently. Damage to the extent of about \$200 resulted. No one was seriously hurt, although several employes were in grave danger.

* * *

The John A. Roebling's Sons Co. has purchased 3,000 tons of structural steel for building operations it proposes starting in the spring. A considerable part of the steel, it is said, will be used in erecting an insulated wire mill.

* * *

The Delion Tire & Rubber Co. recently entertained its employes at a formal dinner in Geartner's. George H. Graham, Jr., secretary of the company, was toastmaster. H. H. Coleman, president of the company, was among the speakers.

* * *

Employes of the Empire Rubber & Tire Co. gave a generous contribution toward a fund to provide Christmas toys for the poor children of Trenton.

* * *

Trenton's first electrical show, recently brought to a close in the Masonic Temple, was a big success and largely attended. Insulated wire makers and other firms making rubber specialties for electrical goods participated.

Included in the number were the Thermoid Rubber Co., Joseph Stokes Rubber Co., Hamilton Rubber Co., U. & G. Rubber Manufacturing Co., John A. Roebling's Sons Co., and Home Rubber Co.

* * *

When the newly furnished State Museum is opened in the Capitol there will be an exhibit showing the method of making an automobile tire and the machinery employed in the operation.

The India Rubber Trade in Great Britain.

By a Special Correspondent.

AT the moment the trade is busy on all kinds of waterproof goods, not only for use at home, but also for the soldiers on the Continent. The wet season has caused a great demand for trench capes, waders, trench coats, trench boots, ground sheets, cap covers, cycle capes, scouts' suits, cyclists' overalls, motor hood cloths, and there continues to be a steady demand for gun breech covers, gas mask goods, respirator tubes, tires and numerous other articles for military use. Practically every rubber house in the Kingdom must be working on at least one class of government orders. In some quarters difficulty is being experienced in meeting the heavy requirements but, generally speaking, good deliveries are being made against existing contracts.

LEATHER BOOTS PREFERRED FOR THE ARMY.

Rubber boots are proving unsatisfactory at the front. British soldiers who have had three pairs report that all have been destroyed by barbed wire. Good leather boots are necessary. Some of the Canadian troops have high-legged boots with buckles up to the legs which are giving good service.

RUBBER PRICES.

Rubber companies are issuing new price-lists which show an advance. General mechanical rubber goods show an increase of 10 per cent from November 6, 1916, making the total advance since April, 1915, about 30 per cent. Hose, rubber belting and packing have advanced 15 per cent from the last previous price-lists, making for these articles a total advance of 35 per cent. Tire prices are substantially unaffected. It is generally understood that all fabrics for the rubber trade will now have to be quoted from 12½ to 25 per cent up, according to the class of yarns from which they are manufactured.

British manufacturers are steadily building up a trade in many lines of goods formerly manufactured in Germany and they would probably be doing much more than they are in this direction were their facilities not so heavily taxed with government orders and scarcity of male labor.

Our manufacturers do not have to look for business just now, it comes to them, and here is where their troubles begin. Once the business is obtained, first comes trouble in securing materials to execute the orders, and then comes difficulty in getting out the goods owing to the government demands for men all over the country.

NEW USES FOR RUBBER.

Hardly a day passes without bringing a demand for some use of rubber previously unheard of, and this is generally in connection with the war. For example, orders were recently placed with manufacturers for bags and coverings for listening posts. These bags and coverings are to be used for protecting very delicate instruments used in detecting movements of the enemy below, above and on the surface of the earth. It seems to be reasonable to affirm that no other commodity is so rapidly extending the range of its usefulness as rubber is, and, no doubt, many of the new uses of rubber the war has developed will continue in peace time.

HOT WATER BOTTLES.

The demand for rubber hot water bottles is large and buyers for concerns trading in this class of goods are receiving many offers from American and Canadian manufacturers who are generally to be represented by people unknown to the trade here and apparently unfamiliar with the rubber business.

The trade does not consider the American and Canadian-made bottles as durable as those of British manufacture. It is hard to say whether or not there is any serious basis for this belief, but it is certain that there is a feature in American-made bottles

which our manufacturers could well afford to imitate. This is a projecting semi-circular flap extending about half an inch from the bottom of the bottle and perforated. The great advantage to be seen in this is that it facilitates hanging upside down for complete drying, an improvement that is sure to be much appreciated by the user.

RULINGS ON IMPORT RESTRICTIONS.

In connection with the restrictions on the importation of certain goods, the following rulings have been made:

PROHIBITED.

- Cotton bias bindings for use on rubber and canvas shoes.
- Elastic of rubber and cotton, if cotton exceeds 50 per cent of the total weight.
- Garlock packing.
- Rubber-faced cotton fabric.
- Bicycle-tire valves.
- Canvas, solution coated, used in the manufacture of boots and shoes.
- Fabrikoid.
- "Omo" sheeting [cotton fabric coated with waterproof solution].

IMPORT ALLOWED BY GENERAL LICENSE.

- Balls, tennis.
- Cotton duck for belting weighing 11 ounces and upwards per square yard.
- Goods consisting wholly or mainly of rubber.
- Rubber-covered rollers for clothes wringers.

NOT PROHIBITED.

- Bakelite heads for umbrella handles.
- Ebonite fork separators for use in connection with electric train lighting.
- Elastic of rubber and silk.
- Elastic surgical trusses.
- Gummed cloth tape.
- Hard ebonite tubes for use in connection with electric insulating.
- Hose, garden hose, mainly of rubber.
- Inner-tubes for motor cars.
- Paragon tape for insulating joints in electric wires and cables.

ADVERTISING CONTINUES.

Despite the fact that the private use of motors has been greatly curtailed by various government orders, advertising for both automobiles and tires continues in our papers.

The North British Rubber Co., Limited, and the Dunlop Rubber Co., Limited, are both conspicuous advertisers; the latter is especially in evidence both in newspapers and magazines. Most of the tire advertising very naturally emphasizes good records made by the various tires under the exceptionally rigorous conditions of war service.

American tire manufacturers such as The B. F. Goodrich Co., the Goodyear Tire & Rubber Co., and the Firestone Tire & Rubber Co., are also remarkably active in advertising their wares.

The Michelin Tyre Co., Limited, has been running a very interesting advertisement in "The Times" entitled, "Endurance Will Gain the Victory," and illustrating four ways in which Michelin is participating in the war: (1) aeroplane and army tires; (2) 3,000 employees under the colors; (3) the Michelin hospital; (4) the Michelin shell factory.

A very human trait is exhibited in nearly all motor and tire advertising, and that is the desire on the part of the advertiser to let the public know how much he is doing for his country.

The tire agencies exhibit placards in their front windows telling how many of their men are at the front. In all the advertising of British concerns the "Buy from a British Maker" sentiment is played hard for getting business now and after the war.

WITH RUBBER TIRES ONLY.

The fact that a British manufacturer of steam wagons has placed on the market a 6-ton steam vehicle designed exclusively for use on rubber tires is notable. Steam lorries have been in use in England for many years, and it has been the custom to build them with steel tires, or with tires made up of wooden plugs. Of late solid rubber tires have been made optional and many users have found economy in the increased speed possibility and the protection from the wear and tear of excessive road vibration afforded by resilient rubber tires, but the new Atkinson 6-ton steamer is the first of its kind to be offered for sale with anything but rubber tires.

HOLLAND SHORT OF TIRES.

Tires are greatly needed in Holland, according to C. A. Geerkens, of H. Englebert & Co., The Hague, automobile dealers. American motor cars find a ready sale there, but are invariably shipped without tires, as no rubber goods are now allowed to pass the Allied blockade into neutral European countries whence they might find their way into Germany. Meanwhile, used tires are accorded that solicitous care which a faithful servant deserves.

PRIVATE SHIPMENTS TO RUSSIA RESTRICTED.

The Commercial Attaché of the Imperial Russian Embassy wishes to bring to the attention of American shippers interested in forwarding goods—including rubber articles—to Russia, via Vladivostok, the fact that the importation of private shipments is temporarily forbidden except under special permit. The existing regulations governing the importation of goods via Archangel apply at present to Vladivostok. It is necessary to make application for each individual shipment through the Russian consignee, to the Imperial Department of Commerce, Petrograd.

EXPORT OF RUBBER SOLUTIONS RESTRICTED.

The exportation from Great Britain of rubber solutions containing coal-tar products and derivatives is now prohibited to all destinations, except under license, which will not be granted if a solution contains any considerable percentage of benzol.

Manufacturers have been instructed to get in touch with the Department of Explosives Supplies, Ministry of Munitions of War, in order to ascertain the nature of the substitute for benzol, which in future should be employed in the manufacture of rubber solutions.

RUBBER EYES.

Two French inventors, Drs. Lemaître and Teuillières, have devised a system for making an artificial eye that can hardly be distinguished from a real one. They aimed at producing a substance of sufficient elasticity and softness to respond to the changes in the eye socket, and at the same time of sufficient hardness to present a smooth, natural effect between the eyelids. Rubber made it possible for them to produce an artificial eye that is said to be comfortable to wear and that moves almost as naturally as its mate.

The first step is to take an accurate cast of the eye socket in plaster of Paris, which the mucous membrane lining the orbit stands very well. From this cast a mold is made, and this is filled with rubber. The difficulty of consistency is solved by making the front of the new eye of hard rubber, vulcanized and enameled to represent the natural appearance, and the back of the eye of soft rubber, hollowed out in the form of a ball, and filled with air.

This artificial eye is thus perfectly elastic, pneumatic, and fits easily the irregularities of the eye socket, responding in a remarkable manner to the ocular movements. It does not irritate the orbit and is not easily broken.

OSTROMYSLENSKI AND HIS SYNTHETIC RUBBER.

"**L**E Caoutchouc & la Gutta-Percha," of November, 1916, announces that it has received from an illustrious collaborator, Dr. Yvan Kondakow, the following communication concerning the synthesis of rubber presented by Ostromyslenski, a translation of which was published in THE INDIA RUBBER WORLD of November 1, 1916.

The synthesis of rubber for special purposes, which has made so much noise, not only in Russia, but also in our friend country, France, presents nothing unforeseen nor remarkable.

Ostromyslenski only isolated a more handy way than the usual methods to obtain, so he affirms, butadiene by the action of acetic aldehyde on ethylitic alcohol in the presence of a catalyzer, such as alumine, at a temperature of 450 degrees C. The butadiene obtained is then purified by known methods and transformed into rubber by heat, in the presence or out of the presence of sodium.

What the value of this method of preparation is; what its cost of production commercially, no one in Russia knows. Despite the enormous expenditures made in his factories, Ostromyslenski has not yet attained any practical result.

One must admit that Ostromyslenski works and above all publishes much work, but his studies are not of a very serious character, for the author is not well acquainted with rubber literature and has a marked tendency to attribute to himself as his own discoveries, things that have been known for a long time.

DR. YVAN KONDAKOW.

THE SITUATION IN FRANCE.

By Our Regular Correspondent.

BUSINESS in rubber goods continues to be brisk, both for the government and private orders, and most manufacturers have now overcome the handicap of labor shortage which was very serious at the beginning of the war, especially for small concerns that had no government orders and could not, therefore, obtain special exemption for their skilled employees.

RAW MATERIALS.

The supply of raw materials, both rubber and compounding ingredients, is satisfactory. Considering the scarcity and the high cost of ocean freight, also the tremendous demand for rubber goods, rubber prices are comparatively low, but chemicals continue to be very expensive.

TIRES.

The chief demand is for pneumatic and solid rubber tires for motor vehicles, but manufacturers of proofed clothing materials, rubber footwear, insulated wire and cable are also doing a lively business.

Considering conditions, the demand for tires for private use is exceedingly good and manufacturers are able to take care of all requirements. Foreign tires have been imported, but these have practically all been for American vehicles requiring sizes not made in France.

The scarcity of leather that has resulted from the war has led our tire manufacturers to discard the studded-leather casings that formerly were so popular here. They have substituted the metal-rubber principle in which the studs are directly anchored in the rubber and fabric of the tire. This is a reversion to an early type of metal-stud tire which in the past was not satisfactory, but is now giving very good service thanks to improved methods of manufacture.

FUTURE SOLID-TIRE TRADE ASSURED.

Our soldiers of to-day will go back to business after the war with the knowledge that motor trucks are far superior to horse-

drawn vehicles for most purposes. As a consequence, the demand for solid rubber tires will be far greater after the war than it was previous to it, and our manufacturers will continue to

A SUPPLY COLUMN IN FRANCE ALL ON RUBBER TIRES

have good use for the modern machinery they have installed to take care of war orders.

THE CABLE INDUSTRY

The shortage and the high cost of coal has been no small source of trouble to all manufacturers in France. Among the measures taken to minimize the ill effects of coal scarcity the most important is the active development of water power—white coal, as we call it. This development is resulting in unprecedented demands for insulated wire and cables; demands that are sure to continue and to grow after the reestablishment of peace. The prospects of our electrical industry are, therefore, very bright. Not only will insulated wire and cables have to be supplied for the total reconstruction and reequipping of the districts now in the enemy's hands, and which are among the richest industrially of the world, but there will be a demand for the development of new electrical power throughout the country.

In districts where water power is unavailable, the gas from coke ovens will be used to drive motors, which in turn will drive dynamos to produce electric current for all purposes.

THE BRUSH INDUSTRY.

Our brush industry has been unfavorably affected by the war. The bristles, which came mainly from Russia, Roumania and Leipzig, have been difficult to obtain, and the markets for the manufactured goods have been curtailed on account of the war and prohibitive prices.

Brush manufacturers here are looking to improved machinery to compensate for the scarcity of labor which will hardly be lessened by the ending of the war. They have also recognized the advantages of setting brush bristles in rubber, and there certainly is an excellent market here for American-made brushes.

RUBBER TUBES SAVE WOUNDED SOLDIERS.

A system of sterilizing wounds, which has been successfully applied in many hospitals here, employs rubber tubes provided with numerous holes through which antiseptic liquids pass to wash out deeply infected wounds. This method of irrigating wounds has reduced amputations by 50 per cent.

THE USE OF PONCHOS.

The square rubber garment, known as a poncho, and long the raincoat of the enlisted man of the United States army, has found equal favor among our soldiers in the trenches. Ponchos are not furnished by our government as part of the regular equipment, but great numbers of them have been supplied by the American LaFayette Fund Society. They are giving full satisfaction and it is not unlikely that they will be officially adopted.

THE RUBBER INDUSTRY IN SPAIN.

By a Special Correspondent.

THE paralyzation of Spain's commercial and industrial life, that immediately followed the outbreak of the war, has gradually passed, and the prosperity now reigning in Barcelona, our greatest commercial and industrial center, was never paralleled in time of peace. This prosperity is due to numerous orders from belligerent countries and to the fact that our manufacturers have no longer to suffer from foreign competition, which was very bitter before the war.

THE RUBBER INDUSTRY.

Our rubber industry has its full share of the general prosperity. Prior to the war, Spain was not producing more than 50 per cent of her requirements in rubber goods. The balance was imported from France, Germany, Austria-Hungary, Italy, England and the United States, and consisted chiefly in pneumatic tires for automobiles.

Within the past two years our rubber industry has grown so rapidly that it is able now to supply practically all domestic demands and to engage in an export trade which, during the past fiscal year, amounted to more than \$1,000,000. Prior to the war our rubber manufacturers exported a few articles to Latin

BARCELONA FACTORY OF PIRELLI & CO.

America, the Canary Islands and the Near East, but their foreign business had none of the importance it now has.

Our rubber industry is centered in and around Barcelona. There are concerns in other cities, but not large enough to deserve mention here. The following are the most important rubber factories in the Barcelona district:

- J. Anto, Arcjos, Agustin, 7.
- F. Capella, Pelayo, 34.
- M. Estobanell, Boqueria, 32.
- M. Ferrer Marcet, Union, 3.
- P. Garriga Escarpanter, Rbla. Sta. Mónica, 12.
- J. Gassó y Marti, Ancha, 31.
- M. Gisbert y Compañía, Paseo Colon, 6.
- Hutchinson, S. A., Rambla Cataluña, 64.
- G. Klein, Princesa, 61.
- Lacelle y Compañía, Universidad, 23.
- S. Llach, S. Pablo, 91.
- Viuda de Mno. Marcet, Pza. Teatro, 6.
- Matas y Compañía, Princesa, 6.
- Magpin Papiol, Pelayo, 58.
- Pirelli & Co., Villaneuva y Geltru.
- Ribase Iter, Trafalgar, 5.
- J. Ribera, Puertaferri, 25.
- J. Rosich, Urgel, 160.
- Luis Ferrer, Fernando, 16.
- Viuda de J. Sabater, Tallers, 6.
- Tusell Hermanos, Fontanella, 20.
- Pablo Fornt, Duquo Tetuan, 25.

VARIETY OF MANUFACTURES.

Spanish manufacturers are producing all kinds of rubber articles including mechanical goods, solid and pneumatic tires, druggists' sundries, toys, toilet articles, insulated wires and cables, cut sheet and molded goods of both hard and soft rubber.

TIRES.

Automobile tires furnish what is probably the largest single item of our rubber trade. Our tire market was formerly supplied by imports from France, Germany, England, Austria-Hungary, Italy and the United States. Now the United States and the domestic industry are getting the bulk of the tire business, though France and England continue to supply small quantities of both solids and pneumatics to their Spanish customers.

CRUDE RUBBER.

Seventy-five per cent of the crude and washed rubber consumed by our rubber factories is purchased in British markets. The balance comes from Portugal, France, Brazil, Colombia, Mexico and Africa. Prior to the war we imported small quantities of crude rubber from Germany and Belgium.

CHEMICALS.

The Spanish chemical industry also is centered around Barcelona. No other branch of our industries felt so keenly the effect of the war at the outset and no other industry has been more benefited by the war.

Prior to August 1914, our rubber manufacturers obtained their chemicals and compounding ingredients from England, Germany and France. Now the domestic industry is supplying much of the demand, but we continue to import such compounding ingredients as golden sulphuret of antimony, zinc oxide, rubber substitute and reclaimed rubber from England, the United States and France.

THE RUBBER TRADE IN JAPAN.

By a Special Correspondent.

IMPORTS OF RUBBER SHOES AND OTHER RUBBER GOODS.

ON account of the war, the Japanese importation of rubber goods from the United States has increased, especially that of rubber shoes and electric tape. A few years ago it was estimated that Great Britain was leading in the exportation of rubber goods to the Orient, but during the last two years Japanese dealers have been supplied almost entirely by the United States. Below are the statistics for 1914 and 1915.

	1914.	1915 (to Mar. 1, 1916).
Rubber boots	4,434 pairs	5,960 pairs
Overshoes	20,811 pairs	22,943 pairs
Electric tape	23,045 pounds	42,399 pounds

The tendency is toward reduced imports this year, as the Japanese manufacturers are doing more skilful work, and are almost equaling American goods in quality.

INCREASED SHIPPING FACILITIES.

The matter of much needed steamship facilities is being solved in a measure by Japan, who has girdled the globe in her bid for foreign trade. She has extended her steamship lines, subsidized by the government, to every great port of call in the world, and is taking steps to retain after the war as much as possible of the great trade she has built up with Russia, China and South America. Russia has recently become Japan's best customer and is buying everything from munitions to boots and shoes. In the month of August alone Japan exported goods to Russia to the value of \$5,343,600. In China she will probably out rival all other countries. For the first nine months of the year her total exports to China were \$60,751,721, an increase of \$16,156,448 over the corresponding period a year ago, and during the last ten days of September reached \$2,446,309. With South

America, too, her trade has nearly doubled, amounting to \$1,036,660 in markets she hardly knew existed previously. Trade with Australia has also been growing amazingly. Japan's largest steamship company, the Nippon Yusen Kaisha, a firm in which the imperial family owns a great part of the stock, has just added two more vessels to its lines to the Antipodes, making a total of 10 Japanese vessels which are now plying between this nation and Australian ports. The Pacific Mail Steamship Co. is also increasing its facilities for trade between America and Japan, and this no doubt will be encouraged still further by the recently inaugurated Marconi trans-Pacific wireless service.

ORGANIZED LABOR MAKING PROGRESS IN JAPAN.

Japanese labor, always an interesting matter to Americans, is responding to the propaganda for western methods. Both male and female workers in Japan are taking up the organized labor movement with vigor, according to Bunji Suzuki, president of the Laborers' Friendly Society of Japan. At the recent convention of the American Federation of Labor he stated that the membership of the society had increased from 10,000 to 30,000 during the last eight months. Japanese laborers on the Pacific Coast, he said, are realizing American ideals and adopting American standards of living, and the influence is gradually affecting conditions in Japan also.

THE TAHAI RUBBER CO.

The Tahai Rubber Co. was organized as a stock company, but the charter members bought up all the stock before it was placed on the market. After purchasing the Kobe Rubber factory, the Standard Rubber factory, and seeking a site for another factory, headquarters were established at Kobe. Thus far activities have been confined to repairs and putting in new machinery. The company will manufacture any sort of rubber goods most needed in the market. The officers are as follows: Busuke Nishizawa, president; Shuhei Osaki, Ryosuke Nishioka, Zeno Tanakamaru, Yeisuke Yamazaki, Shimokuro Yamamoto, directors.

JAPANESE PLANTATIONS IN THE SOUTH SEA ISLANDS.

How Japanese rubber plantations will be affected after the war, it is impossible to foretell. These plantations are practically new, and, on account of the European war, rubber prices have remained so low that there has been little or no profit in them. Some of them, however, paid 15 or 20 per cent on their common stock and, generally speaking, the rubber business has been better than any other. The only difficulty has been that there was some speculation in order to make more profit than is generally expected.

Already the people have acquired a great deal of practical knowledge regarding the rubber business, and they are paving the way to establish well organized plantations. The Japanese Rubber Men's Association has given out the following statistics:

Land owned by Japanese	63,531
Cultivated by Japanese	39,886
Planted by Japanese	35,186

These figures do not include the holdings of those not members of the association, and for this reason the totals must be much greater. It is estimated that \$15,000,000 has been expended in this section, which has not yet been tapped very much, for the plantations were not started before 1906, and so have not gained sufficient maturity to make it worth while. Probably by next year a great deal of latex can be taken from these new trees, as they will be just ready for the tapping season. For this reason it would be fortunate for Japanese growers if the war should end this year. They would be just in time to help supply the increased demand which peace would bring.

Thus far the Japanese have not lost anything on account of low rubber prices due to the war. While others have been facing difficulties, and changing their plans, our growers have been cultivating and making their new plantations ready for the time when peace will bring increased activity in the rubber

market. The war is sure to be over within three years, and by that time all of the young trees of this section will be producing their full amount of latex, insuring four or five thousand tons of crude rubber annually—enough in itself to supply all of the Japanese manufactories.

NEW PATENTS.

NISHIMURA RUBBER REPRODUCER.

THE Oriental Rubber Co., of Tokio, has secured a patent for this device which is made of common rubber, and is used to reproduce any print in black or color from paper or other material. Papers are laid on a bench and pressed by the reproducer. A little heat is needed for the process, and at the end the papers are washed clean by a chemical solution.

RUBBERIZED WOVEN BELTS.

The Band and Belt Co., of Kobe, have rights in this invention. Twisted threads are woven together and then coated on both sides with a rubber fluid. The belts thus formed are cheap and strong, and give more satisfaction than those made of leather.

AUTOMATIC INK STAMP.

Toichi Watanake, of Tokio, is the inventor of this stamp. No ink has to be used except to keep the machine well filled.

CELLULOID POLISHER.

This is the invention of Teisuke Koyama. It is used to polish anything made of celluloid, and is generally considered better than cloth polishers. If all moisture is excluded in the making, the polisher is very durable.

THE BALATA INDUSTRY IN DUTCH GUIANA.

THE 1916 balata crop has been reaped and prospecting operations for next year's production are in full swing. A fair amount of money has been made this year, and had the European war not closed the most lucrative markets the returns would have been highly satisfactory.

The 1915 crop, however, was fairly good and had conditions been normal the balata industry in Dutch Guiana would now be in a flourishing condition. This statement is borne out by the report of the Balata Co., Surinam, extracts from which follow:

During 1915 the business has presented many difficulties, some of which were hard to face. We do not say these difficulties were connected with the new ordinance, under which for the first time the operations were carried out—in fact, this exploitation took place on too small a scale for the observation of the ordinance to come up to expectations—but the difficulties were the consequence of the belated enactment of the ordinance, so that the granting of concessions by the government also was considerably retarded. The result of this was that a goodly part of the laborers, not being able to afford a long idleness, had to seek other employment elsewhere. When, therefore, the operations were started afresh—some four months later than usual—only a very few men could be obtained.

Weather conditions, with the exception of a too early drought, were favorable, so that operating with only 370 men, a production of 99,608 kilograms [219,596 pounds] was brought in to our stores.

During the year past we could dispose of our balata here, and the stock at Paramaribo was also converted into cash. By these transactions the financial obligations were somewhat ameliorated and a part of the debit balance of advances was neutralized. It is proposed, therefore, to utilize the provisional profit-balance of the year 1915 in addition to the profits on the sales of the products of 1913-14, after deduction of the losses known at the end of those years.

The administration of the Balata Co., Guiana, has been amalgamated with the Balata Co., Surinam, and the exploitation of this concern appears to have given satisfactory results this year. Some delay was experienced, however, the rains not having appeared in the month of April as expected, and for the want of good drinking water, a bowel disorder broke out among the laborers. The last news from our administrator in Surinam

seems to indicate that the production will be satisfactory. Three times as many men are now operating in the bush. There is good reason to believe that the company has passed its worst period and that the future promises well.

According to the profit and loss account, the profits amount to 161,469 florins [\$64,910.54].

The above is but one example; if capital be invested judiciously in balata undertakings and well managed, there is big money to be made, and to the writer's knowledge no well-managed company ever failed. Of course, however, there is a certain amount of risk in all enterprises.

In the Nickerie district a very extensive balata area has just been discovered; it promises to rival any part of the colony so far under exploitation. This district has already enriched a few companies, and there is room for several more.

Up to the end of October reports coming in from the several districts were highly satisfactory; this gives every hope that the 1917 crop will be unprecedented, provided conditions are normal.

EFFECTS OF THE BRITISH BLACKLIST IN BRAZIL.

That Brazilian and Portuguese concerns in Brazil have been benefited by the effects of the British blacklist, is asserted by our South American contemporary, "Wileman's Brazilian Review," which states that, out of 13,751 tons of crude rubber exported from Brazil since the blacklist went into operation, blacklisted firms have shipped only 894 tons, whereas Brazilian and Portuguese concerns have shipped 4,689 tons.

MEXICAN DUTY ON CRUDE RUBBER.

A decree of the Carranza Government, published December 12, 1916, amends article I, section 4 of the revenue law of Mexico and, beginning December 15, 1916, places the export duty on guayule and caucho at \$0.10 per kilogram.

RUBBER TAPPING DURING WINTERING.

The question of the cessation of tapping plantation *Hevea* during the wintering period was brought up at a recent meeting of the Committee of Agricultural Experiments, Kandy, Ceylon. It was pointed out that, according to results obtained from experiments, there was no considerable variation in the amount of starch in the bark and wood from November up to the time of leaf fall in March. When the trees were leafless the amount of starch showed no signs of decreasing. It was deduced from investigations that the period during which plantation *Hevea* should be rested must include the period which extends from the time new leaves start growing to about three weeks after the leaves are fully developed.

Tapping during the wintering period was unprofitable, due to the small yield per tree, but it was not advisable to stop tapping operations, for the cessation of tapping would upset labor forces.

The question ultimately resolved itself as to whether the damage incurred by the trees through tapping in the wintering period was greater than the loss sustained by the disorganization of labor which could not be prevented were tapping operations suspended during the same period. Data on hand was insufficient to decide the question definitely.

RUBBER PLANTATION TRIPLES ITS OUTPUT.

The Brooklands Rubber Co., Limited, owning plantations in Selangor, Federated Malay States, reports profits amounting to £27,725, or \$138,625 for the fiscal year 1915-1916. The directors were able to raise the dividend from 9 to 15 per cent. The cost of production increased, chiefly on account of high freight rates, but the crop increased from 174,050 pounds to 397,007 pounds; 27,000 pounds above the estimate of production announced at the general shareholders' meeting in 1915.

Rubber Planting Notes.

RUBBER CULTIVATION IN SIAM.

HITHERTO most of the crude rubber exported from Siam has been of wild origin, gathered from vines in the jungles of the remote northern districts and carried by pack elephants in Thadua and from there down the Nam-Ta (Vien-Poukha) river to Luang-Prabang in French Indo-China. Some wild rubber also finds its way to Bangkok, capital and chief port of Siam.

With the development of Eastern rubber plantations, and owing to the destructive methods of the native gatherers, the gathering of wild rubber is rapidly on the decline, but Siam is developing rubber cultivation. The first rubber estate in Siam was established about ten years ago by a private syndicate with headquarters in Bangkok. In 1907 the members of this syndicate organized a company registered at Singapore as the Kombok Rubber Co.

The most important rubber plantation in southern Siam, however, is located at Chantaboon and consists of 25,000 trees planted about six years ago, of which 20,000 trees are now ready for tapping. In the Siamese Malay States, also, some attention has been given to rubber cultivation in the districts of Trang and Setul.

It has been impossible to obtain reliable information regarding the output of Siamese rubber plantations. During the last five years the export of crude rubber through the port of Bangkok has been comparatively small. Such shipments are listed by the local customs authorities under the head "Rubber and Rubber Substitutes," the exports under this classification amounting to 142,304 pounds for the fiscal year 1912, value \$18,533; 229,240 pounds for 1913, value \$32,548; 207,025 pounds for 1914, value \$33,431; 125,764 pounds for 1915, value \$15,533, and 187,980 pounds for 1916, value \$11,055.

TAXATION AND BARK RENEWAL.

In an article under this heading our English contemporary, "The India Rubber Journal," states that one good effect must result from the taxes now imposed on the rubber-planting industry. When rubber prices showed a very big profit excessive tapping seemed, in a measure, to be justified, but taxation to-day, however, has become so formidable as to make it inadvisable to continue the policy of tapping to the limit.

AMERICANS IN MALAYA.

The threatened invasion of Malaya by American capital was the subject of a lively discussion at a meeting recently held at Ipoh, Federated Malay States, by the Central Perak Planters' Association. The chairman, Mr. Ferguson, strongly opposed the advent of Americans, and others spoke in the same strain; but there was divergence of opinion as to what action could be taken. One member supported the influx of American capital. Finally it was resolved that "this association is not in favor of large areas being alienated under existing circumstances."

SINGAPORE CRUDE RUBBER TRADE.

That the exports of crude rubber from Singapore to the United States for the first nine months of 1916 were nearly twice as great as the combined exports of the same commodity to Great Britain and Continental Europe, is apparent from a recent report of the American Vice-Consul at that port.

Exports from Singapore to Continental Europe during the first nine months of 1916 decreased in practically all articles except plantation rubber, whereas shipments to Great Britain, in the main, increased. Rubber exports rose in all cases, Europe's

purchases of 3,900 tons during the period in question being 45 times greater than the 1913 figure. Great Britain's increase was from 6,354 tons, in 1913, to 10,914 tons in 1916, and that of the United States from 1,914 tons to 26,913 tons, or about 1,300 per cent.

SOUTH AFRICA PROHIBITS RUBBER EXPORTS.

A recent proclamation of the Government of the Union of South Africa places an embargo on all exports of rubber, gutta percha and balata, crude or manufactured.

NETHERLANDS INDIES RUBBER EXPORTS TO UNITED STATES.

Exports of crude rubber from the Dutch East Indies to the United States during the three months ending September 30, 1916, amounted to 8,745,635 pounds, as compared with 4,631,320 pounds exported during the corresponding period of 1915.

THE SITUATION IN NYASALAND.

The amount of trade and revenue in this British Protectorate during the fiscal year 1916 not only exceeded that of 1915, but showed an increase compared with 1913-14. The crude rubber industry shared in the general prosperity, the exports of plantation rubber alone showing an advance from 33,685 pounds, in 1914-15, to 46,002 pounds in 1915-16.

THE RUBBER INDUSTRY OF THE GOLD COAST.

INTERESTING details respecting the rubber industry in 1915 are given in a report recently issued by the Director of Agriculture of the colony.

HEVEA RUBBER.

During the year the government's agricultural stations distributed 349,450 *Hevea* seeds and 53,305 *Hevea* plants which had been raised in their nurseries; 238 per cent more plants were distributed in 1915 than during the previous year and nearly one-third of them was distributed in the Peki district.

The agricultural stations did not distribute all the *Hevea* seeds produced on their plantations, however, and the undistributed seeds were decorticated and pressed for oil extraction. Exports of crude rubber showed a decrease, the amount being 647,982 pounds against 654,133 pounds in 1914.

TAPPING, SPACING AND OTHER EXPERIMENTS.

Tapping experiments conducted at the various agricultural stations proved the half-herring bone system to be the most economical method of tapping; also that better yields were obtained where the lateral cuts were made on the left-hand side of the tapping channel. Experiments were also conducted to determine the effect of tree spacing upon yield per tapping. These showed that a much higher average yield per tree per tapping is obtained in plots planted 15 by 15 feet as compared with plots where trees of the same age are planted 12 by 12 feet. In the former case the average yield per tree was 44 ounces at each tapping, while in the latter the yield was only 24 ounces. Yields per acre for the two systems of spacing, based on the assumption that each tree was yielding the above average, gave the approximate ratio of 8.7 in favor of the more widely planted trees. *Funtumia* trees previously tapped are annually decreasing in yield, and the cultivation of these trees is being abandoned. Root parasites presented the most serious diseases affecting *Hevea*. Fungoid diseases, though troublesome, in most cases responded to treatment.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED NOVEMBER 14, 1916.

- N**O. 1,457,857. Golf ball marker. J. D. Lyon, assignor to The Fulname Co., both of Cincinnati, Ohio.
 1,24,621. Tool for expanding and contracting tire rims. J. Waldschmidt, Fend du Lac, Wis.
 1,204,636. Rotating heel of flexible rubber. W. G. Anderson, Boston, Mass.
 1,204,650. Hose coupling. C. A. Cladlin, Medford, Mass.
 1,204,688. Wheel comprising a removable tire rim. H. C. Gibson, New York City.
 1,204,863. Anti-skid device. E. P. Hafner and J. T. Roberts, St. Louis, Mo.
 1,204,887. Rubber traction device for pneumatic tires. C. E. La Fleur, Philadelphia, Pa.
 1,204,921. Life preserving suit. Silas D. Will, Fort Payne, Ala.
 1,204,957. Toy rebounder comprising elastic cord. I. R. Dean, Memphis, Tenn.
 1,205,004. Fountain pen. T. Matsui, Wenatchee, Wash.
 1,205,021. Anti-skid device. S. Renner and G. P. Adams, Western, Nebr.

ISSUED NOVEMBER 21, 1916.

- 1,205,161. Tire rim. H. M. Chaney, Sardinia, Ohio.
 1,205,215. Overshoe with an opening at the heel and a surrounding elastic sleeve. F. E. Jousset, New York City.
 1,205,345. Method of producing reinforced, flat vulcanized articles. A. L. Hatfield, Hillside, N. J.
 1,205,410. Injection apparatus comprising rubber tubing. A. C. Tenney, Chicago, Ill.
 1,205,527. Rim for vehicle wheels. C. W. Gressle, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,205,528. Tire supporting rim for vehicle wheels. T. W. Guthrie, assignor to The Standard Welding Co.—both of Cleveland, Ohio.
 1,205,657. Securing resilient tires to vehicle wheels. O. A. Parker, New York City.
 1,205,699. Dress shield. C. D. Bennett, Cresskill, N. J.
 1,205,752. Non-skid chain. J. Kirkwood, Lenox, Mass.
 1,205,847. Fountain pen. C. W. Boman, Brooklyn, N. Y., assignor to Eagle Pencil Co., New York City.
 1,205,849. Tire valve. J. A. Bowden, Los Angeles, Calif., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
 1,205,866. Demountable rim. O. E. Dingley, West Farmington, Me.
 1,205,903. Wheel rim. R. M. Keating, Springfield, Mass.

ISSUED NOVEMBER 28, 1916.

- 1,205,958. Demountable tire rim. G. C. Allison, Canton, Ohio.
 1,205,962. Sponge rubber toe straightener. J. W. Arrowsmith, assignor to The Arrowsmith Manufacturing Co., Inc.—both of Morris-town, N. J.
 1,205,984. Suction and discharge hose. T. A. Forsyth, assignor to Boston Belting Co.—both of Boston, Mass.
 1,205,987. Rubber cap attachment for rubber hose. C. E. Girten and A. M. Bowman, Houston, Tex.
 1,205,990. Sweat band including an elastic band. L. B. Heady, Houston, Tex.
 1,205,995. Tire comprising an outer casing and a plurality of inner metallic rings. E. F. Howard, Ansonia, Ohio.
 1,206,041. Protective covering for ice-bags. A. L. Saltaper, Houston, Tex.
 1,206,047. Bathing cap and method of making same. A. C. Squires, Key-port, N. J., assignor of one-half to D. Basch, New York City.
 1,206,064. Tire tool. M. Waters, New Albany, Ind.
 1,206,070. Elastic trawler belt. J. S. Wohlgenuth, Pittsburgh, Pa.
 1,206,102. Rubber glove having flutes along the backs of the fingers. J. C. Gibson, Akron, Ohio.
 1,206,230. Rubber hose. W. W. Kincaid, Meadville, Pa.
 1,206,306. Packing comprising a rubber core. I. Crane, assignor to Crane Packing Co.—both of Chicago, Ill., a partnership consisting of F. L. Pavre and I. Crane.
 1,206,346. Rubber tread for footwear. A. McTernan, Andover, Mass.
 1,206,386. Inner tube for pneumatic tires. R. C. Sprattling, Opelika, Ala.
 1,206,519. Elastic support for flat feet. A. Dusterwald, Halle-on-the-Saale, Germany.
 1,206,522. Demountable rim. J. G. Fleming, Tarrytown, N. Y.
 1,206,548. Bathing shoe with water-tight foot sole. J. Kimmel, New York City.
 1,206,604. Pneumatic horse collar. L. E. Van Treese, Letts, Ind.
 1,206,630. Tire armor. J. W. Whitsett, Berkeley, Calif.
 1,206,757. Pistol comprising a compressible ball adapted to contain and expel a liquid. R. Parker, New York City, assignor to Parker, Stearns & Co., Brooklyn, N. Y.
 1,206,774. Turn shoe sole. C. C. Burnham, assignor to the B & R Rubber Co.—both of North Brookfield, Mass.
 1,206,780. Method of making turn shoes. C. C. Burnham, assignor to the B & R Rubber Co.—both of North Brookfield, Mass.
 1,206,786. Automobile wheel rim. F. F. Enter, Cuyahoga Falls, Ohio.

ISSUED DECEMBER 5, 1916.

- 1,206,857. Interchangeable rim clamp. J. Kelsey, Detroit, Mich.
 1,206,867. Educational toy balloon. J. Lewis, Brooklyn, N. Y.
 1,206,909. Rubber block tire. F. B. Pfeiffer, Akron, Ohio.
 1,206,932. Cylindrical rubber block tire. C. A. Simmons, Albany, N. Y.
 1,206,948. Pneumatic tire. G. B. Van Wagenen, Alstead Center, N. H.
 1,206,976. Elastic finger support for writing instruments. J. F. Barth, Cleveland, Ohio.
 1,206,983. Separator for storage batteries. W. L. Bliss, assignor to U. S. Light & Heat Corporation—both of Niagara Falls, N. Y.
 1,206,990. Resilient tire for vehicle wheels. C. C. Collins, South Lebanon, Ohio, assignor to The Superior Tire & Rubber Co., Augusta, Me.
 1,207,120. Nipple and comforter for infants. H. H. Younker, New York City.
 1,207,121. Reservoir shaving brush. F. W. Zeidler, Jersey City, N. J.
 1,207,185. Spring tire with rubber tread. F. Lotter, Elkton, Mich.
 1,207,277. Rim for pneumatic tires. W. E. Copithorn, Natick, Mass.
 1,207,287. Storage battery comprising a rubber jar. B. Ford, Philadelphia, Pa.
 1,207,317. Fountain pen casing. F. W. Olive, assignor to J. Lipic—both of St. Louis, Mo.
 1,207,377. Cover for nursing bottle. W. M. Decker, Buffalo, N. Y.
 1,207,408. Dust cap for air valves for auto tires. A. J. Ingersoll, Bridgeton, N. J.
 1,207,427. Pump for pneumatic tires, comprising a block of resilient material interposed between the inner tube and its casing. H. F. Molkenbur, St. Paul, Minn.
 1,207,440. Automobile cap comprising an elastic band. F. Raudnitz, New York City.
 1,207,594. Pneumatic tire protector. E. E. Miller, Lewisburg, Pa.

ISSUED DECEMBER 12, 1916.

- 1,207,813. Method for preserving tennis balls or other objects containing fluid under pressure. F. W. Stockton, Chicago, Ill.
 1,207,814. Method for preserving tennis balls or other objects containing fluid under pressure. F. W. Stockton, Chicago, Ill.
 1,207,852. Confectionery mold comprising compressible elastic material. R. C. Burger, Toronto, Ontario, Canada.
 1,207,882. Tire valve. C. J. Dorff, Chicago, Ill.
 1,207,894. Self-sustaining resilient liner for wheel tires. C. F. Geyer, Akron, Ohio.
 1,207,927. Wheel rim. R. M. Keating, Springfield, Mass.
 1,207,975. Rim construction. H. Mills, Philadelphia, Pa.
 1,208,006. Life raft comprising a flexible inflatable mattress. J. Rembiszewski and E. Grodzki, Worcester, Mass.
 1,208,064. Cleaning device having a friction face of unvulcanized crêpe rubber. L. J. Wilber, Brockton, Mass.
 1,208,122. Rim for automobile wheels. L. G. Fleming, Tarrytown, N. Y.
 1,208,139. Apparatus for improving the contour and condition of the chin and throat. F. N. Graham, New York City.
 1,208,149. Detachable sand-tread for tires. W. G. Haning, Riverside, Calif.
 1,208,158. Game device employing elastic cord. C. S. Hill, Belmont, Mass.
 1,208,198. Bathing suit having an inflatable lining. S. Penksa, Glen White, W. Va.
 1,208,209. Laminated leather and rubber fabric for shoe soles and the like. J. D. Prince, Boston, Mass.
 1,208,222. Demountable rim construction. R. W. Skillin, Oak Park, Ill.
 1,208,232. Inflatable bag safety device for swimmers and like uses. F. W. Taylor, Cicero, Ill.
 1,208,605. Packing. C. I. F. Mastin, Midland Park, N. J., assignor to S. Dickson, New York City.
 1,208,615. Dipped rubber hot water bottle and method of making. H. F. Mitzel, assignor of one-half to W. M. Rose, Hyde Park—both of Boston, Mass.
 1,208,653. Fountain pen. K. Ruchle, Hennef, and A. Koehler, Kolmar, assignors to Firm Klio-Werk, Fabrik für Gebrauchsgegenstände, G. M. B. H., Hennef—both in Germany.

REISSUES.

- 14,231. Watch holding and attaching rubber device. S. G. Lewis, Greensburg, assignor of one-half to G. W. Daum, Jeannette—both in Pennsylvania.
 14,232. Elastic support for time pieces. S. G. Lewis, Greensburg, assignor of one-half to G. W. Daum, Jeannette—both in Pennsylvania.

THE DOMINION OF CANADA.

ISSUED SEPTEMBER 30, 1916.

- 171,751. Rubber cover for tooth brushes. T. R. Plank, Los Angeles, Calif.
 171,780. Collapsible pail. The Gutta Percha & Rubber Limited, assignee of W. Seward—both of Toronto, Ontario, Canada.
 171,805. Eraser. E. M. O'Herron, Pittsburgh, Pa., assignee of J. A. Coyle, Baltimore, Md.
 171,821. Rubber impregnated storage battery separator. T. A. Willard, Cleveland, Ohio.

- 171,823. Case for nursing bottle. L. C. Butler, New York City.
 171,851. Teat cup for milking machine. H. R. Jenkins, Eltham, Taranaki, New Zealand.
 171,890. Necktie with rubber lining. W. A. McWatty, Duluth, Minn.
 171,996. A bowling pin the body consisting of hard vulcanized rubber and fibrous material. The Brunswick-Balke-Collender Co., Chicago, Ill., assignee of M. J. Whelan, Muskegon, Mich.
 172,076. Bath mat. E. L. Livingston, West Orange, N. J.
 172,096. Pedal pad. G. H. Rives, New York City.

THE UNITED KINGDOM.

PATENT SPECIFICATIONS PUBLISHED.

In order to give the public the advantage of having abridgements of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 are given new numbers when their complete specifications are accepted, or become open to public inspection before acceptance. The new numbers start with No. 100,001 (without any indication of date), and supersede the original application numbers in all proceedings after acceptance of the complete specifications.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 8, 1916.]

- 10,363 (1915). Soft rubber suction disk for suction dentures. N. Cohen, Lowland Villa, Wellington street, and F. Bowerman, 216 County Road—both in Swindon.
 10,457 (1915). Non-skid device for twin tires. S. B. D. Morgan, 15 Roland Gardens, South Kensington, London.
 10,481 (1915). Floats for hydro-aeroplanes comprising inflatable air chambers and a pneumatic tire. J. Schweitzer et Cie, Seine, France.
 10,559 (1915). A renewable tread for tire covers. J. Yates, 13 Joseph street, Sutton, St. Helens, Lancashire.
 10,569 (1915). Inflatable pontoon, etc. A. E. Jones, 37 Liddon Terrace, Leeds, Yorkshire.
 10,574 (1915). Vehicle wheel comprising an outer rigid rim carrying a sectional rubber tread. J. Slee, Moss House, Wargrave Old Road, Newton-le-Willows, Lancashire.
 10,593 (1915). Non-skid tread band for wheel tires. M. G. Cervello, Caxton House, Westminster, and R. H. Neal, 8 Fielding Terrace, Ealing Common, London.
 10,657 (1915). Dress shield. T. McKenna, 31 Basinghall street, London.
 10,688 (1915). Disks and washers made of coir yarn fabric impregnated with rubber, balata, etc. G. D. Rose, 14 Albert Park Road, Lower Broughton, Salford, Manchester.
 101,461. Rubber cylinder for hat finishing apparatus. W. E. Turner, Ashton Road, and R. Lowe, 25 Goole street—both in Denton, near Manchester.
 101,465. Rubber stair treads. G. Anderson, and Leyland & Birmingham Rubber Co., 24 Duke street, Aldgate, London.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 15, 1916.]

- 10,772 (1915). A new typewriter platen roller with rubber sleeve between the core and outer sheath. Underwood Typewriter Co., 30 Vesey street, New York City, and J. J. Cooper, 120 Queen street, London.
 10,773 (1915). Heel with rubber tread. L. Clarke, 207a Brompton Road, London.
 10,880 (1915). Securing loops of fabric or leather to rubber cord. W. P. Dando, 126 Highbury New Park, London.
 11,064 (1915). Doll whose limbs are retained in their sockets by elastic cords. F. Wilkins, 23 Grove Road, Wallasey, Cheshire.
 101,516. Tire tool. C. Goodijn, 16 Nicolaes, Witsenstraat, Amsterdam, Holland.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, NOVEMBER 22, 1916.]

- 11,070 (1915). Hollow tire with metal embedded reinforcing ring. E. B. Killen, 27 Queen Victoria street, and Commercial Tyre Co., 22 Albert Embankment—both in London.
 11,100 (1915). Tire valves. E. A. Hilding, Lidköping, Sweden.
 11,165 (1915). Rubber tire for casters and rollers. A. B. Williams, Weaman street, Birmingham.
 11,170 (1915). Wheel tire composed of alternate blocks of hard and soft rubber. J. Elias, 96 Regent Road, Salford, Lancashire.
 11,239 (1915). Rubber casing for hand grenade and the like. J. Gray, 9 Albert Drive, Crosshill, Glasgow.
 11,246 (1915). Vaccine syringe with rubber cap. W. H. Furness, National Park, N. J., U. S. A.
 11,299 (1915). Rim attachment for block tires. W. T. G. Ellis, 15 Cambridge street, Glasgow.
 11,306 (1915). Rubber studs for hat finishing apparatus. W. E. Turner, Ashton Road, and R. Lowe, 25 Goole street—both in Denton, near Manchester.
 11,329 (1915). Arch support with elastic band. J. Batten, 63 Ridge Road, Letchworth, Hertfordshire.
 11,339 (1915). Elastic cord device for securing paper to drawing boards. A. P. Wright, and H. E. Wright, 37 Funnival street, Holborn, London.
 11,387 (1915). Rubber toe spreaders. P. G. H. Hinder, Oxford House, Oxford street, London.
 11,388 (1915). Foot arch supports with rubber studs. P. G. H. Hinder, Oxford House, Oxford street, London.
 101,526. Rubber wiper for motor or tram-car windows. M. L. Morton, 1226 Murray Hill avenue, Pittsburgh, Pa., U. S. A.
 101,529. Rubber watch holders. S. G. Lewis, Greensburg, Pa., U. S. A.
 101,536. Rubber coated rollers in machine for making artificial leather, fur, etc. T. Schmid, and J. Foltzer, Horn, Switzerland.

- 49,953. Tire tread. Term 14 years. Patented November 28, 1916. W. R. Denman, Akron, Ohio.
- 49,958. Tire. Term 3½ years. Patented November 28, 1916. O. W. Dunham and F. W. Willis, Toronto, Ontario, Canada.
- 49,969. Tread band for pneumatic tires. Term 14 years. Patented November 28, 1916. V. A. Parker, Akron, Ohio, assignor to The B. F. Goodrich Co., New York City.

Review of the Crude Rubber Market.

Copyright, 1917.

NEW YORK.

PLANTATION rubber has been in good demand, particularly during the first two weeks of December, when heavy buying was indulged in by the larger manufacturing interests. Para sorts and Centrals moved freely in sympathy with the buying activity that was evidently in anticipation of the approaching holiday season. Prices had fluctuated considerably in the interim and gains were recorded in the entire list, with plantation leading the list. On December 14, first latex, spot, was 78 cents, an advance of 5 cents since the first of the month, and Upriver fine, spot, was 80 cents, an advance of about one cent since December 1. Africans and Centrals were in good demand and recorded substantial gains in prices. The last two weeks of the month were comparatively quiet, with trading confined to dealers and the usual routine business of small manufacturers. Inquiries were mostly confined to futures, and very little interest was shown in spot quotations. The dullness of the market was seasonable and therefore prices on all descriptions developed an easier tone during the closing week. On December 27, First latex, spot, was 76 cents, and Upriver fine, spot, 79 cents.

The S.S. "Tempaisan Maru" cleared from Seattle, Washington, for Vladivostok on December 17, with 1,111 tons of Brazilian Para rubber. This verifies to some extent the buying for Russian account that was reported in these columns November 1.

LONDON.

The forward movement that featured the December market was confined to plantations, as Paras failed to advance accordingly. The sharp advance in price was followed by heavy forward sales that apparently checked the buying movement. It was generally conceded that the submarine menace influenced the rising market strongly by showing the necessity of providing against possible curtailment of supplies. However, there are ample supplies in sight, which would normally check the advancing market were it not for the imminent shortage of tonnage that will promptly be reflected in the price of crude rubber. London imports for November were 6,118 tons, against 3,835 tons for October. Liverpool imports for November were 1,192 tons, against 1,143 tons for October. The reexports for November were as follows: London, 4,656 tons; Liverpool, 951 tons.

SINGAPORE.

There was a good demand for standard-grades at the auction held November 2, Pale crêpe and Ribbed smoked sheet bringing 59 cents and 58.6 cents, respectively. Of 628 tons offered, 452 tons were sold. The following week 770 tons were cataloged, and 454 tons sold in a strong market at advanced prices for the leading grades of about 3 cents a pound. On November 17 a record quantity of 948 tons were cataloged, but only 385 tons were sold, resulting in easier prices. Pale crêpe sold up to 62 cents, and Ribbed smoked sheet realized 59.5 cents. The average price for Plain smoked sheet was 54.8 cents.

The result of the auctions held December 1, 8, 15 and 21 was as follows: Pale crêpe averaged 65.4 cents and Smoked sheet 64.5 cents. The amount sold was 1,350 tons as compared with 1,827 tons a month ago.

BATAVIA.

The demand for spot rubber at the auction September 22 was good and prices advanced. Many holders took advantage of this and sold heavily before the auction. There were 12,835 pounds offered and 11,000 pounds sold. The auction of September 29 brought out 24,543 pounds of which 11,802 pounds were sold at advanced prices.

NEW YORK QUOTATIONS.

Following are the quotations at New York one year ago, one month ago, and December 29, the current date:

COMPARATIVE NEW YORK PRICES FOR DECEMBER.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows:

"The market for commercial paper has remained fairly steady through December, though with a slight stiffening in rates and some falling off in demand, especially from New York City banks. The best rubber names have continued selling at 4@4½ per cent, and those not so well known 5@5½ per cent."

MARKET CABLE SERVICE FROM LONDON.

The following market report has been cabled from Aldens' Successors, Limited, London:

Date.	Standard Crêpe.	Smoked Sheet.	Market.
November 27	67.2	67.2	There were buyers.
December 4	71.2	71.2	There were buyers.
December 11	80.70	80.70	There were buyers.
December 18	68.82	68.82	There were buyers.

MARKET CABLE SERVICE FROM SINGAPORE.

The following reports of the weekly auctions held at Singapore have been cabled by The Waterhouse Co., Limited:

Date.	Crêpe Price per lb.	Smoked Sheet Price per lb.	Pounds Sold.	Market.
December 1	66.3	63.3	1,093,120	Closed dull with less inquiry.
December 8	65.8	66.3	1,312,640	Good demand for all descriptions.
December 15	70.1	69.2	244,160	Very depressed; prices nominal.
December 21	59.5	59.5	374,080	Flat; there is scarcely any demand.

SINGAPORE.

GUTHRIE & CO., LIMITED, Singapore, report [November 9, 1916]: The quantity sold at this week's auction amounted to 450 tons out of 738 tons offered. There was a good demand yesterday, but on the continuation this morning it fell away somewhat and closes quiet. The only grade to show any change from yesterday was fine pale crêpe, one attractive parcel fetching \$147 per picul. Standard sheet sold up to \$145 and at this figure is \$7 higher on the week. Plain smoked sheet and unsmoked sheet were wanted, selling up to \$136 and \$134 respectively. The lower grades show an average increase of \$5 per picul. Scraps were neglected. The following was the course of values:

	In Singapore per picul.*	Sterling equivalent per pound in London.	Equivalent per pound in cents.†
Sheet, fine ribbed smoked....	\$139@145	2/8 3/4 @ 2/10	64.94 @ 67.40
Sheet, good ribbed smoked....	134@140	2/7 5/8 @ 2/ 8 7/8	62.71 @ 65.16

EXPORTS OF CEYLON GROWN RUBBER.

(From January 1 to November 13, 1915 and 1916. Compiled by the Ceylon Chamber of Commerce.)

To—	1915.	1916.
United States	14,827,488	23,182,974
Canada and Newfoundland	384,940	6,720
France	497,892	1,501,037
Russia	332,200	248,874
Italy	118,270
United Kingdom	21,005,124	18,666,268
Australia	725,017	769,701
India	1,000	1,358
Straits Settlements	119,933	43,680
Japan	260,421	301,589
Totals	38,154,915	44,840,561

(Same period 1914, 30,339,695 pounds; same period 1913, 21,990,065.) The export figures of rubber, given in the above table for 1914, include the imports re-exported. (These amount to 2,614,208 pounds from the Straits Settlements and 691,243 pounds from India.) To arrive at the total quantity of Ceylon rubber exported for that year deduct these imports from the total exports. The figures for 1915 and 1916 are for Ceylon rubber only.

FEDERATED MALAY STATES RUBBER EXPORTS.

An official cablegram from Kuala Lumpur gives the figures of the export of plantation rubber from the Federated Malay States during the month of November as 6,776 tons, against 5,968 tons in October last and 4,636 tons in the corresponding period last year. This gives a total of 57,046 tons for eleven months of the current year against 39,413 tons in 1915 and 27,336 tons in 1914. Appended are the comparative figures:

	1914.	1915.	1916.
January	1,542	3,473	4,471
February	2,364	3,411	5,207
March	2,418	3,418	4,429
April	2,151	2,777	3,914
May	2,069	2,708	3,956
June	2,306	3,403	5,114
July	2,971	3,687	5,053
August	1,850	3,796	5,782
September	2,879	3,984	6,376
October	2,897	4,120	5,968
November	2,889	4,636	6,776
Totals	27,336	39,413	57,046

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official cablegram from Singapore states that the export of plantation rubber from Straits Settlements ports in the month of October amounted to 5,233 tons. This establishes a new record, the previous best being 5,106 tons in July. The export in September was 2,987 tons and in October, 1915, 2,641 tons. The total export for ten months of the present year is 40,184 tons as against 27,594 tons for the corresponding period last year and 15,023 tons in 1914. Appended are the comparative statistics:

	1914.	1915.	1916.
January	1,181	2,576	4,443
February	1,703	2,741	3,359
March	1,285	2,477	4,481
April	1,548	1,978	4,219
May	1,309	3,588	3,274
June	1,480	2,249	3,836
July	1,584	2,324	5,106
August	1,325	2,295	3,246
September	1,602	4,725	2,987
October	2,006	2,641	5,233
Totals	15,023	27,594	40,184

These figures include transshipments of rubber from various places in the neighborhood of the Straits Settlements such as Borneo, Java, Sumatra and the non-Federated Malay States but do not include rubber exports from the Federated Malay States.

THE MARKET FOR RUBBER SCRAP.

Copyright, 1917.

NEW YORK.

WHATEVER strength developed in the rubber scrap market early in the month was due, no doubt, to the firm position of crude rubber, which had advanced strongly. This has to a certain extent supported the scrap market, which has been generally firm throughout the month with prices ruling about the same as those quoted a month ago. About the middle of the month rumors of peace resulted in cautious trading that featured the market until the inevitable quiet of the holiday season prevailed. The many railroad embargoes have, moreover, adversely affected trading at this time and caused more or less difficulties in shipping and receiving stocks. There was an easier tendency noticed during the last week of the month and lower values seemed imminent, but the volume of business done was insufficient to affect the level of prices.

BOOTS AND SHOES. There has been some business done at 10 cents delivered, but 10½ cents was the accepted dealers' price for 50-ton lots. It is evident that supplies are not accumulating to such an extent as to be burdensome. Trimmed and untrimmed arctics have moved freely, the former bringing as high as 7½ cents and the latter 6½ to 6¼ cents in a firm market.

AUTO TIRES. Tires have been offered rather freely. Mixed tires were fairly firm, but not very interesting to the mills at 7 cents, although this price may have been shaded in some instances. The special grades of white G. & G. tires were dull and featureless at 8½ cents. Bicycle and solid tires were in good demand at firm prices, ranging from 4¾ to 5 cents for the former and 5½ to 5¾ cents for the latter.

INNER TUBES. The demand has been good at prices slightly in advance of those quoted a month ago. Sales of No. 1 tubes have been made to the mills at 26 to 26½ cents delivered. No. 2 and red tubes have been firm at 11½ cents.

MECHANICALS. Business in all grades has been very quiet and confined to small lots. Hose, however, has received some attention and has been fairly firm in price, the large grade bringing 1½ cents. Air-brake hose had a limited call at 5¾ cents delivered.

London imports of waste and reclaimed rubber for November were 109,300 pounds; Liverpool, 20,100 pounds. Exports from London were 1,244,000 pounds; from Liverpool, 106,800 pounds.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1917.

NEW YORK.

THE American cotton market has experienced violent fluctuations and extraordinary price changes in the month just past. Liquidation has been very heavy. From 20 cents, the New York spot price on December 1, cotton declined to 16½ cents by the 23d of the month. March contracts sold at 16.22 on December 21, representing a decline of \$25.50 per bale from the high prices recorded late in November. Possibility of the crop forecast being underestimated, general optimism in regards to peace prospects and confidence in future consumption had a restraining influence on the market, which later in the month became stronger. Unsettled conditions still prevail and caution appears to be dominating the present situation.

EGYPTIAN COTTON. Sudden and violent fluctuations have characterized the Alexandria market during December. Sakellarides sold for 47 cents, with the other grades in the list comparatively high. That stocks are being held in anticipation of further advances is generally conceded. Crop estimates are said to be too optimistic in view of the short acreage and dangers that threaten the growing plant.

SEA ISLAND COTTON. The active demand in evidence at Savannah early in the month absorbed all the round lots offered at 52 cents. The market continued quiet until the middle of the month when considerable inquiry developed and prices that had dropped to 50 cents became firmer. Some small business was done prior to the holidays at prices around 50 cents, and the condition of the market was generally quiet. Holders are not disposed to sell their good grades, but appear willing to make concessions on the inferior sorts. Stocks at Savannah and Charleston, December 1, were 8,653 bales, against 14,875 bales a year ago.

MECHANICAL DUCK. The demand for hose and belting duck continues to be good, and contracts are being made covering the last half of next year. Prices softened somewhat with the decline in the raw material, resulting in a loss of ½ cent a pound in belting duck. The outlook is for higher rather than lower prices, due to the uncertainty of sufficient supplies of raw cotton and the large demand for mechanical duck that comes with the usual industrial activity in the spring.

SHEETINGS, OSNABURGS AND DRILLS. There has been a fair demand for these fabrics and with few exceptions prices have remained about the same as a month ago. A brisk demand from Canada was noted during the month, while European business was very quiet. The decline in raw cotton affected only spot goods for immediate delivery and at prices a little under the market.

TIRE FABRICS. The demand has continued to be good for all grades of fabrics used in tire building. The mills are still sold far ahead and contracts have been made covering the requirements of the trade for next year. In fact, prices have advanced about 5 cents the square yard within a month, and there are no basic reasons for a belief in lower prices under the present market conditions.

NEW YORK QUOTATIONS.

THE MARKET FOR CHEMICALS AND COMPOUND-INGREDIENTS.

Copyright, 1917.

NEW YORK.

THE trade in rubber chemicals and ingredients has been exceedingly active during the month of December. The former conditions that created high ocean rates and insurance and limited cargo space have continued and supplies of raw materials are still difficult to obtain. Domestic producers of both crude and manufactured compounding ingredients are running full capacity to meet the demand. There is no doubt that a great many chemicals formerly imported will be permanently manufactured in this country.

Colors have been rather weak with the exception of Indian red and red oxide, largely due to the small production and the unwillingness of manufacturers to increase their output under prevailing conditions.

ACCELERATORS. Tri-nitro-benzene is not commercially made in this country. Accelerene, a new organic accelerator, is now on the market.

ANILINE OIL. Aniline oil is now sold in a dry powder form and from which the disagreeable fumes have been removed. It is claimed to produce a very tough compound that ages well. Prices have been firm on the standard grades.

ANTIMONY SULPHURET. Considerable interest was shown in the best grades of domestic crimson and golden sulphuret of antimony. American producers appear to be firmly established in the manufacture of this material. Business has been good and

prices unchanged. Contracts have been written covering next year's requirement.

ALUMINUM FLAKE. There has been considerable business done in flake and prices have advanced during the month.

CARBONATE OF MAGNESIA. The export demand has been active, resulting in greatly advanced prices for the standard grades. Domestic producers are well sold ahead.

BARYTES. The demand has been fairly steady with rather quiet conditions prevailing later in the month. Higher prices are expected.

GAS CARBON BLACK. All grades were in demand and prices have advanced in a generally firm market.

LITHARGE. There has been a fair demand for this material which has occupied a firm position during the month due to the strong position of pig lead. Higher prices are predicted.

LITHOPONE. Domestic grades have been in good demand at firm prices that have not changed during the month. Imported grades have been offered at prices subject to previous sale.

OXIDE OF IRON. The bright grades are very scarce and high due to the position of the copper metal.

SHELLAC. This is very high and there is little prospect of relief while uncertain ocean shipments continue.

WHITING. The difficulties attending shipment of the raw material continue. Domestic production of chalk whiting has advanced materially and there are prospects of the situation being considerably relieved thereby.

ZINC OXIDE. Contract prices on French process oxide of zinc have advanced 1½ cents a pound on green, red and white seal since our report of a month ago.

NEW YORK QUOTATIONS.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE RUBBER ASSOCIATION OF AMERICA.**

THE change in the name recommended by the board of directors and unanimously adopted at the annual meeting of The Rubber Club of America, Inc., appears to be well conceived as more accurately descriptive of the present aims and activities of the organization, which have become industrial rather than social. Furthermore, it betokens a keener appreciation on the part of the membership as a whole of that larger mission of practical usefulness which constitutes the principal inheritance of the new Association. The proper solution of the several problems of vital import besetting the American rubber industry demands frank exchange of opinion and hearty coöperation for the common good through the medium of an organized body such as The Rubber Association of America promises to become. Thus it seems to have been the height of good judgment to reëlect as officers for the ensuing year those able men who have been so intimately in touch with the developments of the past twelve-month and hence are

exceptionally well equipped to handle the existing situation.

Our problems and opportunities of the present and near future were ably set forth by the distinguished after-dinner speakers at the Rubber Club banquet, as indicated by extracts published elsewhere in this issue. Devoting themselves exclusively to the commercial aspect of these matters, ex-President Taft, Mr. MacRoberts and Colonel Colt convincingly indicated the needs of the American industry, definitely pointed out the pitfalls to be avoided, and offered sound advice for timely action. The other speaker, Bishop DuMoulin, in an address that will be long remembered, discussed America's ethical opportunities, and the enthusiasm with which his wholesome counsel was received emphasized again the gratifying fact that the rubber industry has ever been a leader in this aspect of all commercial relations.

RUBBER TARIFFS OF THE FUTURE.

IN another column will be found a quotation from the "London Times" that shows the feeling that has been aroused by the American invasion of British markets. The fact that English factories were not able to make the goods because they were busy with war orders, nor the fact that the markets were eager for American goods, (these being oftener available) makes not a particle of difference. Nor is the contention of the writer at all unreasonable. In his place any American manufacturer would voice the same complaint and perhaps not as temperately. It is a good guess, therefore, that once the war is over American goods will be handicapped in English markets. A second guess is that an export tariff will be put upon British-grown rubber. Further, as prediction is the motive of this brief, an import tax upon crude rubber will be assessed by our own needy government. Then, there will doubtless follow a downward revision of the tariff on manufactured rubber goods. All of this is in sight, and some, if not all, sure to come.

THE RUBBER INDUSTRY AND CONSERVATION OF NATURAL RESOURCES.

THE report of the special committee of the Chamber of Commerce of the United States regarding combinations to conserve natural resources, and the favorable result of its referendum to the commercial bodies, announced early in January, touch the rubber industry very nearly, for the recommendation of the National Chamber is bound to carry great weight in Congress. As coal, solvent naphtha and the future supply of our present motor-car fuel are involved, the matter is worthy the serious attention of rubber manufacturers.

Most legislation affecting our natural resources, so long exploited, has made no distinction between those which become exhausted or greatly depleted through utilization, and those which to a degree renew them-

selves every year. It is a natural consequence, therefore, that the former now have a tendency toward extinction. Thus to mitigate this as far as possible, the Chamber committee recommends remedial legislation to permit coöperative agreements, under federal supervision, in those industries which involve primary natural resources, on condition that the agreements in fact tend to conserve the resources, to lessen accidents, and to promote the common good. The plan is to enlarge the powers of the Federal Trade Commission beyond its present function of investigation and authorize it to formulate constructive plans for the promotion and safeguarding of public interest under which an industry may operate alike to the benefit of consumers, workmen, and producers. The committee realizes that these are primarily matters of state law and has in mind only such legislation as would bring natural resources under federal statutes and define the conditions under which they may legally become commercial commodities in interstate commerce.

The quantities of products our natural resources are called upon to furnish have greatly increased during the years which have elapsed since our general legislation dealing with interstate trade was enacted. The production of coal from American mines has increased almost fivefold, while the population has increased less than 70 per cent. During the past quarter of a century the yearly drain upon our sources of petroleum has increased sixfold and more. The commercial utilization of natural gas, which fell off in earlier years, has since increased, reaching \$101,000,000 last year, when 628 billion cubic feet were used.

In October the director of the Bureau of Mines said that we have probably reached the climax of our production of crude oil, adding that the Geological Survey estimates that deposits of petroleum as yet undeveloped will scarcely furnish a supply for more than 30 years. If this estimate be correct, our supplies of natural gas may not last so long.

Something like 40 per cent of the coal in the seam has been said by the director of the Bureau of Mines to be lost as far as beneficial utilization is concerned. Millions of barrels of oil have been wasted by being allowed to flow into the streams, by being mixed with water, or by evaporation. There has been no such waste in any other sort of mining. By passing into the air from uncontrolled gas wells, from oil wells, from giant flambeaus, from leaking pipe lines, and from many other methods of waste, natural gas is said to be sacrificed at a rate of not less than one billion cubic feet a day, and probably very much more.

Can any sagacious manufacturer, whether of rubber or other goods, contemplate these facts without realizing the urgent necessity of intelligent coöperation for the common good between the government and producers of American raw materials?

A MONUMENT TO THE INVENTOR OF THE PNEUMATIC TIRE.

THE recent suggestion of F. C. Millhoff that a monument be erected to the man who invented the pneumatic tire is one not to be lightly forgotten. Indeed, it has much to commend it, for while perhaps less spectacular than wireless telegraphy, the aeroplane, the motion picture and similar epoch-making inventions, the pneumatic tire certainly revolutionized transportation and made the automobile possible. But Mr. Millhoff very aptly says:

The man who invented the first pneumatic tire would certainly be entitled to consider himself one of the greatest contributors to human progress, yet not one person in a million even knows his name, and very few ever wondered who he was. If anybody ever badly needed a monument as a protection against oblivion, he is the man.

When that happy time comes that the world finds itself at peace, the motorists, tire and automobile manufacturers of every civilized country might well join in raising a fund for a suitable memorial to Robert William Thomson, the first patentee of a pneumatic tire in England in 1845. The United States, however, is the center of the tire and automobile industry, and if, meantime, Americans decide to honor this worthy pioneer in a great industry, it is easy to foresee that it will be nip and tuck between Akron and Detroit as the site of the memorial.

WITH THE PASSING OF HENRY A. GOULD THE RUBBER trade loses a striking and interesting figure, a "gentleman of the old school." His gentle dignity and precise courtesy were as much a part of his business as of his social life. While he was an able business man, and a pioneer in large undertakings, his leanings were toward the scholarly arts and the betterment of mankind. To his staff he was ever the respected teacher rather than the "boss." A quaint, picturesque personality, we of the trade shall not see his like again.

ALONG WITH THE PREDICTION THAT FINE LEATHER shoes will soon cost \$30 per pair, comes the announcement that "leatherless" shoes are to be worn throughout the West next summer. Leatherless does not mean rubberless, however.

THE INCREASING DEPENDENCE OF THE United States on the tropics for raw materials and foodstuffs not produced in this country is shown by the fact that more than a billion dollars' worth of tropical products were brought into this country during the fiscal year 1916. The exact total, \$1,060,850,416, represented an increase of \$253,208,231 over the year 1915. Imports of rubber, etc., amounted to \$304,000,000 during the fiscal year 1916, against \$280,000,000 in 1915, and \$109,000,000 in 1905, and were exceeded in value only by sugar, coffee and fibers.

The Rubber Club's Seventeenth Annual Banquet.

WHILE the diners may have talked among themselves of recent achievements and present prosperity, our problems and opportunities after the war formed the chief topic of the distinguished after-dinner speakers at the seventeenth annual banquet of The Rubber Club of America, Inc., which was held in the grand ballroom of the Waldorf-Astoria, New York City, on Monday evening, January 8.

Before the banquet was served the diners gathered in an adjoining room and in the congenial atmosphere of an informal reception greeted their friends and renewed acquaintances.

Upon entering the banquet hall one was immediately impressed by a welcome departure in the decorations. Large American flags predominated and were introduced in the simple and pleasing form of sharp-angled trophy stacks at suitable lo-

Each guest found at his place an attractive program and menu with a cover in lavender, green and gold embodying an attractive design including the Rubber Club seal, a sprig of *Hevea* leaves, the western hemisphere, and a man tapping a rubber tree.

After an invocation by The Right Reverend Frank DuMoulin, Bishop-Coadjutor of the Diocese of Ohio, the diners enjoyed an excellent repast and during the addresses that followed manifested great enthusiasm as the salient points of each speaker were brought forth.

A TOAST TO THE LADIES.

At the conclusion of the dinner President Firestone called attention to the fact that for the first time in its history the Rubber Club enjoyed the honor and pleasure of having ladies present to hear the after-dinner speaking. In proposing a toast to "The Ladies," which was heartily drunk, he expressed the belief that the distinguished guests of honor must realize "that the gentlemen composing the great rubber industry have a distinct appreciation of the refined and the beautiful."

PRESIDENT FIRESTONE'S ADDRESS.

President Firestone then continued with the following address, announcing the birth of The Rubber Association of America and touching briefly upon the Rubber Club's activities of the past year and its growth in membership:

As President of the Rubber Club I am very much interested—and I want every member to feel interested—in both its fraternal and business activities. However, as there are many of our members here tonight who have not attended the annual meeting nor taken an active part in it, I know that you will be much interested in the business activities of the Club. I want to say just a word in regard to the rubber industry and the Rubber Club of America, from now on to be known as The Rubber Association of America.

The reason that your directors have recommended this change in name to the members at the annual meeting was that it better represents the true position of the organization. Originally, the New England rubber men gathered together for social purposes only. Out of these meetings grew the Rubber Club of America, the purpose of which was not only to bring the rubber interests together socially, but to promote the welfare of the rubber industry.

This so changed the nature of the organization that the name Rubber Club became misleading, and as a result we have adopted the title, The Rubber Association of America, which more clearly describes this body.

As our raw materials are received from foreign lands, and many of our products are shipped to foreign countries, there is every reason why the rubber interests must have a strong and efficient organization to look after the interests not only of the rubber industry but the entire commercial activities of the United States, which are so vitally affected by our well-being.

Rubber is the most important commodity in the world. It is not only of great importance commercially, but our happiness and social welfare are to a large degree dependent upon it. You will be surprised to know that the rubber manufacturing industry stands among the first few leaders in volume in dollars and cents.

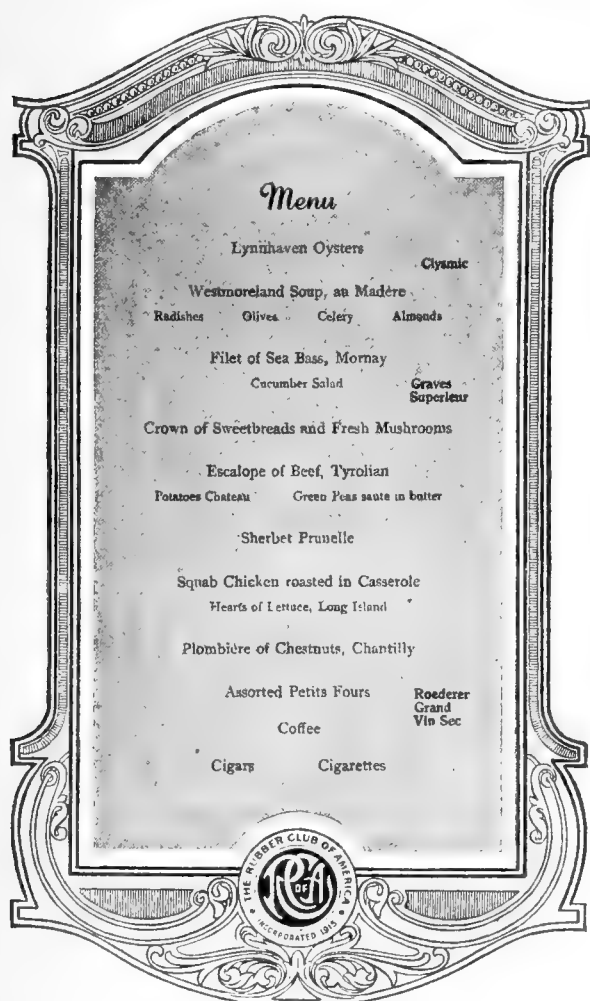

During the past year your Advisory Committee has been very active and held fortnightly meetings effectively dealing with the questions which have been brought before it. The members of this committee have given generously of their time for attendance at these meetings.

A committee on legislation has been closely in touch with measures affecting the industry which have been introduced at Washington. This committee, however, has had comparatively little to do, as no tariff changes have been attempted.

One of the most important efforts of the year was the formation of rules and a uniform contract to govern transactions in crude rubber between importers and dealers and manufacturers.

The committee has submitted a report which was sent to every member and has now been adopted.

An Arbitration Committee to assist in carrying out the rules has been provided for.

cations about the room, producing a tall, narrow effect in harmony with the architectural lines. At the head of the room hung the Rubber Club banner, while the spaces between the trophy stacks and also along the fronts of the two tiers of boxes, occupied by the ladies during the after-dinner speaking, were draped with large flags in a frieze-like effect interspersed with blue banners displaying in true colors the coat of arms of the several states in which the rubber industry flourishes. But the crowning feature consisted of a great American flag, cleverly concealed, which suddenly unfurled to the inspiring strains of the "Star Spangled Banner," and immediately created a happy spirit of patriotic enthusiasm.

SEVENTEENTH ANNUAL BANQUET OF THE RUBBER CLUB OF AMERICA, INC., AT THE WALDORF-ASTORIA, JANUARY 8, 1917.

A Bureau of Statistics was established last May which, it is hoped, will soon be able to distribute accurate information covering the importing of crude rubber and give the members a valuable report concerning the industry in general.

The following divisions are now affiliated with The Rubber Association of America: The Mechanical Rubber Goods Division, The Rubber Sundries Division, The Hard Rubber Manufacturers, The Rubber and Fiber Sole Manufacturers, The Rubber Heel Club of America, The Rubber Reclaimers' Club and The American Rubber Manufacturers' Association of London.

It is hoped that our group organization will be greatly extended in the future and that much benefit will be derived from the closer association of these groups and the open competition bureaus which may be established.

The Committee on National Preparedness has completed its work and will be succeeded by a research committee.

The organization has shown a very satisfactory growth during the past year. On January 1, 1916, we had enrolled 191 firm members and 227 associate members. On January 1, 1917, we had enrolled 231 firm members, an increase of 40, and 235 associate members, an increase of 8—making a total membership of 465. There are still, however, a number of organizations directly interested in the manufacture of rubber goods which are not represented, and it is hoped that there will be an increase in the membership prior to the next annual meeting.

EX-PRESIDENT TAFT ADVOCATES PROTECTION OF OUR INTERESTS ABROAD AND RUBBER GROWING IN AMERICA.

Ex-President Taft, the principal speaker of the evening, manifested a keen insight of the status and needs of the rubber industry gained through four years' residence in the Philippines, where he established a government and made it possible for American capital to grow rubber under the American flag. After reviewing the growth and importance of the rubber industry and referring to the United States as the world's principal rubber consumer, he pointed to the present situation of Germany and the Central Powers as proving that rubber is a military necessity and demonstrating the awkwardness of being without an adequate supply in time of war. Mr. Taft then reviewed the principal sources of crude rubber, touched briefly upon American enterprise in the ownership and maintenance of rubber plantations in the Dutch East Indies and elsewhere, and emphasized the possibilities of the tropical and semi-tropical areas within our national jurisdiction. Our agricultural authorities, he said, should be awake in their researches to investigate the feasibility of raising rubber in Texas and in those regions of the United States which resemble Mexico in climate and physical conditions. Mention of the guayule industry and its interruption by the deplorable conditions of anarchy now existing in Mexico brought him to a consideration of our foreign policy with respect to the protection of Americans carrying on industries abroad, and to quote Chief Justice Marshall of the Supreme Court and Mr. Justice Miller as to the manifest constitutional rights of American citizens, both individually and in bodies constituting corporations. Continuing he said in part:

Of course some injustice done to our people in other countries may not be of sufficient importance to justify our going to war. It must always be a matter of degree in resorting to such extreme measures. But it will be a fatal injury to our American enterprise and to the great usefulness of foreign investments by our citizens if it is to be understood that we will never resort to extreme measures in discharging the constitutional duty of this country towards its citizens when in foreign lands, and in protecting them against the unlawful invasion of lawless foreign government. And you gentlemen, interested as many of you are, in the industry of producing crude rubber in various foreign countries, in some of which the governments are not the most able, are certainly greatly interested in the maintenance of the constitutional protection of our citizens abroad.

But we have tropical countries of our own in which rubber can be raised. Rubber is produced in some quantity in the Philippines. I was greatly interested in the subject when I was connected with the Government of Rhode Island, but unfortunately the policy of Congress, which we as a commission protested against, has very seriously interfered with the development of the industry there. Oppressed as Congress was by the popular fear of the power and monopoly of great corporations in this country, it allowed itself to be frightened into a policy in the Philippines that has worked greatly to the detriment of their

people, to the detriment of this country, and increasing the trade of those islands. The limitation contained in the fundamental act of the Philippines forbidding the acquisition of land by foreign corporations of more than 2,500 acres is an absurdity in a tropical country where sugar, rubber and other tropical products should be encouraged. The risks connected with tropical enterprises of that kind are very great. Everyone who is familiar with their working will appreciate the maxim that in five years of operation you have two bad years, one moderate year, and two good years, and that the destruction of bad years in the tropics is in proportion to the greater violence of natural forces in the tropics than in the temperate zone. The amount of land which ought to be cultivated in the Philippines as compared with the amount that is cultivated is so great that the acquisition of parts of it by great corporations could work no evil at all. It is a mere hobgoblin created by dangers of this country which find no counterpart in a retarded country like the Philippines. We did for 12 or 15 years make great progress in the Philippines in many ways, but we might have made a great deal more progress in helping the people to better industrial conditions had we had the assistance of the capital which was available in the United States, and which adverse legislation kept out of those islands. I am very proud of the work which we did for 15 years in giving them a good

WM. H. TAFT.

government and in bringing about a condition of prosperity there; in giving half of their school population an opportunity for an education; in giving them law and order; in giving them good roads; in giving them a good currency; in giving them a good administration of justice; in giving them good health. But all these things were made possible by the building up by a great civil service guided and strengthened by a body of Americans the like of which I think we have never had in our government before. The present policy in the Philippines has been to drive out of the service of the Philippine Government, all those American civil servants; and we have turned the Islands over to Filipino politicians and to a control that, after the impulse of a good government which they have had shall be exhausted, will result in efficiency and corruption and produce a discontent that will ultimately plague us, responsible as we are for the welfare of the Philippine people. It will create a political situation in which bribery and blackmail will become a feature in every great business projected there. It will make investments of capital less likely and will help neither the people of the Islands nor the business of the country. These are the reasons why the rubber industry has not flourished in the Philippines. I wish it could have been otherwise.

I felicitate the Rubber Club of America on the enterprise that Americans have shown in hunting opportunities for the growth of rubber, and in the increase in the rubber industry. I sincerely hope that it may not be injured by any ill-conceived system of taxation upon crude rubber, which will put our manufacture at a disadvantage with the manufacturers of the world in competition in the sale of rubber goods. I sincerely hope that the utterly illogical process of reducing the duty on manufactured goods and increasing the duty on the raw material entering into them will not be further pursued in our economic policies. The theory that rubber is a luxury is of course not true. When it was proposed to tax automobiles on the theory that they were luxuries, investigation satisfied the proposers that they had grown to be necessities, and with them, of course, the rubber tires that are essential to their use. I hope the lesson which was then learned will be remembered, and that the enormous industry which you represent will be made to pay its taxes in proportion to your profits and your wealth, but not in such an injurious way as to hamper your competition and productive powers to be used not only for your own reasonable and legitimate profit, but for the benefit of the people of the United States.

SAMUEL MACROBERTS ON OUR FUTURE PROBLEMS.

Samuel MacRoberts, vice-president of the National City Bank of New York in charge of all its foreign interests, spoke in the absence of Frank A. Vanderlip because of illness and was introduced by President Firestone as a man to whom the rubber industry is indebted for the establishment of the gold dollar of

the Far East. Mr. MacRoberts pointed out that the problems of the rubber industry are very much the problems of the entire industrial life of the nation. As a result of two years of exceptional plant expansion and prosperity, the outstanding fact of our economical relation to the world is the sudden accumulation by this country of a large additional capital. What this means to our own country and to other nations has not yet crystallized into any definite thought, although various judgments are being hazarded; and whether we agree with any one of them, Mr. MacRoberts believes it plain that the question is not only pregnant with business disaster, but that it has the lure of very great opportunities. Developing this line of thought he sounded a wholesome warning, extracts from which follow:

The fact that the cost of production in this country has steadily risen to unparalleled heights, the unparalleled level of wages, and the resultant high cost of living, all indicates the difficulties that might come to us through this unusual condition. It indicates how easily this situation might be reversed, and this newly acquired wealth drawn away at the close of the war, leaving only the dregs of a discontent and innumerable difficulties of a political and economic nature. Our industry has already expanded, possibly expanded to the limit of our labor market to operate, and if we are to continue to accumulate gold, this labor situation will prevent our investing it in legitimate industrial enterprises. A further accumulation will only result in an expansion of bank credit which we cannot use in our domestic situation.

This is a situation that is recognized by the Scandinavian countries, and is the reason why they have so strenuously discouraged the further importation of gold into their countries. Even if we are ambitious only to hold this gold, we cannot do it unless we can incorporate it promptly into the commercial business of the world.

The optimistic conclusion that New York is to be the financial center of the world, and that the keys of the commerce of the world are already in our hands is clearly untenable, and it is a dangerous tendency for us to drop into the theory that we have become in the natural order of things a great trading nation, and that our economic position is protected and secured for the future. In real fact we bring to the situation of being a great trading nation only one element, that is, this newly acquired wealth—money. Our geographical position is distinctly against it. We are outside of the lines of trade and commerce. We have no shipping facilities. We even seem to ignore the ordinary economic principles that are necessary to found them. We have not a sufficient number of international banks or other machinery for financing a foreign trade. We prohibit the establishment of foreign banks here, which is just as necessary for maintaining a great international trading position as it is for us to establish our branches in foreign lands.

We have few men with any knowledge of foreign trade or international commerce. Our laws have been drafted with a sole eye for a domestic situation and with no regard either for our opportunities or for our necessities abroad. As a nation we have a provincial point of view on all these matters, and until we can develop a settled public opinion which, after all, controls our government, we will have a weak and unstable government to look to for protection.

Now, getting back to the rubber industry, your situation is just the same. You have the same elements in your situation as is in the general industrial life of the country. Where are you going to be to meet your competition when competition is restored, for after all, this great period of prosperity comes directly or indirectly from these abnormal conditions. In international finance the maxim is that the trade follows the loan. Now, with you it is not a question of whether or not you are to make loans, but whether you will make investments in foreign countries to protect your raw materials, to make your supply of raw materials sure, and at a price which is not unequal to that of your competitors abroad. You have exactly the same

problems that the whole country has, and it is to be hoped that the Rubber Association in looking after its own interests will not overlook these problems that apply to the entire country.

COLONEL COLT REVIEWS RUBBER HISTORY.

Introduced by President Firestone as the dean of the rubber industry, a manufacturer who had made American influence felt in foreign countries, and the pioneer whose courage and foresight had brought us nearer the source of supply by leading the way safely and wisely for American capital in the production of plantation rubber, Colonel Samuel P. Colt reviewed the highlights of rubber history in his own genial manner interspersed with much wholesome humor.

COLONEL S. P. COLT.

Placing rubber as the second of the three greatest forces of civilization to-day, the first and third being steel and cement, he reviewed its source, the origin of its name, early experiments in its use, the discovery of vulcanization and the manifold applications made possible thereby. In illustration of the mighty consequences of Goodyear's epoch-making achievement, Mr. Colt pointed to the pneumatic tire which has revolutionized the world. And said he:

I believe if the automobile had been perfected, and the rubber pneumatic tire had been perfected, and the solid tire on the auto truck had been perfected twenty years before any railroad had been built, there would not have been one-half, nor one-quarter, nor perhaps one-tenth of the railroads that there are to-day. But what would we have had in its stead? We would have had the most magnificent roads; we would have gone back to the days of the stage coach magnified, and we would have had the most magnificent roads throughout this country that the world ever knew, surpassing even those of Rome. But the railroad was first, and the railroads are built, and it is going to take time to build the roads, but I say now that the automobile and the automobile truck are going to encroach daily upon the railroads, and for short hauls are going to very largely supersede them, and our roads are going to improve, and you are interested in this great object, Mr. President, of the Lincoln Highway from the Atlantic to the Pacific Coast. I do not believe we can over-estimate to-day the part that rubber is to play in the civilization of the world in the future, and I do not believe that there will be any substitute for the rubber pneumatic tire. I do not know why the Almighty should have given such a product as rubber to the world, but He did, and they have tried to imitate it, they have tried for synthetic rubber, they have tried all things, but there is nothing found to take its place.

Mr. Colt then referred to the high rubber prices prevailing within four years and to the fact that the vision of those who experimented in transplanting the *Hevea* from the banks of the Amazon to the propitious soil and climate of the Far East had developed an inexhaustible supply that is already providing three-fourths of our need at a moderate price. In closing he emphasized the great present need of cooperation in the industry, quoting former Chairman Hurley of the Federal Trade Commission to the effect that cooperation as opposed to ignorant competition is the watchword of the era we are entering—cooperation between employer and employe, among business men, and between business and government.

Mr. Firestone then said:

It is a little late, gentlemen, but you may be interested—with no reflection on the rubber industry, you should be interested in what the next speaker may say to you. In Ohio we not only build factories and prepare presidents for the White House, but we look after the finer sensibilities for this country, while we are here, and for the next world we don't want to take any chances. We are not selfish with that influence—we have

Courtesy of the Co-operative Press.

S. MACROBERTS.

brought a Bishop from Ohio. He is a man who is responsible for my well-being in the paths that I walk, and some other rubber men that I know. Whether he has fulfilled that responsibility it is up to you gentlemen to judge. Before bringing him down here, we didn't take any chances—I spent my vacation with him, and he lives second door to a rubber president, and we concluded that we would like to have him spread the influence among our friends. I am sure you will be interested in hearing from my friend and bishop, Frank DuMoulin.

BISHOP DU MOULIN' ON AMERICA'S ETHICAL OPPORTUNITIES.

Genial Bishop DuMoulin, whose beneficent influence has found such generous expression in the welfare work of the rubber factories of Ohio, spoke with earnestness and enthusiasm in appreciation of the importance of the finer sensibilities in business and social relations. Four types of men represent about all there is of life to-day, according to Bishop DuMoulin, the commercial man, the teacher, the ethical man—ever growing more important in this humanitarian age—and the prophet. The viewpoints, achievements and shortcomings of each in their relations one to another he pictured convincingly, and then in the rôle of both prophet and ethical man he pictured brilliantly the wonderful opportunities for progress in every line of human endeavor. Said he in conclusion:

BISHOP DuMOULIN.

It is a mark of the age that a minister, a weak-kneed, effeminate, anaemic minister, if you please, should be allowed to sit at this board with ex-presidents and kings of finance as they discuss the merits of the greatest factor and element in all the world's history, and that he should be allowed to make his contribution to a symposium of the character in which we have all joined tonight. It is because men consciously or unconsciously are getting down to the roots of things, are getting down to the fundamental base upon which the whole of life is structured and upbuilt and developed. * * * You and I are living in an age which will be looked upon, when the history of life is written, as being the greatest transitional age the world has ever seen. There is not the element of finality about this age; there is not a single atom of completeness about it; it is a contradictory age; it is an introductory age; it is an age of expediency; the human race is forward bound, its hope is in the future, its golden age has yet to come; it is in the vanguard of things; it is looking forward as it never looked forward before, save in one period of three years, in all its far-reaching history. Why, the world has reached that adolescent period in its history, in its development, which constitute it the mightiest opportunity for the men who live in it that has ever been given to any generation of the sons of man. Because we have reached the heir of the ages, we have reached that time that we may well call the nick of time, the strategic era, the pivotal point in the world's history, when every act of morality and truth and self-sacrifice and goodness to-day will be worth a hundred later on, just as it is worth a hundred of anything that has gone. You and I have the privilege of living in the mightiest epoch of human affairs that history has ever recorded or men have ever known; that accounts for its confusions, its upheavals, its cataclysmic and almost unbelievable desires because the whole world is in influx, is in process, is forward-bound, is in its birth pangs of suffering and blood; and there is a brighter day upon us. As we stand on this threshold age, the eastern sky is streaked with the crimson of the morning sun of a new day, created by the blood-red banners that spell progress and happiness and achievement for our humanity, and may a beneficent Creator who has given us the privilege of living at this epoch in human affairs, give us such sense of responsibility in our commerce, and our education and our ethics, that we may be fitted to the age in which we live, that we may to the full realize the maximum of progress, that we may gain the largest dividend of human welfare and achievement, until the knowledge of truth, of God, and all that is best in life, shall cover this wide world as the very waters cover the sea.

THE MEMBERS AND GUESTS PRESENT.

RETIRING BOARD OF DIRECTORS' AND EXECUTIVE COMMITTEE MEETING.

THE retiring board of directors met at the Union League Club, New York City, January 6, at 12.30 P. M., and confirmed all the acts of the Executive Committee during the past year. It was decided to combine the Committee on Uniform Crude Rubber Contract with the Committee on Crude Rubber Nomenclature and under the former title. The directors passed a resolution recommending that the name, "The Rubber Club of America, Inc.," be changed to "The Rubber Association of America." It was resolved that in the future a member to be eligible to associate membership must be connected with a firm member. The directors voted that the association should be represented at the National Security League's Congress of Constructive Preparedness to be held in Washington, D. C., January 25-27. Amedee Spadone, Gutta Percha & Rubber Manufacturing Co., New York City, was the delegate appointed to represent the Rubber Club.

The Executive Committee then went into session and the following firm members were elected:

FIRM MEMBERS.

A. J. Bates & Co., Inc., New York City.—Representative, Frederick B. Nickel.

The Carter Bell Manufacturing Co., New York City.—Representative, W. H. Chichester.

Norwalk Tire & Rubber Co., Norwalk, Connecticut.—Representative, Dr. David Spence.

Hazen-Brown Co., Brockton, Massachusetts.—Representative, Max Brown, transferred from Associate Membership.

Panther Rubber Manufacturing Co., Stoughton, Massachusetts.—Representative, Frank Berenstein.

Manhasset Manufacturing Co., Providence, Rhode Island.—Representative, Roland H. Ballou, transferred from Associate Membership.

The Interocean Oil Co., New York City.—Representative, W. G. Thomas, Jr.

The Standard Tire & Rubber Manufacturing Co., Cleveland, Ohio.—Representative, M. J. Gillen.

Maguire Rubber Co., New York City.—Representative, J. B. Maguire.

Eugene Doherty Rubber Works, Inc., Brooklyn, New York.—Representative, Philip A. Doherty.

Rubber Insulated Metals Corp., Plainfield, New Jersey.—Representative, Charles P. L. Huston.

Danversport Rubber Co., Boston, Massachusetts.—Representative, Frederic Barlow.

The H. F. Taintor Manufacturing Co., New York City.—Representative, Harry Taintor.

E. M. & F. Waldo, New York City.—Representative, Edward M. Waldo.

Frank B. Ross & Co., New York City.—Representative, Frank B. Ross.

C. L. Hawthaway & Sons, Inc., Boston, Massachusetts.—Representative, Clarence L. Hawthaway.

Jenckes Spinning Co., Pawtucket, Rhode Island.—Representative, F. L. Jenckes.

The Luzerne Rubber Co., Trenton, New Jersey.—Representative, Bruce Bedford or C. Dudley Wilson.

Monatiquot Rubber Works Co., South Braintree, Massachusetts.—Representative, Robert C. Harlow.

The applications for Associate Membership were laid on the table for consideration at the next meeting.

The Annual Meeting of the Rubber Club of America, Inc.

THE annual meeting of The Rubber Club of America, Inc., was held at 2:30 P. M., January 8, at the Waldorf-Astoria, New York City. After the reading of the minutes of the previous meeting, the reports of the officers, covering the club's many activities of the past year, were read and adopted.

SECRETARY'S REPORT.

Since our last annual meeting the firm membership of The Rubber Club of America, Inc., has increased to 231 firms in the rubber and allied industries, which is an increase of 20 per cent, and our associate membership has increased from 227 individuals connected with the rubber industry to 242.

During the eleven months covered by this report the executive committee has held five meetings and the board of directors has held one session. Numerous committee meetings have been held at the association headquarters, where the directors' room is always at the disposal of our membership and for meeting purposes.

The organization of several groups of manufacturers as divisions of The Rubber Club of America, Inc., is very gratifying, as is the affiliation of the Rubber Reclaimers' Club as a division.

The annual mid-summer outing was held for the second year at the Vesper Country Club at Lowell, Massachusetts, and the attendance was over 300, and over 125 more than at the outing the year previous. Special trains were run from Akron and New York, and the outing was voted the most enjoyable of any in the history of the association.

The banquet of 1916 was held at the Waldorf-Astoria on the evening following the annual meeting on February 2, 1916. The attendance was nearly 300, which was a substantial increase over the previous year.

Since our last annual meeting we have lost the following members by death:

Richard H. Linburg, president of the United and Globe Manufacturing Cos., died at Trenton, New Jersey, January 5, 1916.

William Lyall, president of The Brighton Mills, Passaic, New Jersey, died in New York City January 13, 1916.

Charles Henry Arnold, of Arnold & Zeiss, died in New York City February 20, 1916.

John Hopewell, former president of The Reading Rubber Manufacturing Co., died at Washington, D. C., March 28, 1916.

George David Hazen, of The Hazen Brown Co., died at Brockton, Massachusetts, April 13, 1916.

Le Baron C. Colt, vice-president and general manager of The National India Rubber Co., died at Bristol, Rhode Island, May 25, 1916.

F. C. Breakspear, with A. G. Spalding & Bros. Manufacturing Co., Chicopee, Massachusetts, died at New York City, June 2, 1916.

James H. Seiberling, president and general manager of The Indiana Rubber & Insulated Wire Co., died at Jonesboro, Indiana, July 7, 1916.

Robert J. Bowes, with the Lawrence Felting Co., died at Millville, Massachusetts, on September 11, 1916.

Paul Schmidt, secretary of the Rubber & Guayule Agency, Inc., died at Englewood, New Jersey, on September 13, 1916.

Philip Braender, president of the Braender Tire & Rubber Co., died at White Plains, New York, November 4, 1916.

John Henry Flint, president of the Tyer Rubber Co., president of the New England Rubber Club, 1905-1906, and director, 1902-1905, 1905-1916, died at Andover, Massachusetts, on November 29, 1916.

Consideration of the reports of four special committees was then taken up.

A UNIFORM CRUDE RUBBER CONTRACT.

First came that of the Committee on a Uniform Crude Rubber Contract, H. Stuart Hotchkiss, chairman. As the result of long deliberation, a set of rules for the regulation of the traffic in crude rubber had been previously submitted to the membership by mail for study, and was then discussed paragraph by para-

graph and finally adopted as reprinted below, subject to later amendments by the Executive Committee if found necessary or desirable. By this action the Club did not take the position of discouraging special contracts between manufacturers and dealers, the idea being to provide a workable standard of rules and definitions to govern in all cases where rubber is sold "under the rules of The Rubber Club of America, Inc." It is the belief of the Committee that the interests of the manufacturer, the importer and dealer have been protected. The revised and adopted draft follows:

RULES.

All sales purporting to be made subject to the rules of The Rubber Club of America, Inc., shall be considered as made subject to the following rules:

1. STANDARD QUALITIES. Standard qualities consist of the following:

- (a) *Hevea* First Crêpe
- Hevea* Ribbed Smoked Sheets
- Hevea* Plain or Smooth Smoked Sheets and/or Biscuits
- Hevea* Unsmoked Sheets and/or Biscuits

to be understood as per standard samples on file with The Rubber Club of America, Inc., at New York and at Akron, Ohio, said samples to be renewed at least once every six months.

Para Standards—to be as understood in New York.

- (b) Other qualities—to be as described in sales contract.

2. OTHER QUALITIES. Where a parcel of rubber is sold under one of the standard descriptions or under a description superior to the standard for a definite shipment, arrival, delivery, or on the spot, and is found inferior in whole or in part, the buyer shall have the option of rejection and the quantity so rejected, whether the whole or any portion, shall not constitute a delivery on the contract. Should the time for delivery have expired the seller shall have ten days to replace the quantity rejected at the original point of arrival or delivery in the United States of America or at the port of New York, provided that such quantity was in the opinion of the arbitrators a bona fide tender against the contract. In case the seller does not replace, the buyer at his option may cancel the contract, or buy and charge the difference, if any, to the seller.

3. Where a parcel of rubber is sold with a description of quality inferior to that specified in Rule 1, Section A, and upon delivery is found inferior in whole or in part, then the buyer must accept the same with allowance, provided such allowance in the opinion of the arbitrators, be not more than two cents per pound on the inferior portion; but should the parcel, in whole or in part, be rejected, the seller shall substitute proper quality to fulfil his contract at the original point of delivery in the United States of America or Canada or at the Port of New York within ten days from the time of rejection or within the time for delivery as the case may be. In case the seller does not replace, the buyer at his option may cancel the contract, or buy and charge the difference, if any, to the seller.

4. The word "Ton" shall mean a ton of 2,240 pounds.

5. DELIVERY WEIGHTS. Final delivery on any contract to be within 100 pounds of the weight contracted for, but in any case the nearest weight of the contract quantity that the average weight of the packages of the final tender admits. But where it is found impossible to deliver within 100 pounds, taking the average weight of the packages tendered, any deficiency or excess, shall be invoiced or invoiced back, as the case may be, at the market price on the date of delivery. Should buyer and seller fail to agree on the market valuation at such time, same is to be fixed, without fee, by the Arbitration Committee.

6. The words "about," or "more or less," when used to define quantities contracted for, shall mean the nearest amount which seller can fairly and reasonably deliver, but no excess or deficiency shall be greater than 2½ per cent. This rule shall apply only on specific lots.

7. DECLARATION OF VESSELS. After declaration, should the vessel, or vessels, carrying any portion of a contract calling for shipment or arrival be lost, such contract is to be cancelled to the extent of the goods lost.

Should the shipment not be declared by the seller prior to the loss of the vessel carrying the shipment, such loss shall not vitiate the contract or any part thereof.

8. **PROMPT SHIPMENT.** The term "prompt shipment" from foreign ports shall, under normal conditions, be considered as follows:

Within a period of—

Fifteen days, if shipped from Great Britain or Europe.

Thirty days, if shipped from the Far East.

Thirty days, if shipped from the Amazon Valley.

9. **CHECKING WEIGHTS AND APPROVING QUALITIES.** The buyer shall have the option of having his representative at the dock or warehouse to check the weights or to pass upon the quality. In the event that weights or quality are approved the responsibility of the seller ceases in respect to said weights or quality.

In event buyer does not exercise this option, actual gross weights with proper tare allowance "ex dock" or "ex store" at port of arrival shall govern weights and point of delivery in the fulfillment of a contract.

10. **SELLER'S RESPONSIBILITY.** In the event of the seller making shipment direct to the buyer, then the seller's responsibility for the safety of the goods does not cease until the goods are delivered to the transportation company or its agents. Should buyer designate an agent or representative to take delivery, seller's responsibility ceases when delivery order is in the possession of said agent or representative and goods have passed the weighmaster's scales.

11. **WEIGHING AND TARING.** Unless otherwise stated in the contract, all tenders of plantation rubber or rubber in bales, may be weighed in drafts at the option of the seller. Rubber shall be weighed gross to the 1 pound, if in drafts, and shall be weighed to the ½ pound, if weighed by the package. Cases tared shall be weighed to the ½ pound. Paras shall be grossed and tared case by case to 1 pound. All other grades of rubber which cannot be readily tared are to be billed at tares guaranteed by seller.

12. **MONTHLY DELIVERY CONTRACT.** Where a contract calls for monthly delivery, arrival or shipment, each month's or specified part of a month's delivery or shipment is to be treated as a separate contract.

13. **OPTION OF DELIVERIES.** Where rubber is sold for shipment from a foreign port, the seller may tender in fulfillment of the contract rubber not coming from that port, provided it is of the same description and quality as the rubber named in the contract and is tendered according to the terms of the contract so far as the time and place of delivery are concerned.

14. **NOTIFICATION OF REJECTIONS.** If acceptance of any parcel of rubber is refused by a buyer, notification must be given the seller in writing within seven days after receipt in the buyer's factory, stating specific reasons for such rejection. In case of claims or rejection rubber shall remain in original cases pending final determination.

15. **SPECIAL AGREEMENTS.** Any special agreement expressed in a contract supersedes any of these rules to the extent the rule is affected thereby.

16. **FAILURE TO FULFIL CONTRACT.** Whenever it may be admitted by the seller or decided by arbitration that the seller has failed to fulfil the terms of a contract then the buyer may, at his option, cancel the contract, or purchase quality called for in the open market charging the difference, if any, to the seller.

Whenever it may be admitted by the buyer or decided by arbitration that the buyer has failed to fulfil the terms of a contract, then the seller shall be released from all obligations connected thereto, and buyer shall be responsible for any loss occasioned by said failure.

17. **GOVERNMENT TAXES.** On contract for future delivery any import duty or tax imposed by the United States Government on crude rubber shall be for the account of the buyer.

18. **GUARANTEE OF SHRINKAGE.** When the rubber is sold on a guaranteed shrinkage in washing and drying, buyer must render the return to the seller within three months from the time of delivery.

19. **PLACE OF DELIVERY.** It is understood that when goods are sold "ex dock" or "ex store New York," the point of delivery shall mean the Port of New York.

20. **MISCELLANEOUS.** A contract calling "for delivery" shall be construed to mean that the rubber shall be weighed and ready for shipment or tender to the buyer during the period stipulated in the contract.

A contract calling "for arrival" during a certain period shall be construed to mean that it shall arrive upon a vessel due at the port named during the time stipulated in the contract and is to be tendered or shipped as soon thereafter as conditions permit.

A contract calling for shipment from a certain country or countries or a specified foreign port during a certain period or periods shall be construed to mean that the date of the bill of lading at

the port of shipment covering such goods called for in the contract shall be within the time stipulated for shipment.

21. **ARBITRATION.** All disputes between buyer and seller are to be settled by arbitration by the arbitrators of The Rubber Club of America, Inc., the award of the arbitrators to be final.

REPORT OF THE PREPAREDNESS COMMITTEE.

Tremendous changes in international and national events bring up the question whether our industrial organizations cannot play a much broader and more useful part than has generally been done in the past. It is difficult at this distance to appreciate the progress made in Europe toward combination of effort and resources in individual industries, as well as among industries, all of which is being hastened and directed by the government. This movement is likely to continue and develop long after the war, and much of its incentive is based upon American competition. Manufacturers are burying their antagonisms of long standing and coöperating with each other to a degree astonishing to one acquainted with British conservatism of the past.

The national council of defense and the national research committee are laying out very comprehensive plans with similar tendencies for this country. The Rubber Club has a remarkable opportunity to display leadership in the mobilization of our industrial resources and in the developing of that high type of coöperation, which will become more and more essential as these movements progress. For instance, it has already been brought to the attention of Washington that the entire rubber industry would be crippled in the event of hostilities with any important maritime nation, and probably the research committee will recommend that research work be carried on in connection with either synthetic rubber or the development of a supply of natural rubber within our own borders. This latter problem looks more difficult than the former, but, considering the absolute dependence of the rubber industry upon its supply of basic material, is it not the part of good business to have the industry undertake to insure that supply by the best means that our scientific men can point out? Why not have the Rubber Club appoint a committee of representative technical men within the industry to coöperate with the research committee and lay plans for the carrying on of research work by the industry if that appears to be the best plan? Starting with rubber, many other problems will come to mind, which could far better be investigated by the industry than by individual manufacturers. The automobile people have shown the world the advantage of unselfish coöperation, and the rubber industry perhaps represents the opposite extreme.

I should like to suggest, therefore, that the existing preparedness committee be discharged at the coming annual meeting, and that the directors of the Rubber Club organize among their active members a group to make this general problem an important operating feature of the Rubber Club. An industry that is capable of indefinite expansion, as the rubber industry is, will probably do more for its individual members upon a coöperative than upon an extremely competitive basis. Not only that, but the tendency of the world will force us in this direction in spite of ourselves. So is it not the part of intelligent business men to lead rather than be driven in the right direction?

In accordance with the suggestion of R. B. Price, chairman of the Preparedness Committee, contained in his report read by the secretary in Mr. Price's absence, this committee was discharged and its recommendations referred to the Executive Committee with power to take such action as may be deemed wise. In this connection President Firestone pointed out the desirability of a Committee on Research to work out the technicalities in the development of rubber growing and synthetic rubber, and anything that pertains to the development and betterment of the rubber industry.

THE LEGISLATIVE COMMITTEE IS HEARD FROM.

Frederic C. Hood, chairman of the Legislative Committee, had prepared no report, but addressed the members upon the important work that ought to be undertaken. He emphasized the importance of gathering facts and their proper presentation to governmental committees, pointed out the shortcomings of the average business man as an orator, and stated emphatically that such problems as the proposed import duty on crude rubber and the National Workmen's Compensation Act demand the attention of a legislative committee in which the utmost confidence is reposed and which will be accorded the full support of the Club.

THE DIRECTORS ARE ELECTED

Unanimous action of the recommendation of the Committee on Nominations, Samuel F. Sawyer, chairman, the following board of directors was elected for the ensuing year:

William E. Bruyn, L. Littlejohn & Co., New York City.

Van H. Cartmell, Kelly-Springfield Tire Co., New York City.

Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.

H. Stuart Hotchkiss, United States Rubber Co. System, New York City.

William J. Kelly, Arnold & Zeiss, New York City.

P. W. Litchfield, Goodyear Tire & Rubber Co., Akron, Ohio.

J. S. Lowman, Philadelphia Rubber Works Co., Akron, Ohio.

W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.

Charles T. Wilson, Charles T. Wilson Co., Inc., New York City.

Tracy S. Lewis, Beacon Falls Rubber Shoe Co., Beacon Falls, Conn.

John A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey.

Charles A. Daniel, Quaker City Rubber Co., Philadelphia, Pennsylvania.

AMENDMENTS TO THE CONSTITUTION AND BY-LAWS.

The proposed amendment to Article VI, Section 2, of the Constitution and By-Laws, a draft of which had previously been submitted to the membership, was unanimously adopted. It

J. A. LAMBERT

T. S. LEWIS.

W. O. RUTHERFORD.

P. W. LITCHFIELD.

C. A. DANIEL.

VAN H. CARTMELL,
First Vice-President.

HARVEY S. FIRESTONE.
President.

H. STUART HOTCHKISS,
Second Vice-President.

W. E. BRUYN.

C. T. WILSON

Underwood & Underwood, N. Y.
H. S. VORHIS,
Secretary

J. S. LOWMAN.

Underwood & Underwood, N. Y.
W. J. KELLY.

DIRECTORS OF THE RUBBER CLUB OF AMERICA, INC.

provides for a Committee on Arbitration, and specifies its duties as follows:

A Committee on Arbitration to consist of seven members, four of whom shall be manufacturers and three crude rubber importers. The chairman of such committee shall be chosen by the members from their own number for a term of three years, and the term of each of the additional members shall be three years, except that at the time when this committee shall be originally appointed the six members then appointed, other than the chairman, shall decide by lot which of their number shall serve for periods of one, two, and three years respectively, two members of the committee being assigned to each class, and that thereafter two members shall be appointed by the board of directors or by the Executive Committee in each year. If any vacancies should occur in this committee, such vacancies may be filled by the board of directors or by the Executive Committee at any regular or special meeting.

DUTIES. This committee shall have complete supervision in respect to all matters for arbitration referred to The Rubber Club of America, Inc., and shall make rules and regulations for the conduct and disposition of all matters submitted to arbitration subject to the approval of the board of directors or of the Executive Committee. It shall provide a form of agreement not inconsistent with existing provisions of law by which, so far as practicable, the decisions of the arbitrator or arbitrators shall be as effective as judgments of the Supreme Court of the State of New York. It shall compile, and from time to time revise, and keep a list of qualified persons, not less than 25, willing to act as arbitrators under these rules, and who shall be members of The Rubber Club of America, Inc. This list shall be known as "The List of Official Arbitrators of the Rubber Club of America, Inc."

The proposed change in Article III of the Constitution and By-Laws was also adopted to read:

Any person connected with a corporation or firm, and engaged in the rubber industry in the United States of America or the Dominion of Canada, which corporation or firm has been elected a firm member of this association, shall be eligible to membership.

CHANGE OF NAME.

The recommendation of the board of directors that the name of the organization be changed to The Rubber Association of America, as more accurately describing its real character and activities, was then put to a vote and unanimously adopted.

OFFICERS RE-ELECTED.

After the annual meeting the new board of directors went into session and the following officers and Executive Committee of The Rubber Club of America, Inc., were reelected:

OFFICERS.

President, Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.

First vice-president, Van H. Cartmell, Kelly-Springfield Tire Co., New York City.

Second vice-president, H. Stuart Hotchkiss, United States Rubber Co. System, New York City.

Secretary and treasurer, Harry S. Vorhis, The Rubber Association of America, New York City.

EXECUTIVE COMMITTEE.

Harvey S. Firestone, Chairman, Firestone Tire & Rubber Co., Akron, Ohio.

George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York.

William E. Bruyn, L. Littlejohn & Co., New York City.

Van H. Cartmell, Kelly-Springfield Tire Co., New York City.

Paul W. Litchfield, The Goodyear Tire & Rubber Co., Akron, Ohio.

H. Stuart Hotchkiss, The United States Rubber Co. System, New York City.

STANDING COMMITTEES.

The president of the Rubber Club has appointed the following committees:

LEGISLATIVE COMMITTEE.

Frederic C. Hood, chairman, Hood Rubber Co., Watertown, Massachusetts.

H. Stuart Hotchkiss, The United States Rubber Co. System, New York City.

One member yet to be chosen.

ARBITRATION COMMITTEE.

William E. Bruyn, L. Littlejohn & Co., New York City.

Andrew H. Brown, Meyer & Brown, New York City.

W. G. Ryckman, New York City.

William F. Bass, General Rubber Co., New York City.

M. L. Cramer, Michelin Tire Co., Milltown, New Jersey.

Horace De Lisser, Ajax Rubber Co., Inc., New York City.

R. B. Woodbury, Hood Rubber Co., Watertown, Massachusetts, and as alternates:

H. A. Astlett, H. A. Astlett & Co., New York City.

Clement B. McKay, The Fisk Rubber Co., New York City.

NOMINATING COMMITTEE.

Frederick H. Jones, chairman, Tyler Rubber Co., Andover, Massachusetts.

William J. Kelly, Arnold & Zeiss, New York City.

W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.

Henry C. Pearson, India Rubber Publishing Co., New York City.

Harry G. Fisk, The Fisk Rubber Co., Chicopee Falls, Massachusetts.

AUDITING COMMITTEE.

E. E. Huber, chairman, Eberhard Faber, Brooklyn, N. Y.

William G. Grieb, Ajax Rubber Co., Inc., New York City.

BANQUET COMMITTEE.

William T. Cole, chairman, Fabric Fire Hose Co., New York City.

Francis R. Henderson, Henderson & Korn, New York City.

Tracy S. Lewis, Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.

ROUTING COMMITTEE.

To be selected later by the executive committee.

At a meeting of the executive committee, held January 19, 1917, at the Whitehall Club, 17 Battery Place, New York City, the following firm and associate members were elected:

NEW FIRM MEMBERS.

Rosenwald & Weil, Chicago, Illinois—Representative, H. T. Kessler.

B. S. Ellis, New York City—Representative, B. S. Ellis.

E. S. Kuh & Valk Co., New York City—Representative, Chas. Thorstensen.

Robinson Co., New York City—Representative, Thos. A. Desmond.

T. C. Ashley & Co., Boston, Massachusetts—Representative, Archer S. Pratt.

Somerset Rubber Reclaiming Works, New Brunswick, New Jersey—Representative, A. Marcus.

Chadbourne & Moore, Boston, Massachusetts—Representative, Joseph H. Chadbourne.

Plymouth Rubber Co., Canton, Massachusetts—Representative, Abraham Sydeman (transferred from associate membership).

ASSOCIATE MEMBERS.

Geo. W. Skirm, Trenton, New Jersey, Globe Rubber Tire Manufacturing Co.

E. S. Sloat, Patterson, New York, Mishawaka Woolen Manufacturing Co.

Raymond S. Willis, East Orange, New Jersey, United States Rubber Co.

J. M. S. Carroll, Montreal, Canada, Canadian Consolidated Rubber Co., Limited.

Frank C. Foley, New York City, The Fisk Rubber Co.

Wm. E. Kavenagh, Akron, Ohio, Swinehart Tire & Rubber Co.

Charles W. Barnes, New York City, United States Rubber Co.
Merton A. Turner, South Braintree, Massachusetts, Monaquot Rubber Works Co.

James H. Stedman, South Braintree, Massachusetts, Monaquot Rubber Works Co.

DIVISIONS' MEETINGS.

THE following meetings of the divisions of the Rubber Club were held at the Waldorf-Astoria on Monday, January 8:

THE RUBBER & FIBER SOLE MANUFACTURERS' DIVISION was organized, and a Constitution and By-laws adopted. W. H. Yule, The B. F. Goodrich Co., Akron, Ohio, was elected chairman and William M. Gunlock, United States Rubber Co. System, vice-chairman. The following Executive Committee was also elected: W. H. Yule, chairman, The B. F. Goodrich Co.; William Gunlock, United States Rubber Co. System; George E. Hall, Boston Woven Hose & Rubber Co., Cambridge, Massachusetts; C. H. Oakley, Essex Rubber Co., Inc., Trenton, New Jersey; George B. Dryden, Dryden Rubber Co., Chicago, Illinois, and an additional member who will be appointed later.

THE RUBBER SUNDRIES MANUFACTURERS' DIVISION in meeting elected Frederick H. Jones, Tyer Rubber Co., chairman, Andover, Massachusetts; W. O. Rutherford, vice-chairman, The B. F. Goodrich Co., Akron, Ohio, and the following Executive Committee: Frederick H. Jones, chairman, Tyer Rubber Co., Andover, Massachusetts; Russell Parker, Parker, Stearns & Co., Brooklyn, New York; Charles J. Davol, Davol Rubber Co., Providence, Rhode Island; George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York; E. E. Huber, Eberhard Faber, Brooklyn, New York; Thomas W. Miller, Faultless Rubber Co., Ashland, Ohio.

THE MECHANICAL RUBBER GOODS MANUFACTURERS' Division elected William T. Cole chairman, Fabric Fire Hose Co., New York City; John J. Voorhees, vice-chairman, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey. The Executive Committee consisting of five members will be appointed later.

THE RUBBER RECLAIMERS' CLUB met and voted to organize as a division of the Rubber Club to be known as the Rubber Reclaimers' Division. Captain Francis H. Appleton was elected chairman.

Harry S. Vorhis was elected secretary and treasurer of all the divisions.

AMERICAN COMPETITION IN TIRES RESENTED.

IN a recent Trade Supplement published by the "London Times" a prominent British rubber manufacturer writes as follows:

From the West has come a Colossus which they do fear, and with good cause. It seems a harsh thing to say, but there can be no doubt that the American rubber trade has deliberately set out to capture the business of the British rubber manufacturers whilst the latter are preoccupied and handicapped by war work. Before the war the Americans had secured little or no hold on the British market, and less, to use an Irishism, in the Colonies. Now let the figures speak. In motor tires alone, excluding those fitted to vehicles, the imports into Great Britain have been as follows:

Year 1914	£ 270,550
Year 1915	1,225,422
First half of 1916	1,063,585
The total United States exports of motor tires for the years ended June 30 being:	
1914	\$ 3,505,267
1915	4,963,270
1916	17,936,227

Needless to say the huge increase for 1916 is not a newly-created trade, but the result of a deliberate campaign of flooding our Colonies and other markets with huge quantities of American tires.

The ordinary business man at this stage would naturally ask why the government does not intervene to prevent the import of

unwanted goods and the consequent export of gold to pay for them by a Prohibition of Import Order. But here we enter the realms of high diplomacy. An order was actually made, and withdrawn at the eleventh hour, as it was stated in the House of Commons that an arrangement existed with American manufacturers which precluded the possibility of prohibiting the import of these goods.

It is certain, however, that the first pioneers of British plantation rubber, when they smuggled away the *Hevea* seeds from Brazil, little thought that by giving Britain control of the world's supply of rubber they would be doing at the same time an injury to British rubber manufacturers. Such, however, is in effect what has happened, as the arrangement with American manufacturers was to allow them supplies of British rubber in consideration of their executing all their orders for neutral European countries through Great Britain. If, therefore, there had been no British rubber there would be no American tires now coming into Great Britain.

The planter is inclined to take the view that because he is able to sell his production at a handsome profit all is well with it. He should, however, not wait for the writing on the wall. Some of the world's largest consumers are developing their own estates, mainly to get over this bogy of variability, and the day may come when a rubber will have to stand or fall on its quality and its attainment of a certain standard.

All this points to the necessity of combination between the producing and manufacturing sides of the industry. A joint research commission should therefore be formed composed of the best technical men obtainable on both sides, and a definite program carried out, in the interests of the industry.

It seems a somewhat unfortunate state of affairs that whilst of the expected world's production of crude rubber for 1916 about 75 per cent will be produced within the British Empire, probably not more than about 12 per cent of it will be consumed by British manufacturers. Of the remainder probably 62½ per cent will be used by the United States.

They will probably need for 1916 at least 125,000 tons, which on a rough and ready calculation may be taken to represent the production of goods of a selling value of £125,000,000. Three of the principal concerns will together show a total turnover for the current year of approximately £50,000,000.

As to whether any considerable portion of this huge business could be done on this side under different economic conditions is open to doubt. To commence with it is attributable to a great extent to the universal prosperity and the high wages of the working classes in the States. At the end of this year it is expected that the total number of cars registered in the United States will be 3,250,000, or approximately one to every 32 persons. The consumption of tires in the upkeep of these cars is of course enormous.

The figures for the British rubber trade compared with those for the United States seem small, but none the less it ranks as one of the more important industries of the country, with an output of from twenty to twenty-five millions sterling. At any rate, it is a sufficiently important national asset for the government and nation to see that it is not swallowed up by the American Goliath.

In conclusion, one may be permitted to wonder why, when the nation is being taxed to the uttermost farthing in every direction, neutrals should not be made to bear a slight contribution towards the cost of the war, from which they are profiting so greatly. An export duty on crude rubber sent out of the British Dominions of only 6d. per pound would bring in probably £6,000,000 and would certainly not reduce the exports by one pound. It would, moreover, not make the price prohibitive, as a sixpenny rise in the price of rubber is by no means rare. But perhaps the Rubber Growers' Association would have much to say on such a proposal.

DIRECT SHIPMENT OF RUBBER GOODS TO PORTUGAL.

The following notification has recently been received from the British Consulate General at New York City:

I have to inform you that Portugal may now be regarded as on the same footing as other allied countries in Europe, in connection with the rubber guarantee.

It will, therefore, be in order for manufacturers to ship rubber goods by direct steamer to Portugal in the future.

CORRECTION.

In the notice concerning the resignation of the superintendent of Parker, Stearns & Co. appearing in the January number of THE INDIA RUBBER WORLD, the name should read F. G. Littell, instead of F. G. Hettell.

The New York Automobile Show.

A GAIN previous records have been surpassed at the seventeenth annual National Automobile Show held at the Grand Central Palace, New York City, from January 6 to 13. Attendance and business were the greatest in history and a larger number of cars and chassis—340 in all—was shown by 98 firms. Accessory exhibitors were not as numerous as last season, although occupying 6,000 square feet more space, but their products were no less varied nor interesting, and really sounded the keynote of the show. Of the 230 firms on the official program many were manufacturers of goods containing rubber. As in the past, several large tire concerns did not exhibit but the many cars shown displayed most of the leading tires and treads, while the Firestone, Goodrich, Ajax and Century firms were represented by advertisements in the program. Among the exhibits of interest to readers of THE INDIA RUBBER WORLD may be mentioned the following:

TIRES AND TUBES.

The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, showed its "Angle" and "Runner" tread tires, built up in the center where the most wear comes; also its extra heavy red tubes and regular gray tubes.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, displayed the Dayton pneumatic tire with its heavy central rib and open-weave breaker strip forming a reinforcement around the rubber and riveting it thoroughly to the carcass.

Century, hand-made, oversize tires and Century red inner tubes were the products of the Rubber Insulated Metals Corporation, Plainfield, New Jersey. A convenient type of rubber-handled, insulated pliers for safety in repairing the electrical equipment of motor cars was also offered.

General tires were shown by the General Tire Co., Akron, Ohio.

The Woodworth Manufacturing Corporation, successor to the Leather Tire Goods Co., Niagara Falls, New York, demonstrated the construction of the Woodworth Trouble-Proof tire with its strip of chrome leather inside the shoe where it is not subjected to the action of moisture and dirt; also an inner tube with the grain of the several plies running in different directions to reduce tearing to a minimum. The Woodworth Tread and Woodworth Overshoe, both of studded leather, were shown together with a line of tire accessories including tire boots, inner sleeves, inside patches, fan belts and Easyon tire chains.

The air-retaining qualities of Bonner tubes, which are claimed to be self-closing when punctured, was demonstrated by the Brunswick-Balke-Collender Co., Chicago and New York. The tread, into which is vulcanized a strip of non-stretchable fabric, is built to extra thickness by the laminated process and turned inside out before joining the ends. The larger circumference thus becomes the inner circumference and when the tube is inflated the thickened rubber tread is automatically compressed to a point where it will close all ordinary punctures instantly and without loss of air pressure.

TIRE REPAIR DEVICES.

The Adamson Manufacturing Co., East Palestine, Ohio, featured four vulcanizers and Adamson repair gum requiring no cement. Of the vulcanizers Model "U" is for tubes and casings; Model "T" for inner tubes only; Model "S" for private garages and repair shops, and Model "M" for cycle tubes.

The C. A. Shaler Co., Waupun, Wisconsin, had a complete exhibit of similar vulcanizers, small portable and garage installations, with heat from gasoline, alcohol, electricity and steam.

The exhibit of Stevens & Co., New York City, consisted of the Sampson repair kit for inner tube work, including the Sampson Featheredge Puncture plug, an ingenious quick-repair device

composed of two rubber disks with perforated metal centers and a screw wire to draw the disks together. The hole is punched round to prevent tearing, spread with special pliers, the plug inserted and screwed up tight. Upon breaking off the wire below the surface of the plug and inflating the tire, the plug conforms to the inside of the casing as flat as a patch, and no wear, chafing or cutting is said to be possible.

The Eastern Rubber Co., Philadelphia, Pennsylvania, demonstrated Magic Rubber Mend, an inexpensive preparation for repairing quickly without vulcanization all articles of soft rubber, including punctured tubes. The result is said to be permanent and unaffected by heat, cold, moisture or dry air.

TIRE TOOLS AND ACCESSORIES.

The space occupied by the Stewart-Warner Speedometer Corporation, Chicago, Illinois, was devoted to an attractive presentation of several well-known and popular devices, including the Stewart engine-driven pump.

The Kellogg Manufacturing Company, Rochester, New York, had on view a motor-driven pump either air or water cooled.

The Crane tire pump was featured in the exhibit of the Bay State Pump Co., Boston, Massachusetts.

Air compressors were shown by the Auto Compressor Co., Wilmington, Ohio, and a two-stage type with models for all requirements was offered by the United States Air Compressor Co., Cleveland, Ohio.

Jacks and other specialties were offered by Lane Bros. Co., Poughkeepsie, New York; F. W. Mann Co., Milford, Connecticut; Moreau & Pratt, Inc., New York City; Weaver Manufacturing Co., Springfield, Illinois.

Standweld rims, seamless steel and brass tubing comprised the display of the Standard Welding Co., Cleveland, Ohio.

The simple and effective device of the Eureka Rim Compressor, Inc., Addison, New York, for the quick removal of tires from transversely split rims attracted favorable attention.

TOPS AND TOP MATERIALS.

L. J. Muttly Co., Boston, Massachusetts, showed its well-known Bull Dog rubberized mohair and cotton cloths for automobile tops and slip covers; also Numotor fabrics for top and seat cover purposes.

Neverleek for the same purposes was displayed by F. S. Carr Co., Boston, Massachusetts. Three surfaces in imitation of grain leather were offered; one dull and two semi-bright.

The Pantasote Co., New York City, demonstrated the sterling qualities of Pantasote for motor-car tops. This waterproof material is not merely a rubberized cloth, but consists of four layers, the surface coating with grain finish, fine cotton fabric, cementing gum, and a lining fabric of coarse weave.

The Detroit Weatherproof Body Co., Detroit, Michigan, had on view its all-weather, detachable top of high-grade waterproof material which converts the ordinary car into a limousine and is ideal for changeable weather. Patented Flexible sliding doors upon opening disappear instantly into the permanent roof, and the entire side sections may be quickly removed when so desired. This top weighs only about 50 pounds more than the ordinary type, including an electric dome lamp ready for connection at the dash.

The Laidlaw Co., Inc., New York City, showed Mortex for tops and cover purposes.

RUBBER ACCESSORIES.

Essex inner tubes—Royal Blue, Master Red and Champion Gray—were the principal exhibit of the Essex Rubber Co., Trenton, New Jersey. The company also manufactures a line of miscellaneous rubber accessories, including blow-out patches, tire

plasters, outer boots, reliners, pump, generator and lamp tubing, brake band lining, radiator hose, spring bumpers, gas engine packing, fan belts, rubber matting, hard rubber radiator caps and steering wheels, bicycle grips and goggles, many of which were shown.

An exceptionally complete line of rubber accessories was shown by the Voorhees Rubber Manufacturing Co., Jersey City, New Jersey. Of principal interest were the "Ideal" (red) and "Model" (gray) laminated tubes for automobiles and motorcycles. In addition to reliners, inner sleeves, boots, patches and all the customary materials for roadside repair, the firm deals in vulcanizing gums of all sorts, rebuilding fabrics and cements for the professional tire repairman, and also manufactures hose and tubing, fan belts, windshield packing, matting, sheet packing, bumpers, round springs, washers and rubber mallets.

Charles O. Tingley & Co., Rahway, New Jersey, offered a comprehensive line of sundries for automobile and cycle tire repair, featuring the C. O. T. Cement Cure Patches, Cure Tight Gum for tube blowouts, and String Repair Kit Plugs.

ELECTRICAL DEVICES.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, manufacturers of motors for all purposes, presented automobile motor-generator sets for charging, lighting, starting and ignition.

The General Electric Co., Schenectady, New York, also offered generator lighting and starting systems, electric lamps, bulbs, rectifiers and other specialties.

Other exhibitors of lighting and starting systems included the A. B. C. Starter Co., Detroit, Michigan; Bosch Magneto Co., New York City; Disco Electric Starter Corporation, Detroit, Michigan; Gray & Davis, Inc., Boston, Massachusetts; the John Heinze Co., Springfield, Ohio; Kemco Electric Manufacturing Co., Cleveland, Ohio; Leece-Neville Co., Cleveland, Ohio; North East Electric Co., Rochester, New York; A. J. Picard & Co., New York City; United States Light & Heat Corporation, Niagara Falls, New York; Wagner Hoyt Electric Co., New York City; Ward-Leonard Electric Co., Mount Vernon, New York.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, well known for its electrical control devices used extensively in rubber factories, attracted favorable notice with the compact, efficient C-H Magnetic Gear Shift and small, rugged automobile lighting switches for dash and steering post.

The General Bakelite Co. of New York City made an interesting display of molded electrical insulation.

Storage batteries were displayed by the Detroit Battery Co., Detroit, Michigan; Dyneto Electric Co., Syracuse, New York; Electric Storage Battery Co., Philadelphia, Pennsylvania; Gould Storage Battery Co., New York City; Paul N. Marko, Brooklyn, New York; Philadelphia Storage Battery Co., Philadelphia, Pennsylvania; Prest-O-Lite Co., Indianapolis, Indiana; United States Light & Heat Corporation, Niagara Falls, New York; Wagner-Hoyt Electric Co., New York City; Willard Storage Battery Co., Cleveland, Ohio.

Ignition devices for gasoline engines of every sort are manufactured by the following firms which were numbered among the exhibitors: Bosch Magneto Co., New York City; Ericsson Manufacturing Co., Buffalo, New York; Emil Grossman Manufacturing Co., Brooklyn, New York; The John O. Heinze Co., Springfield, Ohio; Heinze Electric Co., Lowell, Massachusetts; Herz & Co., New York City; Kent Manufacturing Works, Atwater, Philadelphia, Pennsylvania; K. W. Ignition Co., Cleveland, Ohio; Mosier & Co., Mount Vernon, New York; New York Coil Co., New York City; Splitdorf Electrical Co., Newark, New Jersey.

MISCELLANEOUS ACCESSORIES.

Charles E. Miller, New York City, with 15 stores in nine states, offered its complete line of sundries for motor-cars, motor-boats, motorcycles and motor-planes, among which were pneumatic tires and tubes of leading makes, repair materials and devices, together

with many varied tire and other rubber accessories, including the Twombly foot pump, which indeed "makes hard work a pleasure." The Vul-car, said to be the only alcohol-burning, portable vulcanizer for roadside repairs that protects the rubber with moisture so it cannot burn, was also of interest.

The silent chain employed in connection with the electrical equipment of rubber factories also supplies the "front end drive" of many automobiles, as exhibited in its latest improved form by the Morse Chain Co., Ithaca, New York.

A. Schrader's Son, Inc., Brooklyn, New York, offered the well-known "Universal" line of tire valves and accessories, in connection with which a unique circular was distributed. It had the appearance of an inter-line coupon railway ticket, as long as a man's arm, divided into eight detachable portions, one bearing the legend, "A Joy Ride to Contentment via A. Schrader's Son, Inc., Air Line," and each of the others bearing a cut and description of one of the "Universal" devices together with bright headlines in railway parlance.

The Raybestos Co., Bridgeport, Connecticut, showed its well-known brake linings and also demonstrated Royal brakes.

The Invincible Tire Tester, manufactured by the United States Gauge Co., New York City, in the shape of a watch, not only records the actual air pressure, but shows the proper pressure to be maintained in tires of various sizes.

Adams & Findley, New York City, offered the Rives Adjustable Neverslip Pedal Pads for greater safety in driving.

The Mattson Rubber Co., Lodi, New Jersey, showed the Mattson Slip-On Pedal Pads, readily adjustable in a few minutes and no metals to attach.

In connection with the Hoskyns Universal All-Weather Top for Ford Cars, displayed by the Universal Motor Products Co., Indianapolis, Indiana, rubber weather strips are ingeniously used to keep out drafts and eliminate noise.

The Metal Specialties Co., Chicago, Illinois, had a varied line of accessories and parts, including a few rubber goods.

THE BILTMORE SHOW.

The Miller Rubber Co., Akron, Ohio, displayed its large and varied line of rubber goods, featuring the new Miller "geared to the road" black-tread tire, red and gray tubes, and miscellaneous

tire accessories and repair materials, including retread bands, vulcanizing cement, Pluggum and the Shurtite tube repair kit, self-vulcanizing. An air bag for vulcanizing casings was shown and considerable interest was manifested in the Miller Demountable Cushion Pad, a shock-absorbing device for truck tires. It comprises a flat ring to be placed between the wooden felly of the wheel and the steel base of the solid rubber tire, consisting of a single strip of soft but tough resilient rubber $\frac{3}{8}$ inch thick with steel flanges on each side held in place by bolts let through

MILLER DEMOUNTABLE CUSHION PAD
FOR TRUCK TIRES.

the rubber from side to side at regular intervals. Many attractive circulars in English and Spanish were distributed, including a few devoted to balloons and toy novelties and druggists' sundries, also a convenient vest-pocket tire mileage record.

Tires and inner tubes were shown by the Norwalk Tire & Rubber Co., Norwalk, Connecticut.

In the space occupied by the H. W. Johns-Manville Co., New York City, were seen the well-known J-M Non-Burn Asbestos brake lining, fire extinguisher, Soot-Proof spark plug and speedometers.

S. A. E. ANNUAL MEETING.

THE attendance at the annual meeting of the Society of Automobile Engineers, held January 11, during Automobile Show Week in the Engineering Societies Building, New York City, exceeded all previous years, partly because of the interesting papers announced, but chiefly because of the broader present scope of the society, which now includes the designers of all forms of self-propelled vehicles and boats, including the airplane and tractor. The new members for 1916 number 338, bringing the total membership up to 2,121.

Perhaps the most important action at the meeting was the acceptance of the proposal to change the name to "The Society of Automotive Engineers," which will now be put to a vote by mail.

The following officers were elected for the ensuing year: George W. Dunham, president; Jesse G. Vincent, first vice-president; Charles M. Manly, second vice-president; Herbert Chase, treasurer; Benjamin B. Bachman, Harry L. Horning and Charles W. McKinley, members of the council for two years; Frederick E. Moskovics, member for one year.

All the Standards Committee reports were approved with little or no opposition except that of the Committee on Tires and Rims relative to truck tires, including the following proposed standard table for the carrying capacities of solid rubber tires:

Nominal width of tires	Gross load per wheel in pounds.	
	Tire diameter 36 inches and under	Tire diameter 40 inches and over
3 inches	1,000
3½ inches	1,300
4 inches	1,700
5 inches	2,500	2,600
6 inches	3,300	3,500
7 inches	4,200	4,500

The tolerance allowed was considered too generous by several members and this section was therefore referred to the Truck Standards Division for further study.

THE S. A. E. BANQUET.

Over 800 members gathered at the Hotel Biltmore on the evening of January 11 for the annual banquet which was the greatest similar event in its history. Judge Charles F. Moore was toastmaster and the speakers included Russell Huff, past president of the society, who reviewed S. A. E. accomplishments of the past year, and Howard E. Coffin, chairman of the Industrial Preparedness Committee of the Naval Consulting Board, whose subject was preparedness as affecting automobile manufacturers.

The principal speaker of the evening, however, was Hon. John Barrett, director-general of the Pan-American Union, who discussed "Pan-Americanism" and what it means to manufacturers of automobiles and their accessories. After sketching briefly the facilities afforded by the Pan-American Union to those wishing to enter the South American market—the only one now freely open to American manufacturers—he presented several significant facts no less important to manufacturers of tires than of automobiles. Said he:

South America's economic evolution will be accomplished in direct proportion to its use of automobiles. Except for Argentina, the growth of population in South American countries and the operation of their industries depend on good roads and automobiles. If 100,000 miles of good roads could be built in South America an unbelievably large market for American cars would be created.

Mr. Barrett then explained that in South America it is cheaper to build a highway that will stand automobile traffic than to build railroads that would furnish even a part of the service that the motor highway would afford. But development in South America is dependent almost entirely upon the facilities for securing loans to finance improvements, and he made a plea for automobile manufacturers to impress upon their bankers that the sale of automobiles and accessories below the equator can best be promoted by providing American dollars or equivalent credit. Fifty million dollars of surplus profits loaned to South America, he said, would return 50 per cent profit and aid the automobile industry to a degree that could not be estimated in figures.

THE MOTOR AND ACCESSORY MANUFACTURERS.

At the recent annual meeting of the board of directors of the Motor and Accessory Manufacturers the following officers were elected for the ensuing year: C. W. Stiger, president; Charles E. Thompson, first vice-president; E. H. Broadwell (vice-president of The Fisk Rubber Co., Chicopee Falls, Massachusetts), second vice-president; T. J. Wenzel, third vice-president; L. M. Wainwright, treasurer; Alfred P. Sloan, secretary and assistant treasurer.

The present board of directors consists of: C. W. Stiger, C. E. Thompson, T. J. Wenzel, E. H. Broadwell, L. M. Wainwright, Alfred P. Sloan, Jr., James H. Foster, E. W. Beach, Christian Girl, W. O. Rutherford, William C. Rands, William M. Sweet and L. M. Bradley.

The board of directors has agreed to sanction the exhibit in a body of a goodly number of members at the first Pan-American Aeronautic Exposition, to be held in the Grand Central Palace, New York City, February 8 to 15.

The annual banquet, accompanied by music and vaudeville, was held the evening of January 10 at the Waldorf-Astoria and pronounced an unqualified success, about 600 being in attendance. As usual, there was no speechmaking.

FIRST PAN-AMERICAN AERONAUTIC EXPOSITION.

The manufacture of aeroplanes has ceased to be a mere "game." It is now counted as one of our great American industries, and the importance and significance of the first Pan-American Aeronautical Exposition, to be held in the Grand Central Palace, February 8 to 15, can hardly be overestimated. Manufacturers of rubberized fabrics and miscellaneous accessories containing rubber will be numbered among the exhibitors, many of them members of The Motor and Accessory Manufacturers, whose coöperation and standardized products promise to make bulk production a feature as vital to the continued growth of this industry as it has been to the building of automobiles. The United States Government will also have an elaborate exhibit.

A few salient facts describe the meteoric growth of this new industry. Two aeroplane companies in America are now capitalized at over \$10,000,000, and 14 factories in this country employ over 10,000 men. Aeroplanes to the value of \$30,000,000 were built in the United States last year, and this year's business is estimated at \$50,000,000. The United States Government alone has appropriated \$35,000,000 for the purchase of aeroplanes for the Army, Navy and Post Office Departments.

The war has demonstrated the value of the aeroplane as an instrument of defense and developed its highly specialized construction for scout work, battle and transportation. In the latter field machines capable of lifting 15 tons and flying at a speed of 125 miles an hour have become a practical accomplishment. As a result of the war large numbers of men have trained for flying. There are about 1,000 aviators in America; France has over 5,000 and England over 40,000, while the total Royal Flying Corps of England is said to number over 40,000.

What the Rubber Chemists Are Doing.

VULCANIZATION TESTS.

EATON and Grantham's recent paper on "Variability of Plantation Rubber in Technical Mixings," abstracted in THE INDIA RUBBER WORLD last month, is discussed by Doctor H. P. Stevens in the "Journal of the Society of Chemical Industry" (November 30, 1916).

Doctor Stevens states that he is in general agreement with Eaton and Grantham as to the effect of introducing mineral matter or reducing the proportion of sulphur. The result is that the introduction of a few per cent of litharge almost obliterates the difference in the rate of cure between the fast and slow curing rubbers. The importance of litharge as an ingredient of technical mixings cannot be over-rated; possibly more than half the rubber goods manufactured contain litharge, and that is why some manufacturers use a mixing containing litharge for testing purposes.

Eaton and Grantham attribute the effect of litharge entirely to its action as an accelerator, but if this explanation were sufficient, magnesia should produce a similar effect. A better explanation is found in Doctor Stevens' research on the function of litharge in vulcanization [Journal of the Society of Chemical Industry, May 31, 1915, and THE INDIA RUBBER WORLD, August 1, 1915]. The conclusions there reached were: (a) That the addition of litharge in moderate quantities increases the coefficient of vulcanization; (b) that the maximum coefficient of vulcanization is obtained where there is just sufficient sulphur to cure the rubber fully and to convert all the litharge to lead sulphide and sulphate; (c) that increasing proportions of litharge cause a progressive reduction in the coefficient of vulcanization, a larger percentage of lead sulphide and sulphate being formed; (d) that the percentage of free sulphur drops suddenly at the point where the rubber is fully cured; (e) that even with large proportions of litharge a little free sulphur always remains.

If a simple relationship between the "optimum" cure and the correct cure be required *as a working hypothesis*, Doctor Stevens suggests that a geometrical relationship be adopted and to calculate the correct cure of the second sample by multiplying by the correct cure of the first and dividing by the "optimum" cure of the first.

IMPERIAL INSTITUTE VULCANIZATION TESTS.

Further investigations have been made at the Imperial Institute, London, on samples prepared in Ceylon by L. E. Campbell to determine the influence of various factors on the vulcanizing and mechanical properties of rubber. The subject is treated in full in the Department of Agriculture Bulletin, Ceylon, No. 24.

The following summary of these investigations is from "The India Rubber Journal" (December 2, 1916) and deals with the following:

(1) The effect of the form of the rubber, sheet, crêpe and block; (2) the effect of drying in air at ordinary temperature, in hot air and in a vacuum drier; (3) the effect of over-working the freshly coagulated rubber. Incidentally, comparison of rubber coagulated with acetic and hydrofluoric acid showed the former usually had the shorter time of vulcanization.

SUMMARY OF RESULTS.

The results recorded in this summary confirm those previously obtained in showing that plantation Para rubber is quite satisfactory in mechanical properties, the average tensile strength being fully equal to that of specimens of the best hard Para and the average elongation at the breaking point, only very slightly lower.

The chief variation is in the time required for correct vulcanization. There is no doubt from the results now available that

the conversion of the freshly coagulated rubber into crêpe lengthens the time of vulcanization, as compared with that of the corresponding sheet. In eleven comparative sets of specimens dealt with in this summary, the thin crêpe rubber had a distinctly longer time of vulcanization than the sheet, the figures ranging from 105 to 130 minutes for the crêpe and from 60 to 75 minutes for the sheet. It is noteworthy, too, that this lengthening of the time of vulcanization is brought about by passing the rubber through the rollers only five or seven times, and that additional treatment in the machine, up to 70 times through the rollers, has little further effect on the time of vulcanization. Thus the times of vulcanization of crêpe rubber passed through the rollers 7, 35, and 70 times were 113, 115 and 130 minutes, and the times for rubber treated 5, 25 and 50 times were 105, 115 and 115 minutes, respectively. The time for the control sheet was 75 minutes in each case.

Although the conversion of freshly coagulated rubber into crêpe has this marked effect on the time of vulcanization, the tensile strength is again shown to be but little affected, the difference in the breaking load of the sheet and crêpe being small. In the specimens previously dealt with the advantage in average tensile strength was invariably in favor of the sheet, but the crêpe may have the higher value, as is the case in four of the six sets of specimens.

The "over-working" of the freshly coagulated rubber in the washing machine had little effect on the tensile strength, or on the time of vulcanization. Rubber passed through the rollers 50 or 70 times differed only slightly in either of these respects from rubber treated five or seven times. The common opinion that the mechanical properties may be easily impaired by "over-working," does not receive support from the results of these experiments.

The conversion of thin crêpe into thick crêpe, by rolling several pieces together, did not produce any difference in the time of vulcanization, and the differences in tensile strength were not very marked or constant. The block rubber, made by compressing thin crêpe, had the same time of vulcanization as the latter, but in five out of six sets of specimens its tensile strength was a little lower.

The different methods of drying employed: (1) Air drying at the ordinary temperature; (2) drying in hot air; and (3) in vacuo, had very little effect on the time of vulcanization or tensile strength of the rubber.

RELATIONSHIP OF MECHANICAL TO CHEMICAL PROPERTIES.

Doctor D. Spence in "The India Rubber Journal" writes as follows on the relationship of mechanical to chemical properties of vulcanized rubber:

From experiments made there is no question that the combined sulphur at "optimum" cure in the case of *Hevea* plantation rubber is a remarkably constant quantity, equal on the average to approximately 2.8-3 per cent. Where more than this amount of combined sulphur has been found, either the method of vulcanization is at fault or the means of determining the "optimum" cure are inaccurate. In this connection it is necessary to point out that in the case of very soft, low-grade rubbers it is difficult to judge of the "optimum" cure, and there is always the tendency to increase the cure to beyond the "optimum" point in the hope of thereby improving the physical or tensile properties of the product. In the case of any good grade of *Hevea* plantation rubber there is no such difficulty, however, and where more than 2.8-3 per cent of combined sulphur is reported in this case, either the sample is over-cured, or what amounts to the same thing, vulcanization has not been properly carried out. With proper methods of vulcanization, and with the requisite experience in the judging of the proper cure, the combined sulphur at "op-

imum" cure should never greatly exceed the figures we have given. It should be pointed out, however, that if the time of cure required to produce the "optimum" result is extended, the chances are an increase in the amount of the combined sulphur at the "optimum" point over the figures we have given will be found; depolymerization, requiring an increase in cure to bring the rubber up to apparent physical "optimum" leads to an increase in the combined sulphur considerably over the amount which we have given. The rubber in this case is nevertheless over-cured, and where the vulcanization of the rubber is carried out scientifically, in a minimum of time, and with the least possible injury to the molecule, the combined sulphur at "optimum" cure will never be found to exceed 3 per cent.

Whether these figures obtain for rubbers of different botanical origin or not we have not sufficient analytical evidence at present to say. The constancy of this result is deduced from experiments made on *Hevea Brasiliensis* rubber only. The relation between the rubber and combined sulphur at correct cure is so constant that it is regarded as representing a more or less definite compound of rubber and sulphur to which a formula may be assigned on the assumption that partial valencies of the rubber aggregate have not all the same affinity for sulphur.

It may be of interest to record the fact that we have observed that the point at which the physical properties of pure balata on vulcanization suddenly change to more nearly resemble those of rubber, corresponds very closely with a combined sulphur content of 3 per cent. If pure balata is mixed with a little sulphur and a suitable catalyst, which is essential to its proper vulcanization, it will be found that when about 3 per cent of sulphur has combined with the balata, the physical properties of the vulcanized balata change from those of a hard inelastic product, more like hard rubber, to a pliant, semi-elastic product, more nearly resembling soft vulcanized india rubber. This phenomenon is exceedingly remarkable and interesting, as the transition point in the physical characteristics of balata on vulcanization occurs at about the same degree of chemical vulcanization as corresponds to the "optimum" cure of vulcanized india rubber. This has given rise to a number of experiments by us, with a view to converting balata into rubber and vice versa, some of which have led to exceedingly interesting results.

METHODS OF ANALYSIS.

EXAMINATION OF VULCANIZED RUBBER GOODS.

THE following methods are standard for the examination of vulcanized rubber goods as specified by the Board of Estimate and Apportionment of New York City.

The methods for free sulphur, mineral fillers, vulcanized rubber gum by weight, and vulcanized rubber gum by volume, have already been given in this department (August 1, 1915), and are here omitted.

PREPARATION OF SOFT RUBBER FOR ANALYSIS.

A sample of not less than 25 grains is made by taking pieces from various parts of the original sample. The backing of fire hose is buffed off before grinding; in all other hose separate samples of tube and cover are made without removing the backing or the friction compound. Other rubber goods containing frictioned fabric and rubber layers are ground up without removal of the adhering friction.

The sample is cut into small pieces and run through the grinder, taking for analysis only such material as will pass a 20-mesh sieve. The grinder should not become appreciably warm during the grinding. If the material gums together and cannot be sieved, it is simply passed twice through the grinder and all the material taken for the final sample. Crude rubber is cut with scissors.

A strong magnet is passed through the sample to remove any metal from the grinder and the thoroughly mixed sample is put

in tightly-stoppered bottles and kept not exposed to sunlight or heat.

Hard rubber is prepared for analysis by rasping.

ACETONE EXTRACTION.

Place a two-gram sample, which has been ground not more than 24 hours before, in an acetone-extracted paper thimble, and insert in a glass syphon cup under a condenser. Dry and weigh a clean 8 by 1¼-inch test tube, weighing between 20 and 40 grams, by means of a wire loop; pour in 50 cc. acetone, connect the apparatus, and extract continuously for 8 hours in such manner that the drops of condensed solvent will fall directly on the ground rubber; that the syphon cups will fill in 2½ to 3½ minutes; that the discharge of the syphon cup will not appreciably interrupt the boiling; that the condensed solvent will filter rapidly through the paper thimble, and that no fine particles of rubber or fillers will be carried over. If the solution in the cup is colored after eight hours' extraction, the extraction is continued for four hours the next day. Evaporate the acetone from the tube in a slanting position over live steam, wipe off the outside with a clean linen cloth, and dry to constant weight in a water oven at 95 to 100 degrees C., or until the weight increases, cooling in a desiccator. Calculate and record as "total acetone extract."

ORGANIC ACETONE EXTRACT.

When waxy hydrocarbons are not to be determined, subtract the percentage of free sulphur from the percentage of total acetone extract above, and record the difference as "organic acetone extract."

TOTAL SULPHUR.

A half-gram sample with six grams of potassium carbonate and four grams of sodium peroxide are mixed by rotating in a crucible; cover, heat at a low temperature over an asbestos shield to avoid sulphur fumes, until the mixture fuses, then bring to quiet fusion for 15 to 20 minutes. Avoid rapid heating and explosions. Rotate the melt while solidifying. When cool, put crucible and cover into a casserole containing 200 cc. of water, add five to ten cc. of bromine, and boil until the melt is dissolved. Allow to settle, decant, filter and wash through a thick filter with hot water. Acidify the filtrate with hydrochloric acid, using Congo red paper, make up the volume to 400 cc., and precipitate, boiling with 10 cc. of a 10 per cent solution of barium chloride, keeping the beaker covered with a watch glass. Allow the precipitate to stand over night, filter on an asbestos mat in a Gooch crucible, wash with hot water, ignite, and weigh, cooling in a desiccator. Calculate to sulphur (factor 0.1372) and record as "total sulphur."

OILY FOREIGN MATTER.

Where the presence of tar, pitch or asphalt is not indicated, spread out the rubber residue from the acetone extraction and dry in the water bath at 95 to 100 degrees C. until the odor of acetone is no longer apparent. Transfer to a 100 cc. pressure flask fitted with washers previously extracted with alcoholic potash. Add 50 cc. of alcoholic potash, stopper and heat in an air oven kept between 105 and 110 degrees C., for four hours. Cool the flask, filter and wash the residue with hot absolute alcohol until the washings are no longer colored. Make the filtrate strongly acid with concentrated hydrochloric acid to precipitate potassium chloride, allow to settle, filter and wash with hot chloroform into a small casserole. Place the casserole on the steam bath and evaporate until the odor of hydrochloric acid just disappears. Take up the residue with chloroform, filter and wash with hot chloroform into a weighed beaker, evaporate the chloroform on the steam bath and dry the residue in the water oven at 95 to 100 degrees C., in 15-minute periods, until the weight is constant, or increases, cooling in a desiccator. If the residue is not oily to the touch no report shall be made. If the residue is oily to the touch, subtract 2 per cent of the weight of vulcanized rubber gum, as determined below, from the cal-

culated amount found, and record the balance as "oily foreign matter."

TARRY FOREIGN MATTER.

If the compound is light in color, tar, pitch and asphalt shall be considered absent. If the compound is dark or black in color the residue after the acetone extract determination above, without removing the acetone, and before the alcoholic potash is made, is extracted with chloroform for four hours in the same manner and by the same procedure as for the acetone extraction. If the extract is very dark in color, or the residue is tarry, from its calculated amount shall be subtracted 3 per cent of the weight of vulcanized rubber gum, as determined below, and the balance recorded as "tarry foreign matter."

PRECAUTIONS.

When the chloroform extraction is made the day after the acetone extraction, the rubber residue shall be covered with acetone over night. When the alcoholic potash extraction is made the day after either the acetone extraction or the chloroform extraction, the dried rubber residue shall be covered with the alcoholic potash over night.

CARBONACEOUS FOREIGN MATTER.

Heat about one gram sample with 30 cc. of concentrated nitric acid and 15 cc. water. A black insoluble residue indicates the presence of carbon, as lampblack, graphite, etc. Examine the ground rubber under the microscope and observe the residue of fillers in the mineral fillers determination. If fibers or carbon are seen, except as a trace, proceed as follows:

The crucible containing the fillers is washed with hot dilute hydrochloric acid and hot water to decompose carbonates and sulphides, dried to constant weight at 105 to 110 degrees C., desiccating until cool. The crucible is then ignited to constant weight and the loss calculated and recorded as "carbonaceous foreign matter," and shall be subtracted from the percentage of "mineral fillers" recorded above.

SPECIFIC GRAVITY.

Make the determination on a strip or strips not less than five grams weight. Weigh to one milligram in air, then thoroughly wet with water, pressing and squeezing, with the fingers under water, to remove bubbles or films of air. Weigh to one milligram in water at 20 degrees C. (taken as 1.00), calculate to 0.001 and record as "specific gravity."

RATIOS.

Free sulphur and organic acetone extract are separately calculated and recorded as percentages by weight of vulcanized rubber gum present.

CHEMICAL PATENTS

THE UNITED STATES.

PHENOLIC CONDENSATION PRODUCT. A coating composition containing a phenolic condensation product and a cellulose ester, in conjunction with tetrachlorethane. [Whitney B. Jones, Perth Amboy, New Jersey, assignor to General Bakelite Co., New York City. United States patent No. 1,209,165.]

DENTAL RUBBER COMPOSITION. Dental plates made of finely ground vulcanized rubber compounded with raw rubber. The object is to neutralize the expansion of the one by the other during vulcanization. [S. G. Supplee and C. J. R. Engstrom. United States patent No. 1,204,609.]

THE UNITED KINGDOM.

VULCANIZATION AGENT. Nitrosophenols or their homologues, such as nitrosocresols or nitrosoxylenols, are used for facilitating the vulcanization of natural or artificial caoutchouc or caoutchouc-like substances. In an example, ten parts of sulphur and one part of nitrosophenol are used for vulcanizing 100 parts of rubber at a temperature of 135-145 degrees C. [S. J. Peachey,

Priestnall Road, Heaton Mersey, England. British patent No. 101,819.]

CEMENTING EBONITE. Parts of ebonite articles are cemented together by means of a solution of celluloid in amylacetate or other solvent. [C. A. Vandervell, Warple Way, Acton Vale, Middlesex, England. British patent No. 12,075 (1915).]

FIBROUS SHEET. Sheet material from fibers arranged substantially parallel is impregnated by a binding material; impregnation done in a vacuum. Multiple-ply stock, with cross layers of fibers, may be made from such material; and in that state is applicable to the manufacture of tires, hose, matting, belting, covers, heels and soles. [Rubber Regenerating Co., New York City. British patent No. 101,318.]

SWITZERLAND.

ELASTIC PRODUCT. A composition of gas tar, rubber, ordinary cement and mineral filling. The gas tar minus some of its oil is mixed with rubber dissolved in a solvent composed of benzene and carbon disulphide. This mass is liquified by heat, and cement and mineral filling added. The resulting mass is mixed and molded hot. [C. A. C. de Caudenberg. Swiss patent No. 73260, (Sept. 16, 1916).]

LABORATORY APPARATUS.

INSTRUMENT FOR MEASURING WATERPROOFING EFFECT ON FABRICS.

An instrument recently invented for measuring the impermeability of waterproofing on cloth has been described in the "Journal of the Society of Dyers and Colorists." The method

of measurement is based on the determination of the number of hammer strokes upon the cloth before the water percolates through, the cloth being pressed upwards by a column of water. The instrument consists of a copper cylindrical box A on the top of which is fixed by a ring, B, tightened with a screw C, the cloth to be tested. The pressure of water against the cloth is regulated by the movement of the wooden cylinder D in the glass reservoir E, on which the height of the water is marked in centimeters.

When the water is five centimeters high the hammer F is dropped. The hammer has a weight of three grams, which may be increased by a movable weight G. After the first stroke the water is raised one centimeter, and after every subsequent stroke it is raised again. The number of strokes required before the water appears on the surface of the cloth shows the degree of impermeability.

SULPHURIC ACID IN 1916.

Market conditions throughout the country are reported to have been on the whole better than in 1915, despite the somewhat higher value of the product. Reclaimers of rubber will be interested to know that according to reliable estimates by the United States Geological Survey the output of acids of strengths of 60 and 66 degrees amounted to nearly 950,000 tons, or practically the same as in 1915. The total estimated production of sulphuric acid, however, of strengths of 50, 60 and 66 degrees was 4,475,000 tons as expressed in terms of 50-degree acid, representing an increase of 600,000 tons or more than 15 per cent. The most notable feature in the sulphuric acid industry was the enormous increase in the production of acids of strengths greater than 66 degrees. The estimate shows a production of over a million tons as against less than 200,000 tons in 1915.

New Machines and Appliances.

A RUBBER MILL STEAM TURBINE.

THE reciprocating steam engine as a factor in the production of power for industrial purposes is now generally conceded to be almost negligible. True, there is occasionally found in modern plants that well-known type of reciprocating engine, the Corliss, which has dominated the field for many years.

Moreover, in modern practice its use is more or less sentimental and rather impractical, for the steam turbine has long ago proved its superiority in the production of power.

The engineering executives of the large rubber factories have not failed to appreciate the many advantages of the modern steam turbine, and several installations have been made in the larger mills. The accompanying illustration shows a steam turbine and generator in operation in the plant of the Firestone Tire & Rubber Co., Akron, Ohio. This turbine has a maximum capacity of 10,000 kilowatts [13,333 horse power]; the steam consumption is approximately 14 pounds per kilowatt, through a range of $\frac{3}{4}$ load to $1\frac{1}{4}$ load. The turbine is operating on 175 pounds steam pressure, 50 degrees superheat, and exhausting into a surface condenser under $28\frac{1}{2}$ -inch vacuum, and generating at 2,200 volts. The air for generator is passed through a modern type of air washer, thus giving very much lower temperature rise on the generator. [The General Electric Co., Schenectady, New York.]

A NEW THREE-WAY DELIVERY HEAD STRAINING MACHINE.

In reclaiming devulcanized rubber and the preparation of new rubber, particles of fiber, metal and other impurities are re-

moved by a mechanical straining process. Where large capacity that requires continuous, high-speed operation is desired the

three-way delivery type of straining machine is recommended.

The illustration is that of a 6-inch, self-contained strainer, equipped with motor-drive, automatic self-starter and stock-worm cooling device. It is built in accordance with the well-known excellence of design, material and workmanship characteristic of all Royle products.

The large straining area provided in this multiple head and the simplified straining parts that may be quickly interchanged are salient features in securing a maximum production. No less important is this specially constructed stock-worm and hopper proportionately designed to handle large quantities of material without clogging the machine.

To insure perfect alignment and efficient operation of the rapidly moving parts, the machine, out-board bearing and motor are mounted on a continuous bed-plate of substantial construction.

Rubber compounds vary in composition, requiring different stock-worm speeds in order that the maximum straining capacity may be attained at all times. This is obtained by a standard form of variable speed motor drive that is shown in the illustration. [John Royle & Sons, Paterson, New Jersey.]

HAND AND POWER BRUSHES FOR RUBBER WORKERS.

That brushes of various sorts are used in the rubber mills is generally accepted as a fact of comparatively minor importance. But upon investigating the subject it would appear from the variety of standard sorts in use, and the many types designed for special purposes,

that the brush problem in a rubber mill is by no means the least in importance.

There are, first, the hand brushes such as the counter, bench and floor brushes, that are made of good stock and in such a manner as to conserve their usefulness and not shed the bristles. Fine steel wire hand brushes with bristles of round tempered wire suitable for cleaning molds, cores and metal surfaces are made in accordance with the particular use for which they are intended.

Power brushes are of the rotary type and are principally used by tire manufacturers for roughening the casings before cementing and applying the tread. The bristles are of carbon steel wire and are made in sections which when worn out may be readily replaced. The complete wheels with brass or steel hubs are furnished in sizes varying from $6\frac{1}{2}$ to 15 inches in diameter and from $1\frac{1}{2}$ to 3-inch face. Of this type are the special rotary steel

brushes operated on a buffing stand or flexible shaft drive for cleaning tire molds and cores. They are made in different sizes and shapes with bristles soft or stiff according to the work required of them. Special rotaries are made as small as 3 inches and as large as 36 inches in diameter, with faces as wide as 6 inches.

The spreader brush is set up at the end of a spreading machine and is driven by chain gearing from the main drive. Its province is to dust the starch from the rubberized fabric as it passes

from the spreader to the wind-up roller. These brushes are made with soft bristles, about 8 inches in diameter and 48 to 70 inches long, depending on the width of the spreader.

There are, of course, other brushes that are included in the general list of factory supplies, but the foregoing types are of greater importance and therefore more interesting. [The Osborn Manufacturing Co., Cleveland, Ohio.]

THE ANDERSON FLOAT-TYPE STEAM TRAP.

The successful operation of vacuum chamber dryers, vacuum rotary dryers and fabric dryers used by rubber manufacturers and reclaimers for drying rubber and fabrics depends in great measure upon the efficiency of steam traps. A float trap, which has a greater capacity than is actually needed in order to take care of any variation, is usually specified. It is, moreover, advisable and almost necessary to have an individual trap on the steam line from each separate dryer; otherwise there will be back-pressure and the condensation will not drain properly. The heating element in vacuum chamber dryers, used in this country and abroad for drying rubber as it comes

from the washers, consists of hollow steel shelves. Steam passes into these shelves, and if any steam is condensed the water must be properly drained in order to make every square inch of the heating surface effective and to insure maximum and uniform drying of the rubber. The steam trap is placed underneath the dryer and connected with a special header that communicates with each of the shelves and drains any condensation that may collect.

Vacuum rotary dryers are used throughout the world for drying reclaimed rubber. They have a steam jacket in the outer shell, and concentric with a hollow revolving drum, also steam heated. A trap is provided for the steam jacket and a hollow shaft to remove the condensation.

Special fabric dryers are equipped with individual traps which operate in practically the same manner as those described in connection with vacuum chamber dryers.

The trap shown in the accompanying illustration is a typical float trap that is well and favorably known to the rubber trade. Its operation, briefly described, is as follows:

The condensed water enters the trap at the point marked "Inlet" and when sufficient accumulates to seal the valve with at least three or more inches of water, the float then raises and opens the valve, allowing the condensed water to escape at just the right rate to take care of the amount entering the trap, thus maintaining a water seal at all times.

After the trap has been in use a short time it is advisable, especially on new piping, to remove the sediment strainer and remove the accumulation of scale and chips.

The trap may be connected to several dryers with good results, provided a uniform steam pressure is maintained at all times. It is always advisable when making up a connection of

this kind to run the several drips into a large header and attach the trap to the header, which has the effect of equalizing the pressure to a certain degree and produces better results.

When the pressure varies to any extent in the dryers the one having the highest pressure will discharge freely and back up into those having a lower pressure, and the best results can be obtained only by attaching separate traps to those having lower pressure.

A very common trouble with steam traps is caused by low places or pockets in the piping system. Water accumulates in the low spots and is forced through into the trap at intervals, causing an uneven discharge. Where the quantity of accumulated water is sufficient and the steam valve in the line is opened suddenly this water is forced through the pipes at such a high velocity as to cause a water hammer which is very destructive to the whole piping system. [The V. D. Anderson Co., Cleveland, Ohio.]

MOTOR-DRIVEN TEST-PIECE GRINDER.

In making tensile strength tests of the rubber or fabric materials that are used in the construction of tires, hose, belting, etc., the sample should be absolutely uniform in cross section.

This is usually done on a small bench grinder with an abrasive wheel. The original machine of this type, designed primarily for grinding hose-lining test-pieces, was illustrated and described in THE INDIA RUBBER WORLD December 1, 1914.

The latest machine, shown in the accompanying illustration, has been improved to meet the requirements of modern rubber laboratory practice. The machine is direct connected to a ¼-horse-power electric motor and mounted on a continuous bed plate. The ends of the test-piece are clamped by eccentric rollers that hold the strip firmly against the platen. The platen is provided with hand-operated screws for vertical and transverse adjustments. The test-piece is ground by moving the platen longitudinally under the revolving emery wheel by means of the projecting handle and it is moved transversely by the cross feed handle shown in the illustration. [Emerson Apparatus Co., Boston, Massachusetts.]

TIRE MOLD AND CORE CLEANING MACHINES.

The mechanical progress that is being made in tire building follows closely the increasing demand for greater production of automobile tires. The hand labor of yesterday is rapidly becoming eliminated by modern time-saving machinery. The old, laborious method of cleaning tire molds and cores by hand may be superseded by the ingenious machines here shown.

Referring to the drawing, the base *A* supports the table *B*, on which rests the mold *C* that is to be cleaned. The table

and mold are rotated by an internal gear and pinion driven by worm gearing from the main drive shaft *D*, and controlled by a friction clutch operated by the treadle *E*. The large rotary wire brush *F* revolves in the lower end of a swinging arm *G*, and is driven by a belt from the main drive shaft *D*. The brush is moved laterally to accommodate different sized molds by a hand lever *H*.

TIRE MOLD CLEANING MACHINE.

The two small brushes *I, I*, are supported on arms that swing around the vertical shaft *J*, the angle of the brushes being adjusted by hand-wheel *K*. Adjustments for different mold sizes are obtained by worm gearing operated by hand-wheel *L*. All the mechanism is fulcrumed on the main drive shaft *D* so that the large and small brushes may be raised when placing or removing a mold on the table.

The core cleaning machine is mounted on a base *A* provided with housings *B* that support the main shaft *C*, upon which are fulcrumed the swinging arms *D, D*. The two belt-driven, rotary wire brushes *E, E*, are journaled in the ends of the swinging arms, and are held in a central position by a bracket, and adjusted by a right and left hand screw operated by hand-wheel *F*.

The core *G* is mounted on a carriage *H* that is moved backward and forward by a face cam *I*; meanwhile the core is being rotated by worm gearing *J*. A friction clutch operated by treadle *K* controls the movement of the core and carriage, while the brushes run continuously. Instead of mounting the core on the spider,

TIRE CORE CLEANING MACHINE.

two concave driving pulleys below, with one concave idler pulley above, may be utilized to drive the core, thereby avoiding the time necessary in chucking the core on the spider. Both mold and tire cleaning machines shown in the drawings are operated by belt-power. This, however, is optional, as motor drive may be installed with an additional cost that in most cases is deemed negligible. [R. W. Wheeler, Cleveland, Ohio.]

MACHINERY PATENTS.

AN OVERFLOW TRIMMING MACHINE.

THE object of this machine is to remove the surplus material from rubber or composition heels, soles and similar molded articles while in the molds. It is here shown in side elevation, mounted on a table *A*, upon which are placed the molds *B*, containing the articles to be trimmed. The rectangular frame *C* is supported on rollers that travel on tracks *D*, permitting movement across the table of the frame on which the carriage is mounted. The carriage comprises two parallel racks *E* and pinions *F*, driven by worm gearing *G* from the electric motor *H* by means of belt *I*. The trimming roller *J* is journaled in pivoted bearings, and adjustable to increase or diminish the friction of the roller in the trimming operation, and also to compensate for different mold thicknesses. The roller is covered with rubber, or any suitable abrading material may be used. It is driven by a crossed belt from the motor countershaft, and as the carriage traverses the table, the roller revolving in the opposite direction removes the overflow. Upon successive shifts of the frame at each traverse of the carriage all the rows of molds may be successively trimmed. [Harry D. Garber, Stoughton, Massachusetts, assignor to Plymouth Rubber Co., Canton, Massachusetts. United States patent No. 1,208,944.]

MACHINE FOR VULCANIZING HOSE IN CONTINUOUS LENGTHS.

The drawing is a side elevation showing the machine partly in section, mounted on end frames *A, A* that support the bearings *B, B*, of the hollow drum *C*, which is surrounded by a cylindrical, chambered jacket *D*. The contacting cylindrical faces of both the drum and jacket are provided with spiral grooves *E*, forming a continuous mold cavity for receiving the hose to be vulcanized in continuous lengths.

The jacket *D* is formed in two half-sections that the upper one may be removed when the hose is placed on the drum or when being removed after vulcanization, the lower section of the jacket being supported in the meantime by two jack screws *F, F*. To effect uniform curing the drum and jacket are rotated by the large gear *G*, driven by the motor *H*, the jack screws being lowered during this operation.

Connections for supplying steam to the interior of the drum and jacket are provided, also means for applying air under pressure within the hose during the vulcanizing operation. [Sarah D. Hewitt, Buffalo, New York. United States patent No. 1,210,938.]

A HORIZONTAL PRESS VULCANIZER.

The novelty in this vulcanizer as compared with the vertical type consists in accessibility of the operating parts and means for more quickly charging and discharging the tire molds. Moreover, the boltless molds are piped individually, permitting the use of inward or outward pressure in the vulcanizing process.

The drawing represents a side elevation of the apparatus, which consists of a horizontal heater *A*, and a train of press cars *B, B, B*, that are coupled together and moved in and out of the heater by an endless chain gearing driven by the motor *C*.

Each press car includes a platform mounted on flanged wheels, upon which the boltless tire molds are stacked. The under part of the platform is formed with a shallow cylinder of relatively

large diameter in which reciprocates a hydraulic ram. The mushroom-shaped press head *D* connects with the upper end of the ram by a screw joint so that it may be removed when the molds are being loaded or unloaded from the car.

In operation the press heads being removed, the molds are stacked on the cars and connected to the internal pressure supply line. The heads are then lowered, the stems traversing the interior of the mold stack, and screwed to the ends of the rams. Pressure is thus successively applied until the molds are completely closed, when the cars are run into the heater and pressure is applied to the interior of the tires. The vulcanizer head is then closed and the tires cured in open steam. [John R. Gammetér, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,210,926.]

TUBE MAKING MACHINE.

Inner tubes for tires or tubes for making rubber bands are made on this machine from a strip of uncured rubber sheet. The accompanying illustration, which is a side elevation of the machine partly in section, shows the frame *A* supported on suitable legs *B B*. The endless carrier belt *C* delivers the rubber strip *D* on to the machine and carries away the finished tube *E* at the back of the machine.

The tube forming strip is doubled and the edges are cemented by a device on the left not shown in the drawing. On entering the machine the strip is directed to a vertical plane by a guide *F* and then passed between vertical rollers *G*. On emerging, it is received between two horizontal rollers *H*, which flatten the strip in a horizontal plane with the cemented edges butted together. The tube then passes over a raised bed *I* and under four rapidly moving percussion hammers *J* which weld the edges of the tube together. Within the tube and directly under the hammers is a floating mandrel which separates the walls of the tube as it moves over the anvil. The tube then passes between the horizontal delivery rollers *K*, and deflected by idler roller *L*, it is removed from the machine by the carrier belt. [John R. Gammetér, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York. United States patent No. 1,210,455.]

SAFETY GUARD FOR WASHERS AND MILLS.

This invention has for its object an improved guard especially applicable to grinders, mixers and washers and which will afford

effectual means for preventing the hands of the operative being crushed between the rolls without interfering with the feeding of the material.

Referring to the drawings, the guard comprises a member *A*, con-

sisting of a length of wood, having attached to its ends triangular pieces *B*, whereby it is supported at an inclination on the side frames *C, C* in which the rolls *D, D* are mounted. Conveniently the triangular pieces *B, B* may be such that the member *A* lies at an inclination of about 45 degrees.

The two guards are arranged on the side frames *C, C* so that the members *A, A* incline outwardly with their lower edges approximately central of the rolls *D, D* and at an appropriate distance of about two inches, above the peripheries of the rolls. The spaces between the lower edges of the guards and the rolls are sufficient to permit the passage of a normal thickness of material under treatment. If the operator who is feeding the material to the rolls should pass his hands too far over the top of either roll, they will come into contact with the corresponding guard and his attention will thereby be called to the fact. [L. Gaisman and S. Dreyfus, both of Manchester, England, British patent No. 101,325.]

MACHINE FOR MOLDING HOLLOW RUBBER ARTICLES.

This machine forms hollow articles of rubber as doll bodies, rubber bulbs, etc. It is simple, easily adjustable, and can be controlled manually. By means of a hand lever attached to the vertical spindle the male die *A* can be raised or lowered. The two hinged portions forming the female die *B* are connected by toggle joints to the bases *C*, which are fastened to the lower platen *D* by set screws, or can be adjusted by screws *E*.

As the upper die is forced downward, the two segments of the lower die are forced together, and thus the article is shaped. As the upper die is released the lower one opens, due to the pressure of the spring *F*. The two dies can be changed very easily, and a variety of hollow objects may be produced. [Karl Jeffers, 44 Udestedtstrasse, Erfurt, Germany. German patent No. 638,713.]

PROCESS PATENTS.

THE MILLER CORD TIRE.

SEVERAL layers of rubber-impregnated cords are wound spirally around an annular core. The carcass is then slit on the inner circumference and removed to a second core on

which the tire is completed. The process consists in first applying a coating of cement to the core upon which the cords of the first-ply *A* are wound at a definite angle. They are spaced apart at the tread portion and nearly in contact along the inner circumference of the core.

A coating of rubber is then applied to the first ply and a second cord ply *B*, is laid on the first at a reverse angle. This procedure is repeated until a structure is built up having four alternately superposed plies, *A*, *B*, *C*, *D*, of cords embedded in rubber and arranged at reverse angles in respect to one another. The carcass is then slit and placed on a core where the tire is finished and subsequently placed in a mold and vulcanized under pressure. [Walter R. Denman, assignor to Miller Rubber Co.—both of Akron, Ohio. United States patent No. 1,210,434.]

MOLDING FOUNTAIN PEN BARRELS. A tube of unvulcanized rubber of the desired size and shape, containing a small quantity of water, is closed at each end by plugs of raw rubber. The tube is then inserted in a mold which is placed in a vulcanizer and the tube vulcanized in the usual manner. The heat converts the water within the tube into steam which forces the raw rubber

against the mold, giving the desired shape to the tube. [Herman Rickman, Butler, New Jersey. United States patent No. 1,210,842.]

THE ARCHER CORD TIRE.

The straight side casing is made up of inner transverse cords *A*, that fit within the intermediate longitudinal cords *B*, on which are superposed transverse cords *C*. The ends of the inner

cords are looped over cable strips *D*, formed by strips of frictioned fabric doubled around annular wire cables. The longitudinal cords *B* are interposed between the inner and outer cord layers. The outer transverse cords *C* are looped over cable strips *E*. In the clincher casing the inner cords are bulged inwardly and looped over an inner cable strip and then passed over the ends of the outer cords and looped over the outer cable strip. [Charles L. Archer, Minneapolis, Minnesota. United States patent No. 1,211,035.]

MISCELLANEOUS PATENTS.

A FRENCH PNEUMATIC WHEEL.

IN this wheel the pneumatic arrangement is placed in the hub. To the sleeve *A*, two annular disks *B* are attached and casing *C* forms an outside cover. To this are attached two disks *D* completely enclosing the hub. In this space is arranged a pneumatic cushion *E*, of suitable thickness (one or two centimeters at the utmost) and of variable diameter, enclosing an air tube *F*.

The spokes of the wheel are attached to the periphery of the hub, and the disks *B* and *D* may be four or more in number and attached alternately to the hub *A* and the cover *C*.

The pneumatic device is concentrically enclosed in the hub, and turns

with it and with the wheel. [J. Greppi and A. Romanach. French patent No. 481,036.]

New Goods and Specialties.

PINEAU'S CAPE COD PNEUMATIC LIFE SAVING BELT.

LIFE saving devices for use on the water have been invented in great number and variety for many years, but there still remains a place for a device affording adequate protection and safety without inconvenience to the wearer. In Pineau's Cape Cod Pneumatic Life Saving Belt it is claimed that this desirable combination of qualities has been effected. When inflated it contains enough air to float two people weighing 150 pounds each, and when not in

service it can be deflated, rolled into a compact package, and carried in the pocket or grip, taking up less room than an ordinary vest.

To those who cannot swim and like canoeing and boating it affords ease of mind without bodily discomfort, being readily adjustable to the body by side fastenings, and worn either under or outside the clothing. It is also a satisfactory aid in learning to swim, since it allows perfect freedom of the arms for any kind of stroke while preventing the novice from sinking below the surface of the water.

All sizes are furnished, up to 44 inches, the proper measurement being four inches larger than the chest, to allow for inflation. [Athol Manufacturing Co., Athol, Massachusetts.]

CREPE RUBBER FLOWERS.

Rubber lends itself readily to the life-like representation of flowers and other ornaments, and has been utilized in this manner for various purposes a number of years. A new departure is shown in this spray of Ascension lilies, fashioned from unvulcanized crepe rubber. This is but one of a large variety of reproduced blossoms. The slightly crinkled surface of this form of rubber aids in the realistic effect, and the

flowers, be they lilies, morning glories, poppies, hibiscus, or any other blooming plant, are tinted in the natural colorings. As hat trimmings, corsage bouquets, accessories for bathing costumes, etc., a surprising number of effective uses are found for these attractive novelties. [O. H. Hurley, New York City.]

PAPE "THERAPHONE" RECEIVER EARPIECE.

The improved earpiece here shown, when substituted on a telephone receiver for the ordinary earpiece, is claimed to render sound reproductions clear and natural instead of fatiguing, harsh

and confusing. The "Theraphone" earpiece is made of hard rubber, with a true diaphragm seat which prevents all rattling of the receiver membrane. The inverted trumpet-bell tone chamber does not

readily collect dust and dirt when the receiver is suspended from its hanger, and is therefore thoroughly hygienic. The radially fluted trumpet-bell ear chamber fits the ear comfortably and prevents the emitted sound waves from becoming muffled, and a rearward tapering periphery prevents the threaded portion of the earpiece from striking the table line when the receiver is laid on its side for waiting purposes. [The Evolution Phone Co., Inc., New York City.]

TIRE REPAIR PREPARATIONS.

"Pluggum" is the suggestive name for a soft, pliable rubber gum that is applied by simply kneading it into the cut in the tire with thumb and forefinger. It is claimed that this quick-repair gum will be permanently cured into place by the heat of the running tire. [The Miller Rubber Co., Akron, Ohio.]

A new rubber cement now on the market is claimed to be the only vulcanizing cement that dries in 30 seconds and that can be used either for cold patching or vulcanizing with a gasoline or steam vulcanizer in three minutes. Many preparations of this character lose their adhesive quality under the heat caused by the friction of the tube and casing when the car is running, but the slogan for "Vulcanite Cement" is "The Hotter It Gets the Better It Sticks." It is guaranteed not to be affected by either heat or cold and is suitable for repairing any article made of rubber. [Withrow Rubber Co., Grand Rapids, Michigan.]

MOISTURE-PROOF ATTACHMENT PLUGS.

The purpose of the rubber pieces here shown is to make possible the use of separable attachment plugs outdoors, without

danger of short circuiting when exposed to rain. The plug cap is set into the rubber casing and the rubber ring is mounted on the porcelain base just above the threaded portion, which screws into the socket, as indicated in the lower illustration. When the plug is inserted in the socket, the rubber ring is held tightly between the shoulder of the plug and the edge of the socket, making it impossible for any moisture to come in contact with the metal screw shell of either plug or

socket. The cap covered with the rubber casing is then inserted in the plug, making it thoroughly weatherproof. [Harvey Hubbell, Inc., Bridgeport, Connecticut.]

BALANCED WHIP GOLF CLUB.

As every player knows, the game of golf is not as easy as it looks, but requires the most practiced skill to attain any degree of proficiency. Every improvement in the accessories is eagerly sought by devotees of the game, but while the golf balls of to-day are much more resilient and better than those formerly in use, the chief improvement in clubs has been in the appearance and greater range of selection, the matter of distance and control remaining practically the same.

An interesting departure is shown herewith in a golf club embodying decided improvement in these qualities. A piece of rubber inserted in the shaft's upper half gives a controlled flexibility which makes it whip-only one way, in the direction the ball is driven, instead of up or down or in a circle, in the provoking manner of ordinary clubs. It is claimed that the perfect balance of this club makes it feel lighter and swing with greater freedom and more force, and this, together with the whip, enables the player to gain greater distance and accuracy. It is also said to prevent the breaking of the club at the head, and when played in the rough, striking stones or turf, the whip breaks the shock and almost invariably saves the club.

These clubs are made in a large variety of weights and styles, including all kinds, from driver to putter. [Balanced Whip Golf Club Co., New York City.]

HARD RUBBER SUBMARINE JARS.

A large percentage of the submarines used by the government has sulphuric acid batteries, and hard rubber jars are required to encase them. The accompanying illustration shows a number

of such jars that are made especially for the United States Government. They measure approximately 12 by 17 inches by 3 feet high, with walls $\frac{3}{8}$ of an inch thick. [The Luzerne Rubber Co., Trenton, New Jersey.]

FLOOR TREADS AND MOTOR-CAR COVERS.

The patent safety tread here shown consists of rubber blocks, vulcanized in galvanized steel, brass or other malleable metal plate and forming a raised pattern. For stair treads and office door mats this device is highly satisfactory, being neat in appearance, noiseless, and affording an absolutely safe foothold.

Waterproof motor-car covers are also furnished by the same

manufacturer which completely cover the car. These are supplied in black and drab proof sheetings, also blue, black or fawn Paramatta cloth. A canvas bag for packing the cover when not

in use is provided. [The North British Rubber Co., Limited, Edinburgh, Scotland.]

COMBINATION DASH AND TROUBLE LAMP.

In ordinary use, this device is a dash lamp, suitable for any car, to illuminate the speedometer, vibrator, clock, pedals, etc. The light is turned on and off by means of a two-way socket.

A threaded lock nut on part B holds the lamp head securely in the dash socket, preventing all rattle and wear of parts.

When desired, it can be converted into a trouble lamp by simply removing the lamp socket B from the dash socket C, using the ten

feet of cord fitted with Bayonet plug and socket. The plug A is then connected to the socket D on the dash and the other end to the reflector and lamp B.

These lamps are finished in nickel-plate, the lamp socket and plugs being made of hard rubber, forming the insulating material, and also supporting the metal plungers and metal contact points which complete the circuit with either the lamp bulb or the plug, as the case may be. [Metal Specialties Manufacturing Co., Chicago, Illinois.]

MARSHALL'S LINEMEN'S SHOE.

The lineman's calling is a dangerous one and its followers must be fully protected against electric shock. The shoe here illustrated is said to afford absolute protection, on the poles, on the ground, or in manholes, against pressure up to 20,000 volts. This shoe is vulcanized into a solid piece, will not peel nor come apart, and is not affected by oil, gasoline nor grease. The outer surface is of tough red rubber, the outer sole of white, wear-resisting, vulcanized tire-tread rubber. Above an insulated sole of red rubber extending two inches above the heel is a non-moisture absorbing cushion, and the lining of the shoe is embedded in rubber to prevent absorption of moisture. The shoe upper is made of "Standwater" mineral tanned leather, with no glue or grease used in the tanning process. This leather is claimed to be waterproof, current-proof and not affected by heat or cold.

Tests of this shoe in the laboratories of the Edison Electric Illuminating Co., of Boston, Massachusetts, under the direction of the National Electric Light Association, showed the following characteristics: Side of shoe, dry, punctured at 31,500 volts, and again at 34,000 volts; sole of shoe between electrodes in oil, punctured at 55,000 volts; 20,000 volts applied from salt water to salt water for one minute and 30,000 volts applied from salt water to salt water for 45 seconds did not puncture the rubber. [Linemen Protector Co., Detroit, Michigan.]

PERKINS' SPARK PLUG TESTER.

By means of this handy device, which is made entirely of hard rubber, defects in the action of spark plugs may be instantly located. The majority of automobiles have three or four different makes of spark plugs, and in many the plugs are not set at the proper gap and cause uneven running of the motor,

knocking and loss of power, with attendant evils such as heavy gas, oil and repair bills and a smoking car. The use of the tester produces the best results from the spark plugs, the procedure being as follows: See that gaps are set the same as the gap in the tester. Place the tester with one wire touching the terminal cap and the other wire touching the base of the plug. If the plug is operating as it should, a good spark will result, while a broken porcelain or fouled plug will not show a spark in the tester. [A. D. Perkins, New York City.]

PNEUMATIC SECURITY BOLT.

Although similar in part to the ordinary type of security bolt for pneumatic tires, the one here shown has the customary metal head with its under seat covered by canvas, this canvas being sealed by a piece of rubber and the two forming a pneumatic cushion which serves to hold the tube well out of the way of both bolt and outer cover when fitting. This special, patented form of security bolt is claimed greatly to minimize the risk in the operation of tire changing, that the covers and tubes will be nipped under the beads of the cover or under the security bolts. [The Self-Sealing Rubber Co., Limited, of Hermetic Works, Birmingham, England.]

A PNEUMATIC WHEEL.

A cushion wheel that disposes of the customary pneumatic tire and tube, comprises a solid tire that is cushioned on eight pistons operating in radial air cylinders. This air cushion wheel is recommended for all motor vehicles using solid tires and also for pleasure cars using pneumatics.

The solid tire is flexibly fixed to the radial pistons that automatically compress the air in the metallic air cylinders which are attached to the hub like spokes of a wheel. Thus it is claimed that the jars and jolts incidental to road travel are absorbed and riding quality obtained equal to that of a pneumatic tire. The tire is obviously immune from

punctures and blow-outs and moreover, it is said that the only attention required is an occasional drop of oil in the metallic air cylinders. [Pneumatic Wheel Co., St. Paul, Minnesota.]

"NEW GIANT" SINGLE-TREAD SOLID TIRE.

Trucks of six and eight-ton capacity demand tires of exceptional size, and the one here shown, measuring 42 by 14 inches, is claimed to be the largest single-tread solid tire ever built.

But size is not the only requisite. Of prime importance, and particularly considered in the construction of this tire, is the building and placing of the rubber in such form as will accommodate the internal stresses and displacement with the minimum friction. The resultant stresses within the distorted portion of the tire immediately affected by the load must also be taken into consideration. In the narrow-section solid tire these lateral stresses are relieved by the sides, but in the giant solid tire the sides are too widely separated for such relief. To meet this condition, the

"New Giant" has a series of grooves, scientifically arranged, encircling the outer periphery, thus making it analogous to a number of smaller tires with the additional advantage of all portions working on a single base. These grooves also tend to prevent skidding and assist tractive effort.

Some idea of the colossal size of this tire may be gained from the positions of the men in the picture. C. E. Speaks, manager of truck tire sales, standing beside it, and L. C. Clough, of the truck tire department, sitting within. [Firestone Tire & Rubber Co., Akron, Ohio.]

RUBBER IN THE FLOTATION PROCESS.

The flotation process of ore separation makes use of the affinity of finely ground sulphide ores for the froth produced by agitating a solution of water containing a very small proportion of an oil.

The sulphide ore is mixed with about 20 parts of the solution and run to cells where it is agitated either by mechanical means or by blowing air through a porous bottom. A number of substances and constructions have been used to form this porous bottom, but the most satisfactory so far, has been the cotton fabric diaphragm. However, the pores of this cotton fabric rapidly fill up and clog from the ore, and hence do not last long.

Rubber-coated diaphragms have been developed to eliminate the trouble experienced from the regular cotton fabric. It is made of one ply of coated fabric and two plies of regular untreated fabric, all stitched together in rows one inch apart in both directions. In the coated fabric, every thread is completely coated with rubber, but the fabric has been produced in such a way as to make it porous, and the small openings are the proper size to produce the froth required. These diaphragms are necessarily more expensive than the ordinary cotton fabric type, but the increased service is considerably out of proportion to the increased cost. [The B. F. Goodrich Co., Akron, Ohio.]

The Editor's Book Table.

THE CHEMISTRY AND TECHNOLOGY OF PAINTS. BY MAXIMILIAN TOCH. Second revised edition. D. Van Nostrand Co., New York City. [Large 8vo, 366 pages. Price, \$4.]

THIS standard work, which has passed through two editions, has been entirely rewritten and practically doubled in size.

It is an important work for manufacturers of paints, but is also of value to manufacturers of rubber goods because many of the materials described therein are used in the rubber industry. It is especially valuable for the chemist and the laboratory worker, inasmuch as it gives very complete directions for the analysis of many of the materials and solvents used in rubber compounding, the determination of relative purity, the detection of adulterations and the methods of manipulation in the manufacture. There are 83 microphotographs, as well as other illustrations. Valuable tables for conversion of French into English weights and measures, specific gravity of various materials, international atomic weights, and comparative thermometer readings, are also included. In all, the book is one which should find a place in the laboratory of every rubber factory.

Mr. Toch calls attention to the occasional employment of rubber in the manufacture of paint, a fact perhaps unknown to some rubber men. "In certain classes of mixed paints, particularly house paints which are made of corroded lead, sublimed lead, barium sulphate, etc., there is a likelihood or tendency of the pigment to settle. . . . To prevent this . . . a manufacturer feels the necessity of adding a combining medium . . . to prevent the paint from settling hard in the package. Among these are gutta percha solutions, solution of balata, Para rubber, gum chicle, etc. The rubber solutions mentioned serve their purpose very well without injuring the paint."

THE INDIA RUBBER, GUTTA-PERCHA AND ELECTRICAL DIARY and Year Book, 1917. MacLaren & Sons, Limited, London, England. [Large quarto, cloth, 150 pages.]

This annual publication which has been of great value to the rubber trade, not only in Great Britain but all other countries, appears this season in similar form to that of former years, and contains the usual statistical information which has made it so valuable in the past. The trade in rubber goods, both domestic and overseas, is carefully compiled and full statistics are given. The trade index is very extensive, occupying 30 or more three-column pages; the figures of the imports and reexports of rubber are given, and there follow the blank pages for the entry of transactions for each week day for the current year, besides several pages for miscellaneous memoranda. Instead of being interleaved with blotting paper as formerly, several loose sheets are furnished with the book, which is somewhat less bulky and fully as convenient for use. There are a large number of trade announcements, mainly of British rubber manufacturers.

GASOLINE AND HOW TO USE IT. BY G. A. BURRELL, Oil Statistical Society, Inc., Boston, Massachusetts. [281 pages, small 8vo, flexible leatherette binding. Price \$1.50.]

Mr. Burrell, who until recently was in charge of the research laboratory for gas investigations, Bureau of Mines of the United States Government, has performed a commendable work in bringing into this compact handbook a fund of information which is of value to every user of gasoline for motive power, as a solvent, for heating or lighting, for cleansing, or for any other purpose. Precautions for handling, directions for extinguishing fires, directions for detecting the presence of gas, are among the subjects treated, and a large portion of the handbook is devoted to the many points of interest to the automobilist, where engine troubles are treated, and practical directions for overcoming them are given. There is a short section on the use of benzene in the rubber industry. The present shortage of gasoline is con-

sidered, and a history of the petroleum industry embraces a short account of the many refining processes, including the modern "cracking" processes. The extraction of gasoline from natural gas, from shale, etc., is also described. Substitutes come in for description and consideration. Statistics, tables of specific gravity, atomic weights, and nomenclature of the Society of Automobile Engineers are added, making the little handbook a real *vade mecum* for gasoline users.

THE MAINTENANCE OF HEALTH IN THE TROPICS. BY W. J. SIMPSON, C.M.G., M.I., F.R.C.P. William Wood & Co., New York City. [16mo, illustrated, 174 pages. Price, \$1.35.]

American rubber men are instinctively turning toward the plantations of the Far East. Tours of investigation are more frequently chronicled; American capital is already invested in this industry, and more is soon to follow. Thus the American edition of this English publication could hardly have appeared more opportunely. As lecturer on tropical hygiene at the London School of Tropical Medicine, Dr. Simpson is well equipped to deal with this subject, which he has treated comprehensively and concisely in the present volume. The essential information has been presented with the fewest number of words. There are chapters on climate and personal precautions, diet, drinking water, dwelling houses, illnesses of the tropics and their prevention, with special chapters devoted to snake bites and wounds. With this book and the medical equipment advised no man of the north or south need fear for his personal well-being while sojourning along the equator.

NEW TRADE PUBLICATIONS.

THE footwear catalogs of the several factories of the United States Rubber Co. for the year 1917 follow in general style those of previous years, being of the long narrow shape, with handsome covers in colors, each with a distinctive design. They are fully illustrated with large half-tones of all the various styles of boots and shoes, thus, together with the printed descriptions, giving very satisfactory information regarding the goods made in each factory. After showing the styles, a department is devoted to illustrating the shapes of lasts, a side view and a sole view being given, some new shapes being added which are adapted to the latest styles of leather shoes they are intended to cover. The net price-list is given at the end of each book.

As stated above, the covers are distinctive and attractive, those of the Lycoming and "Goodyear Glove" factories bearing neat, well-drawn conventional designs which include the special brand and the U. S. trade-mark. The Boston Rubber Shoe Co. catalog is appropriately decorated with a picture of the Boston Tea Party; the L. Candee & Co. shows a bright lad in a lively shower; the American book pictures a *seringueiro* gathering latex; the Joseph Banigan Rubber Co. presents a couple of automobilists in a snowstorm; the Woonsocket Rubber Co.'s decoration is a fisherman in midstream; the Meyer Rubber Co. contributes a hunter in the wintry woods, while the Wales Goodyear catalog, true to its trade-mark, depicts a polar bear on a cake of ice, with the midnight sun in the background.

Besides these there are the usual net and gross price-lists of the above-named companies, and in addition, net price-lists of knit and felt boots of the Hastings Wool Boot Co. and the Medford Woolen Manufacturing Co., the list of miscellaneous goods, and a special catalog of the Everstick rubbers.

* * *

John Royle & Sons, Paterson, New Jersey, is mailing on request to interested persons a well-printed, 20-page, illustrated

pamphlet describing in considerable detail the Royle six-inch straining machine with the three-way delivery head, displayed elsewhere in this issue. The booklet also contains a summary of the Royle tubing machines, insulating machines and circular looms.

* * *

From the International Rubber Co., Denver, Colorado, we have received the first issue of "More Mileage," the firm's new monthly trade paper in the interests of International Rubber Half-Sole tires. Its bright reading matter and many illustrations reflect a "get-together" spirit among department heads and representatives that invariably makes for success.

* * *

From the B. F. Sturtevant Co., Hyde Park, Massachusetts, comes Binder B, substantially gotten up in red cloth with large titles in gold, in which to file 21 of the company's publications as issued, 7 of them already being in place. Firms having a large and varied product do well to standardize their publications in this manner for the convenience of their customers.

Those equipping rubber factory additions will find interest in the catalogs now available of Sturtevant air washers, Bulletin 226; Multivane volume fans, Bulletin 228; heaters, catalog 230; Autoforce ventilators, Bulletin 232; pneumatic collecting and conveying systems, Catalog 235, and electric fans, Catalog 240.

* * *

The Scientific Materials Co., Pittsburgh, Pennsylvania, has sent out "The Chemical Blue Book," a very valuable catalog and price-list of chemicals, acids and alkaloids, reagents, etc., which is likely to be of value to every analytical chemist and rubber manufacturer. This book gives a most complete list of chemical products handled by the company, containing as it does 4,000 different items with their synonyms, chemical formulae and processes. A list of international atomic weights is given, and added to this is a list of Kahlbaum's reagents, both English and German names being given. This company claims to have the largest stock of these reagents in the United States, and this is especially notable inasmuch as no more can be secured until after the close of the present European war.

* * *

Those of our readers who have not yet studied the Federal Reserve Act, or who do not fully understand the advantages and the workings of trade acceptances, will find a very informing and interesting explanation in the pamphlet "Trade Acceptances from a Mercantile Viewpoint," by Kenneth R. Hooker, vice-president and treasurer of the Putnam-Hooker Co., Cincinnati, Ohio. The pamphlet can be read in a short time, and gives a thorough explanation of the merits of this plan of merchandising and collections, applicable to all lines of business.

MORE CALENDARS AND SOUVENIRS.

IN addition to the calendars and souvenirs of which mention was made in the January issue of THE INDIA RUBBER WORLD as having been distributed to the rubber trade during the holiday season, it is a pleasure to acknowledge receipt of the following early in January:

SOUVENIRS.

Somerset Rubber Reclaiming Works, reclaimed rubber, Somerset, New Jersey. The most ingenious of the year's offerings, this consists of a white metal clip to hold a filler pad of perforated, detachable memorandum sheets $3\frac{1}{2} \times 4\frac{1}{2}$ inches, each bearing the legend: "What I Am to Do Today." To the thumb-piece of the spring clip is hinged a container for 12 monthly calendar cards beneath a celluloid-covered opening. Thus the calendar may be folded flat for mailing.

* * *

The Boston Woven Hose & Rubber Co., mechanicals, belting, packing, carriage cloth and hose, Cambridge, Massachusetts, distributed one of the handsomest souvenirs of the year. It consists of a 36-page octavo volume entitled "The Story of Rubber,"

and is artistically bound in green boards, printed on dull-finish coated paper, with many half-tone illustrations and several handsome inserts in full color, both on the cover and within the book. After describing what rubber is, how it is obtained, and reviewing the rubber industry and the growth of the Boston Woven Hose & Rubber Co., a journey through its great Cambridge plant is interestingly narrated. By word and picture a very good general idea is given the layman of the methods of manufacturing rubber hose, heels and soles, mats and matting, belting, fruit-jar rings and tape, together with a glimpse into the brass foundry where hose couplings and nozzles of all sizes and descriptions are made.

CALENDARS.

The Adamson Machine Co., rubber working machinery, Akron, Ohio. This displayed a beautiful hand-tinted photographic print, the subject being an attractive waterscape.

Boston Belting Co., belting, packing, hose and mechanicals, Boston, Massachusetts. An art calendar in tones of brown, depicting the Forsyth Dental Infirmary for children, donated to the city of Boston by Thomas A. Forsyth, president of the company.

David Bridge & Co., Limited, engineers and rubber machinists, Castleton, Manchester, England. Six sheets illustrating songs of long ago, each sheet having a humorous picture well printed in three colors on pebbled cream tinted paper. "We'd Better Bide a Wee," "The Wearing of the Green" and "The Gipsy's Warning" make particular appeal to the rubber trade.

Electric Hose & Rubber Co., hose, Wilmington, Delaware. Purely utilitarian in the form of a desk pad for memoranda.

The Rubber Regenerating Co., Limited, reclaimers, Trafford Park, Manchester, England. Its features were a daily tear-off pad and a reproduction in color of "The Passing Train," by Lucy Kemp-Welch, a painting of a plowing scene, with four splendid horses.

The Stamford Rubber Supply Co., rubber substitutes, Stamford, Connecticut. A large daily date calendar.

H. F. Taintor Manufacturing Co., whiting, Paris white, chalk, china clay, etc., New York City.

Tyson Brothers, rubber substitutes and chemicals, Carteret, New Jersey. This was the largest and handsomest calendar of the year, the illustration being a superb four-color reproduction of Moran's painting of the "Falls at Toltec Gorge in the Rockies," measuring $16 \times 22\frac{1}{4}$ inches.

Westinghouse Electric & Supply Co., electric motors and control devices, East Pittsburgh, Pennsylvania. A large calendar for practical office use.

CARDS.

Binney & Smith Co., lampblack, New York City.

Essex Rubber Co., mechanicals, hose, tires, tubes and accessories, packing, cements, sporting goods, heels and soles, Trenton, New Jersey.

Goodall Rubber Co., Inc., jobbers, Philadelphia, Pennsylvania. The season's greetings in the form of a blotter.

The Packard Electric Co., insulated wire, Warren, Ohio.

TRADE-MARK DECISION.

The examiner of trade-marks refused registration as a trade-mark the words "Para Oke—A. & A. R. Co. 100% Line," arranged in a circle, for shoe soles and heels, because of prior registration of the trade-mark of the American Rubber Co., which shows the word "Para" and "Boston" below a line on which appears the words "Rubber Shoe Co." for rubber boots and shoes. The court of appeals has decided that in view of the facts that, first, "Para" is descriptive of rubber, and probably of itself is not registrable; second, that the goods of the applicant and registrant are materially different; and, third, that applicant's mark involves its initials, together with the words "Para Oke," which apparently are not descriptive of the applicant's goods, applicant's mark may be passed to issue if no opposition develops.

Interesting Letters from Our Readers.

OCOTILLO VALUABLE AS A COMPOUNDING INGREDIENT.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—My attention was just called to the fact that a clearer explanation should be given about the uses of ocotillo gum, also a reply to the questions asked at the conclusion of the article that appeared on page 75 of the November issue of THE INDIA RUBBER WORLD. The exploitation of ocotillo gum reminds me of a similar experience that I had in 1907, when I worked out an insulating compound using mineral rubber known as No. 620 that answered the underwriters' specifications and kept the cost of the compound down.

In reference to ocotillo gum, L. B. Johnson, of Mesa, Arizona, asked my opinion of it, and I told him I could not give an answer until I had made a few experiments.

The experiments were very satisfactory, as the enclosed sample is a cement stock compound vulcanized 45 minutes at 40 pounds pressure, and composed of smoked sheet, ocotillo gum, M. R. X., zinc oxide, white lead, litharge and sulphur. I used 20 per cent of the ocotillo gum in the compound, and find that it vulcanizes without any objectionable features, as is often true of many new gums.

It provides an excellent gum to add to all friction stocks as it has the valuable power of causing the rubbers commonly used in friction stock to make a better union by penetrating the intricacies of the fabric. This is one of the very valuable characteristics of guayule, long known to the rubber trade.

At first rubber manufacturers did not look on guayule with favor, but today the opposite is true. Ocotillo gum, in conjunction with M. R. X., guayule and a good grade of automobile tire reclaim, produces a remarkably strong adhesive friction stock. Ocotillo has also been found to be a very valuable ingredient in the manufacture of a substitute for leather shoe soles for which there is a great demand; also in cements and repair stocks for automobile tires. Two tires are now in service retreaded with a tread stock compounded with 20 per cent of ocotillo gum and smoked sheet. One of these tires has traveled on the front wheel of a jitney bus over 5,000 miles; the other is on a private car.

Ocotillo gum cannot be used alone in the manufacture of this or similar goods, but it does possess the very valuable property of helping to make a better union, thus preventing separations in many cases, and it has a valuable part to play in the greatest of all businesses, the rubber industry.

E. W. SNYDER.

Los Angeles, California, December 19, 1916.

AN ALCOHOLIC POTASH EXTRACTION METHOD.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Your readers will perhaps be interested in my recent investigations indicating a satisfactory method to pursue when the analysis of vulcanized soft rubber is required for specification, or especially for compound analysis.

A known rubber compound containing 10 per cent sulphide, fatty substitute and 40 per cent rubber, the remainder being sulphur and mineral fillers, was taken for the experiment. As it is necessary to reduce the rubber sample to small particles in order to obtain correct results, this compound was first cut with a pair of scissors into the smallest possible pieces. After acetone and chloroform extraction it was boiled for four hours with normal alcoholic potash solution under a reflex condenser. The fatty acid was then determined in the usual way, and only 45 per cent of the total theoretically expected amount was obtained. Repetition of the same procedure with two more samples yielded simi-

lar results. Another was tried and also cut into small pieces with scissors as before, but was boiled for eight hours with normal alcoholic potash solution, when 56 per cent of the expected amount was obtained.

By taking the same compound, however, breaking it down carefully between mixing rollers, and sifting it through 32-mesh screens, 92.82 per cent of the theoretical value was obtained after acetone and chloroform extraction and boiling with the alcoholic potash solution for only three hours.

Passaic, New Jersey.

D. REPNY.

A MENACE TO THE BOLL WEEVIL?

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR Sir—In your January issue a correspondent writes that the boll weevil, advancing at the rate of 65 miles annually, has now covered half of Florida and threatens the Sea Island cotton crop of Georgia. He has overlooked the fact, however, that the latter state holds the record for annual number of lynchings. Sure and awful treatment is dealt out to pests of every sort; a punishment more terrible than the crime never seems to be wanting, and the boll weevil may well hesitate before penetrating far beyond the Florida boundary. Already the convention of Georgia, Florida and South Carolina cotton growers, to be held at Valdosta, Georgia, to-day, indicates an inclination on the part of the State Board of Entomology to take an active hand in giving this latest offender a warm reception.

Admittedly the boll weevil is a menace that must be fought energetically, but meanwhile let us be hopeful of the future.

OPTIMIST.

New York City, January 24, 1917.

ACCELERATED AGING TESTS NOT YET OF VALUE TO THE CONSUMER.

The stenographic report of E. A. Barrier's remarks on this subject before the Rubber Section of the American Chemical Society, as published in THE INDIA RUBBER WORLD of December 1, 1916, does not exactly agree with Mr. Barrier's opinions on this subject, and it is, therefore, a pleasure to give space to his corrected version which follows:

I am quite sure that every consumer wishes to get all of the cooperation he can from the manufacturer, but apparently this aging test is not yet in a condition where it will be of much value to the consumer. It is very evident that no definite conclusion can be drawn in general as to the probable life of rubber from the aging test. What the consumer wants is a test that is absolutely definite; if a sample shows up well after a few days' exposure, he wants to be sure that it will have a certain number of years of life.

As I understand it, in the accelerated aging test a sample may show good results in a ten-day test, but the ten-day sample may last a shorter time in service than a three-day sample. In other words, the test appears to be of value to the manufacturer where he is comparing compounds of the same type, but it does not seem to be of value to the consumer for general application.

There has been a good deal of discussion regarding this test in connection with insulated wire, and it may be that when used in conjunction with detailed specifications, such as those applying to this class of material, the test would be of value. The specifications call for certain chemical and physical requirements which limit the manufacturer to a considerable extent as to the character of compound which he can use. Under such conditions, where chemical and physical requirements are retained in conjunction with the aging test, it may be that the latter test is of value. On the other hand, it certainly is not clear that the aging test has developed to a point where it can be used as a substitute for the ordinary chemical and physical requirements which now generally appear in specifications. It is possible that a study of chemical tests on samples which have been subjected to the aging test will still further enhance its value.

The Obituary Record.

ONE OF THE OLDEST RUBBER MEN IN THE WEST.

JOHAN M. MILLER, for over 10 years manager of the St. Louis, Missouri, branch of the Goodyear Rubber Co., New York City,

J. M. MILLER.

died January 2 as the result of a paralytic stroke. The St. Louis store was opened over half a century ago under the management of George B. Thompson, who employed Mr. Miller as book-keeper 45 years ago. In 1906 Mr. Thompson died, and Mr. Miller, then assistant manager, became his successor. For 15 years past Mr. Miller has suffered from rheumatism, but his indomitable energy and desire to expand the business have kept him active. About six

weeks before his death a paralytic stroke confined him to his home, and he died upon the second occurrence.

Mr. Miller's long association with the trade had made for him many acquaintances and friends throughout the United States, all of whom will be glad to know that Fred Sheppard, president of the company, has appointed Paul Miller to succeed his father in the store which has been located in the same block on Fourth street for over 50 years.

A PIONEER IN RUBBER MANUFACTURE.

Colbee Osmond Benton, an old-time rubber manufacturer, died late in December at his home in Framingham, Massachusetts, aged 81 years. Mr. Benton was born in Lebanon, New Hampshire, June 21, 1835, and at the age of 19 entered the employ of the Canadian Rubber Co., at the time of its establishment in Montreal, Canada, having gone there with Messrs. Brown, Bourn, Chaffee, and Nathaniel Hayward. Mr. Benton realized the growing importance of the rubber industry, and devoted much time and study to compounds and processes. In 1863 he went to Manchester, England, and became superintendent of the West Rubber Co., manufacturing mechanicals and footwear. He later established the manufacture of mechanical goods at the factory of the Liverpool Rubber Co.

At that time poor health necessitated his return to his home in New Hampshire, and after two years' rest he became connected with the Boston Car Spring Co. in Boston, Massachusetts. In 1876 he commenced manufacturing sun-cured rubber garment cloth for the Conant Brothers of Boston, at first in Cambridge, Massachusetts, and then in South Framingham, Massachusetts, where a factory was built in 1877. It is said that he was the first man to use African rubber successfully in the manufacture of mechanical goods. In 1885, because of impaired health, he again retired for a time, but the next year associated himself with the Saratoga Rubber Co., at Saratoga, New York, but his health failing, he was forced to retire permanently, and for sev-

eral years past had been an invalid. Mr. Benton was a prominent member of St. Andrew's Protestant Episcopal Church at Framingham. His wife survives him.

FIRST TRAFFIC MANAGER OF A RUBBER COMPANY.

Frederick Russell Lyman, traffic manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, died of pneumonia January 7, at the age of 47. He had been employed by the Fisk company for the past 17 years, coming to it when it was in its infancy. As the originator of its traffic department, he was widely known among railroad men from coast to coast, and was a member of the Traffic Club of New York and the Hampden County Traffic Association. Mr. Lyman is said to have been the first traffic manager of a rubber company in the United States. Besides his wife and mother, he leaves two daughters, a sister and two brothers.

LONG A RUBBER FOREMAN.

J. Franklin Bates, for many years a foreman in the American Rubber Co. plant at Cambridge, Massachusetts, died in that city January 5, aged 62 years. His wife survives him.

JUDICIAL DECISIONS.

PANTHER RUBBER MANUFACTURING CO. v. J. T. S. RUBBER CO. This' cause in equity came up for a hearing upon a motion of the defendant to dismiss a petition of the complainant for a preliminary injunction to restrain it from manufacturing certain patented rubber heels. The defendant's ground for its motion was that claim No. 1 of the patent involved was not infringed by its (the defendant's) heel construction.

The complainant's patent was for "a rubber heel attachment for boot and shoe heels, consisting of a heel section or body molded to a concavo-convex form, and provided with a raised marginal portion and openings therethrough." It was held not infringed by rubber heels manufactured by defendant, which did not resemble in form those described in the complainant's patent. [The Federal Reporter, Vol. 334, page 377.]

MICHELIN TIRE CO. v. E. L. HEARN. Action by the Michelin Tire Co. against E. L. Hearn. Judgment for the defendant. Plaintiff appealed and decision affirmed.

This was a suit for an itemized account, based upon a contract covering a consignment of tires.

Hearn, being adjudged bankrupt, and granted a discharge in bankruptcy, claimed that this discharge included indebtedness on this account. Judgment was so entered. This decision on subsequent appeal was affirmed. [The Southwestern Reporter, Vol. 188, page 943.]

DE LASKI & THROPP CIRCULAR WOVEN TIRE CO. ET AL. v. UNITED STATES TIRE CO. This was an appeal from the District Court of the United States for the Southern District of New York, which decided for defendant in an equity suit by the De Laski & Thropp Circular Woven Tire Co., and the John E. Thropp's Sons Co. against the United States Tire Co. The Thropp patent No. 822,561, for an apparatus for manufacturing wheel tires, was held void for application by prior use. It was held, in this case, that the "date of invention" of a patented device is the date when the invention in its entirety, as patented, was conceived. The decree of the court below was affirmed. [The Federal Reporter, Vol. 235, pages 290 to 295.]

"Magmetco" is the name of a new brand of crimson and golden antimony recently offered to the rubber trade. It is manufactured by the Magnolia Metal Co., New York City, maker of the well-known Magnolia babbitt metal, and sold by the St. George Chemical Co., 99 John street, New York City. These brands are produced with 15-17 per cent free sulphur and also free of free sulphur.

TRADE NOTES.

The shop employes of the Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, maker of electric controlling devices, received Christmas presents in cash from the firm, and all of the 2,400 employes received a bonus of 10 per cent of their yearly wages or salary as a New Year's gift.

F. Bierman & Sons, St. Louis, Missouri, have recently moved into their new warehouse, which is 100 by 100 feet, contains three floors and basement, and is equipped with a sprinkler system, electric elevator and other convenient arrangements for the handling of their large trade in waste rubber, etc.

The A. & A. Rubber Co., Framingham, Massachusetts, has reorganized as the Archer Strauss Rubber Co., with increased physical and financial strength to meet the growing demands of its business in proofed fabrics.

J. H. Lane & Co. have been appointed sole selling agents of the Exposition Cotton Mills, Atlanta, Georgia. The mills manufacture sheetings and drills with 60,000 ring spindles and 1,550 looms.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, recently completed a very comfortably furnished hotel for its employes which will accommodate about 80 people.

The unsecured creditors of the S. & L. Rubber Co., Chester, Pennsylvania, have been paid a dividend of .06077 per cent, in full settlement of their claims.

The Hochschild-Kelter Co., Chicago, Illinois, importer of druggists' sundries, has reorganized under the name of The Hochschild-Walker Corporation, only a few members of the old company remaining with the new corporation. This concern is the exclusive distributor in the Central West for Tyrian automobile tires and tubes.

The McKnight-Sundries Co., Waco, Texas, importer and jobber of druggists' sundries and specialties, during 1916 increased its sales 61 per cent over the previous year, paying a 20 per cent cash dividend to stockholders.

The Imperial Rubber Co., New York City, has been voluntarily dissolved.

At a stockholders' meeting of The Simplex Rubber Co. of America, Inc., Ossining, New York, held December 29, for the purpose of passing upon a proposition for the sale of the assets, the reconstruction, consolidation or merger of the company with the Batavia Rubber Co., resolutions were adopted indicating the favorable attitude of the stockholders toward the affiliation of the two companies in question, and the details of further action were referred to the directors of the Simplex company.

H. F. Baker, of Hartford, Michigan, is seeking a patent on a substitute for hard rubber made from marl, a calcareous clay. This is subjected to a chemical process and is claimed to be an excellent substitute for hard rubber.

The I. T. S. Rubber Co., Elyria, Ohio, is adding several buildings to its plant. The company is a large producer of rubber heels.

The Manhattan Rubber Manufacturing Co., Passaic, New Jersey, announces the opening of offices at 318 Commerce Building, Erie, Pennsylvania, in charge of D. C. Ely.

The Vulcanite Manufacturing Co., Lindenhurst, New York, has increased its capital stock from \$100,000 to \$200,000, and is preparing to add to its plant.

Charles T. Wilson Co., Inc., New York City, has removed its offices from 46 Cortlandt street to 56 Wall street.

H. T. West Co., Inc., Boston, Massachusetts, dealer in chemicals, has removed from 40 Central street to temporary quarters at 113 State street, and on April 1 will be permanently located in the new Fidelity Building at 150 State street.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest, not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

[265.] A publication dealing with cost accounting as applied to tire manufacture is sought.

[266.] A correspondent wishes to know where machinery for coagulating and washing plantation rubber may be purchased.

[267.] We have received an inquiry for soft rubber disks about $\frac{3}{8}$ inch in diameter by $\frac{3}{16}$ inch thick.

[268.] A machine which will separate rubber from canvas is sought.

[269.] A foreign subscriber seeks information concerning American manufacturers or importers of accelerators for the vulcanization of rubber.

[270.] A correspondent wishes to know where he can obtain organic accelerators, including hexamethyl-tetramine and thio-carbanilide.

[271.] Names of manufacturers of toy rubber balls, dolls and animals are requested.

[272.] Names of firms who build or lease tire-building machines have been requested.

[273.] A correspondent wishes to be advised of manufacturers of machinery required for the weaving of cotton fire hose fabrics.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Samples and prices of rubber heels are desired by a man in Spain. Report No. 23,391.

A merchant in Spain desires to purchase rubber sponges. Report No. 23,393.

A shoe factory in Switzerland desires to purchase 10,000 rubber heels in various sizes and qualities. Report No. 23,409.

A merchant in Spain wishes to secure an agency for the sale of rubber goods, especially automobile tops and inner tubes. Report No. 23,410.

A firm in Switzerland wishes to purchase red and black, hard, vulcanized fiber for the manufacture of pocket knives and cutlery. Report No. 23,505.

Representation of American manufacturers and exporters of pneumatic tires and rubber sponges is desired by a man in Spain. Report No. 23,518.

An agency for the sale of rubber goods is desired by a man in Argentina. Report No. 23,480.

WESTINGHOUSE WELFARE WORK.

The Westinghouse Club, at the plant of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, is a remarkable institution. Organized in 1902 primarily for the benefit of technically trained students, this class predominates, although membership in the club is now open to any factory employe. The present membership, recruited from all of the Westinghouse companies in the Pittsburgh district, is now about 850.

The club is operated by a board of directors, three of whom are appointed by the company and three elected by the members, and a paid manager and assistant manager are employed to devote their entire time to the club. Specially appointed committees handle the varied activities, one of the most important being regular classes for the systematic study of the theory, design and application of the Westinghouse apparatus. The 65 by 140-foot gymnasium affords exceptional facilities for athletics; there is a valuable library, and entertainments and lectures bring the members together and increase their happiness and efficiency.

GUTTA PERCHA & RUBBER, LIMITED, CHANGES.

W. G. Fowler has been made manager of the Pacific division of Gutta Percha & Rubber, Limited, Toronto, Canada, and will have his headquarters in Vancouver, British Columbia. Mr. Fowler has been with the company for about 25 years, acting as manager of the Alberta division, with headquarters at Calgary, ever since that branch was opened.

W. R. Wayman has been appointed manager of the Calgary branch.

H. R. Hamilton, formerly manager of the Eastern division, with headquarters at Montreal, has been transferred to the head office at Toronto and appointed assistant manager of the shoe department. R. B. Reid succeeds Mr. Hamilton as manager of the Eastern division.

H. D. McWhirter, former manager of the Central division, with headquarters at Winnipeg, has been appointed manager of both the Central and Alberta divisions, and C. N. Larsen, assistant manager of these divisions.

George Tait, who has completed 25 years of service with the company and who, for many years past, has been manager of the fire hose department, recently celebrated his seventy-third birthday. Mr. Tait has now retired from business on pension.

STUNGO-RADIUM RUBBER CO. BUYS PLANT.

The Stungo-Radium Rubber Co. has purchased a plant at Washington, Pennsylvania, which affords a practically new factory building, 500 feet long and 125 feet wide, with the entire ground floor of steel and concrete construction, and a separate power house, equipped with two 300-horsepower Erie boilers with patent stokers and Sturtevant blowing system for pure air and proper ventilation.

The company will manufacture rubber goods of all kinds, but will specialize in pneumatic automobile tires and solid and cushion truck tires. United States patents have been acquired for the Stungo Special Automobile Tires constructed upon a secret system for which exceptional merits are claimed.

Joseph Stungo, widely known in England and Scotland as a tire expert and technical engineer, will have direct supervision of the entire mill. Employment will be given to 500 mechanics.

BRUNSWICK COMPANY BUILDS WORKMEN'S HOMES.

The large factory of the Brunswick-Balke Collender Co., at Muskegon, Michigan, is rapidly nearing completion and will bring a thousand new workmen from all parts of the country, increasing Muskegon's population by about 4 per cent. The Brunswick company is planning houses for its workmen and to provide for immediate necessities 48 double houses, each of a different pattern, are now being built. Each separate unit will have a large porch, six rooms and a bathroom, and the homes will be sold to the workmen at actual cost, on the easiest terms.

THE NATIONAL RUBBER CO.

James A. Murray is to become president and general manager of the National Rubber Co., Pottstown, Pennsylvania, having resigned his office as vice-president and general manager of the Seamless Rubber Co., New Haven, Connecticut. Mr. Murray will locate in Pottstown permanently in March. In his new position he succeeds Jacob G. Feist, who at the reorganization of the board of directors in February will be named as treasurer.

This change is necessitated by the rapid growth of the National company and is intended to relieve Mr. Feist and allow him more time for outside management. Operations have already begun in the new concrete building of the company and a business of approximately \$4,000,000 is anticipated during the year 1917. There will be no changes in the working force, William C. Walsh being retained as superintendent.

CRUDE RUBBER BROKER EXTENDS ACTIVITIES.

Charles E. Wood, crude rubber broker, with headquarters at 24 Stone street, New York City, has recently had occasion to increase his office space, not only in New York, but in the Hamilton building, Akron, Ohio, as well.

He has also augmented his staff at both points, the new acquisition on the New York end being Drew McKenna, for 15 years

D. McKenna.

W. M. Korhammer, Jr.

connected with The B. F. Goodrich Co. Mr. Wood feels that this addition to his organization will not only promote the development of an already progressive enterprise, but will enable him to increase the efficiency of his service to his clients.

The new member of the Akron staff is W. M. Korhammer, Jr., who for a number of years has been in the electrical business, and has severed his connections with the Western Electric Co., of New York City, to accept the position with Charles E. Wood.

PERSONAL MENTION.

J. A. McKenzie, manager of the Victoria, B. C., branch of the Canadian Consolidated Rubber Co., Limited, Montreal, Canada, recently returned from a six months' trip in Australia and New Zealand.

At a meeting of the Rhode Island Shoe Retailers' Association in Providence, Rhode Island, early last month, E. B. Pearson, manager of sales of the Converse Rubber Shoe Co., Malden, Massachusetts, was the speaker of the evening, discussing the cost of rubbers and the reasons for the advance in prices.

A. J. Pennington is in charge of the tire plant of The Brunswick-Balke-Collender Co., Muskegon, Michigan, and M. J. Whalen is in charge of the hard rubber department.

J. R. Gemmill is now in charge of the Chicago, Illinois, branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania.

E. W. Openshaw, for several years connected with the molded goods department of The B. F. Goodrich Co., New York City, is now with the Hewitt Rubber Co., Buffalo, New York.

M. B. Clarke has resigned as superintendent of the druggists' sundries department of the Gordon Tire & Rubber Co., Canton, Ohio, and the duties of C. W. McKone, superintendent of the tire and tube department have been extended to include the druggists' sundries department.

E. M. Waldo, of the firm of E. M. & F. Waldo, colors for rubber compounding, New York City, is in England for several weeks arranging for supplies of certain products sold by his firm.

NEW INCORPORATIONS.

Advance Rubber Co., January 16 (Delaware), \$2,000,000. F. D. Buck, George W. Dillman, and M. L. Horthy—all of Wilmington, Delaware. Principal office, Delaware Charter Guarantee & Trust Co., 328 DuPont Building, Wilmington, Delaware. To deal in tires, tubes and automobile accessories, etc.

Akron Biltwell Tire & Rubber Co., The, December 27 (Ohio), \$200,000; M. Braley, J. F. Risch, W. H. Kline and W. A. Young. Principal office, Akron, Ohio. To manufacture tires and accessories.

Archer-Strauss Rubber Co., January 4 (Massachusetts), \$100,000. Aaron L. Strauss, 16 Browne street, and Albert Gutterman, 77 Browne street, both in Brookline, Massachusetts, and Calvert B. Archer, 45 Irving place, Framingham, Massachusetts. Principal office, Framingham, Massachusetts. To manufacture and deal in rubber and rubber products.

Automatic Top Sales Corporation, The, January 6 (New York), \$500,000. Donn Wood, Thomas H. Smith, and Baylis M. Dawson—all of 10 Wall street, New York City. Auto top business.

Auto Tire Exchange, Inc., January 12 (New Jersey), \$100,000. Herman Lefkowitz, 127 Johnson avenue; Leo Kaplus, 129 Johnson avenue; Morris E. Rothhouse, 173 Morris avenue—all of Newark, New Jersey. Principal office, 225 Halsey street, Newark, New Jersey. To manufacture and deal in tires, tubes, etc.

Balanced Whip Golf Club Co., Inc., December 1 (New York), \$15,000. Rufus P. Johnston, president and treasurer; P. H. Lynch, vice-president; George N. Vanderbilt, secretary. Principal office, 103 Park avenue, New York City. To manufacture the Balanced Whip Golf Club.

Brooklyn Rubber Works, Inc., January 16 (New York), \$5,000. Axel Larson, 168 East 112th street, New York City; Frederick S. Lafond, Jr., 1117 Carroll street, and Theodore A. Deveer, 28 Boerum place—both in Brooklyn, New York. Tires, etc.

Great Republic Tire & Rubber Manufacturing Co., January 15 (Delaware), \$100,000. W. H. Owens, Denton, Texas; K. M. Dougherty and E. Lynch—both of Wilmington, Delaware. Principal office, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires, inner tubes and other rubber products.

Hagberg Automobile Co., January 5 (Kansas), \$150,000. C. A. Hagberg (president and general manager), F. L. Fraser (secretary and treasurer)—both of Wichita, Kansas, and R. E. Newberry (vice-president and sales manager). Principal office, Wichita, Kansas. To manufacture and deal in rubber goods, automobile supplies, accessories, etc.

Henry's Tire Shop, December 5 (Oregon), \$5,000. John T. Henry, John Henry and R. H. Cochrane—all of 82½ North Broadway, Portland, Oregon. Principal office, Portland, Oregon. To deal in tires, etc.

Independent Tire Co., December 27 (Tennessee), \$6,000. F. F. Cain, M. E. Cain and A. B. Hatch. Principal office, Memphis, Tennessee. To deal in auto tires and accessories.

Manufacturers Tire & Rubber Co., Inc., January 9 (New Jersey), Eric Windmiller, 43 High street, Passaic; Herman Feder, 335 Belmont avenue, Newark, both in New Jersey, and Justin S. Galland, 25 Broad street, New York City. Principal office, 335 Belmont avenue, Newark, New Jersey. To manufacture machinery, tires, rubber goods, etc.

National Compo. Co., Inc., December 26 (New York), \$5,000. Jacob Meisel, 752 Broadway; Paul R. Gordon, 149 Broadway, both in New York City, and Abraham Litzy, Newark, New Jersey. Insulating materials, etc.

North Star Rubber Co., October 20 (Minnesota), \$50,000. Jeremiah C. Spillane, J. W. Laramy and Samuel H. Greeley, all of St. Paul, Minnesota. Principal office, St. Paul, Minnesota. To manufacture rubber products.

Olsen, Wilson & Stendicke, Inc., January 4 (New York), \$15,-

000. Albert Olsen, 427 East 158th street. William J. Wilson, 511 West 143rd street, and Richard A. Stendicke, 173 East Seventy-fourth street, all in New York City. To deal in auto tires, tubes, etc.

Peerless Tire & Rubber Co., January 5 (Wisconsin), \$50,000. F. E. Burrall, John P. Jessen and A. W. Brown, all of Green Bay, Wisconsin. Principal office Green Bay, Wisconsin. To manufacture and deal in tires, rubber goods, etc.

Samson Tire & Rubber Corporation, January 12 (Delaware), \$1,000,000. James M. Satterfield, L. B. Phillips and J. B. Bailey, all of Dover, Delaware. Principal office, United States Corporation Co., 311 South State street, Dover, Delaware. To deal in tires, etc.

Security Tire & Rubber Co., December 27 (Delaware), \$1,000,000. V. C. Bogardus, H. H. Waller and M. Friedberg, all of 140 Nassau street, Manhattan Borough, New York City. Principal office, Capital Trust Co., of Delaware, Dover, Delaware. To manufacture and sell inner tubes for automobile tires.

Stearns Tire & Tube Co., Inc., December 26 (New York), \$250,000. A. K. Ott, 518 West 161st street, New York City; Henry Pearlman, 2038 Eighty-fifth street, and M. Hawthorne, 1221 Fifty-fourth street, both in Brooklyn, N. Y. To manufacture tires, tubes, etc.

Tire Co. of America, December 12 (Wisconsin), \$2,000. Edward Ver Halen, John Gregory, and E. H. Ludwig. Principal office, Milwaukee, Wisconsin. To manufacture and deal in tires, etc.

Titan Tire & Rubber Co., Inc., January 17 (New York), \$1,200,000. Horace D. Newman, 329 West Forty-eighth street; John J. Gray, 309 East Seventeenth street, both in New York City, and J. Gerald Kenlon, Goytesville, New Jersey. Principal office, Batavia, New York. To manufacture rubber goods.

Utica Tire Exchange Co., Inc., January 13 (New York), \$5,000. Monzo Hand, Vernon; N. F. Hand and Earl G. Becker, 49 Franklin Square, Utica, both in New York. Principal office, Utica, New York. To deal in tires.

Washington Waterproof Clothing Co., Inc., January 8 (New York), \$10,000. Benjamin Jacobson and L. Jacobson, 1338 Forty-fifth street, Brooklyn, New York, and Hyman Cohen, 611 West 113th street, New York City. To manufacture rubberized clothing, etc.

RUBBER COMPANY SHARE QUOTATIONS.

The following market quotations of shares of rubber manufacturing companies on January 24 are furnished by John Burnham & Co., 115 Broadway, New York City, and 41 South La Salle Street, Chicago, Illinois:

	Bid.	Asked.
Avax Rubber Co. (new).....	76	77½
Firestone Tire & Rubber Co., common.....	140	145
Firestone Tire & Rubber Co., preferred.....	107	108½
The B. F. Goodrich Co., common.....	59½	60½
The B. F. Goodrich Co., preferred.....	111	112
Goodyear Tire & Rubber Co., common.....	278	282½
Goodyear Tire & Rubber Co., preferred.....	107½	108½
Kelly-Springfield Tire Co., common.....	59¾	60
Kelly-Springfield Tire Co., 1st preferred.....	92½	95
Miller Rubber Co., common.....	248	255
Miller Rubber Co., preferred.....	107½	108½
Portage Rubber Co., common.....	164	166
Rubber Goods Manufacturing Co., preferred.....	110	..
Swinehart Tire & Rubber Co.....	84	87
United States Rubber Co., common.....	59½	60¼
United States Rubber Co., preferred.....	110	111

RUBBER COMPANY DIVIDENDS.

The Besaw Tire & Rubber Co. paid a dividend of 7 per cent on all preferred stock from date of issue to January 1, to stockholders of record on that date.

The board of directors of the United States Rubber Co. has declared a quarterly dividend of 2 per cent on the first preferred stock and a quarterly dividend of 1½ per cent on the second preferred stock, payable January 31 to stockholders of record January 15.

The Kelly-Springfield Tire Co. has declared a quarterly dividend of 4 per cent on the common stock, payable February 1 to stockholders of record January 15.

PERSONAL MENTION.

John Clinton, formerly connected with the Boston, Massachusetts, office of the Firestone Tire & Rubber Co., Akron, Ohio, has been given charge of the company's branch at Buffalo, New York.

G. K. Meeks has been placed in charge of the Wichita, Kansas, branch of the Firestone Tire & Rubber Co., Akron, Ohio.

J. C. Withers succeeds W. I. Fornof as manager of the Nashville, Tennessee, depot of The B. F. Goodrich Co., Akron, Ohio.

John L. Butler has been appointed advertising manager of the Pennsylvania Rubber Co., Jeannette, Pennsylvania.

John B. Maus, export manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, recently returned from a trip through Porto Rico during which he made a close study of conditions there. He finds motoring on the increase, with American cars used exclusively. City streets are narrow but country roads excellent, although hard on tires.

Jesse E. LaDow, of the Mansfield Tire & Rubber Co., Mansfield, Ohio, has been deeply impressed by the exceptional economic and industrial conditions in Japan. Further observation of the growing rubber industry there, its manifest advantages of cheap labor, excellent shipping facilities and proximity to the source of crude rubber, has again led him to write interestingly to several American newspapers, this time from Osaka, advocating an American import tax on all foreign manufactured rubber goods based for each country upon the difference between the cost of labor there and in the United States, plus the increased cost of crude rubber here. This he believes would effectually protect both capital and labor in America.

During the past month, Henry S. Marlor, general superintendent of the Goodyear Tire & Rubber Co., at Williamsport, Pennsylvania, married Miss Mildred Sutton Ward, daughter of Mr. and Mrs. James Henry Ward and great-granddaughter of Cornelius Vanderbilt.

C. A. Jessup has succeeded P. G. Frazier as manager of the St. Louis, Missouri, branch of the Kelly-Springfield Tire Co.

Richard H. Newell, for the past six years connected with The Fisk Rubber Co., Chicopee Falls, Massachusetts, as chemist, is now superintendent of the Dreadnaught Tire & Rubber Co., Baltimore, Maryland.

George M. Martin is in charge of the new branch of the Kelly-Springfield Tire Co., at Minneapolis, Minnesota.

George C. Van Veen has been appointed manager of the newly opened branch of The Mason Tire & Rubber Co., Kent, Ohio, at 1732 Grand avenue, Kansas City, Missouri.

FIRESTONE PROMOTIONS.

Dan C. Swander, formerly eastern district manager of the Firestone Tire & Rubber Co., Akron, Ohio, and one of the company's most energetic workers, has been appointed manager of the Boston branch. L. G. Fairbank has succeeded him as eastern district manager.

C. E. Speaks, formerly manager of the cycle tire department, has been made manager of truck tire sales, being succeeded in the cycle tire department by Henry E. Haws, formerly assistant manager.

W. J. Slater, formerly manager of the sales promotion department, is now special representative of the general sales department, Sherman L. Lewis succeeding him as sales promotion manager.

Salesmen recently promoted to branch managerships are: M. M. Whorley, Syracuse, New York; G. K. Meeks, Wichita,

Kansas; Milton Van Keuren, Albany, New York; A. C. Searle, Minneapolis, Minnesota; H. C. Buchanan, Charlotte, North Carolina.

NEW FISK APPOINTMENTS.

Fred H. Ayers has been placed in charge of the sales organization of The Fisk Rubber Co., with headquarters at the general offices at Chicopee Falls, Massachusetts. Mr. Ayers is well known in Eastern tiredom, having been with the Fisk company since 1905. In 1909 he became manager of the Boston, Massachusetts, branch, and when the sales organization was divided into districts five years later, he was given supervision of all the company's branches in New England and New York State, east of Buffalo, last July becoming supervisor of districts. George T. Newton succeeds Mr. Ayers.

F. H. AYERS.

W. H. Barcus, for two years in charge of the Fisk branch at Cleveland, Ohio, has been appointed manager of the newly created Cleveland district, which embraces the company's branches at Cleveland, Toledo, Lima, Columbus, Youngstown, Dayton, Cincinnati and Pittsburgh.

E. J. McMartin, formerly branch manager at Butte, Montana, will have charge of the district about to be created, which includes the branches at Butte, Great Falls, Billings, Salt Lake, Rapid City, Minot and Bismarck.

Roy L. Sergeant, for the past two years in charge of The Fisk Rubber Co.'s interests in the southern end of California, has been placed in charge of the company's business for the entire Pacific Coast territory, with headquarters in San Francisco.

GOODYEAR CHANGES.

F. F. Tilden has been appointed manager of the branch of the Goodyear Tire & Rubber Co. at Columbus, Ohio, succeeding W. W. Magill.

W. S. Boone, formerly branch manager at the Scranton, Pennsylvania, branch, has been made supervisor of city sales at Philadelphia, Pennsylvania.

W. G. Starnes has been elected manager of the Atlanta, Georgia, branch, succeeding J. E. Taylor, who has been transferred to the Dealers' Help division of the automobile tire department at Akron, Ohio.

F. W. Nason, formerly Goodyear manager at Rochester, New York, has been transferred to the export department at Akron, Ohio.

F. N. Hammond, recently branch manager at Youngstown, Ohio, has been made branch manager at Cleveland, Ohio, succeeding R. S. Hartzell, who has been placed in charge of manufacturers' business in Cleveland and vicinity, under the jurisdiction of the Detroit, Michigan, district office. Mr. Hartzell's headquarters will continue at Cleveland.

TRADE NOTES.

Some time ago the receivers of the Dreadnaught Tire & Rubber Co., Baltimore, Maryland, brought suit against certain stockholders who had subscribed for stock and then failed to pay, these unpaid subscriptions being listed among the assets of the bankrupt company. The United States Court in Baltimore has now given judgment against the subscribers, and sums varying from \$42 to \$207 will have to be paid by 16 men, the only ones out of a total of 108 who failed to settle with the receivers after being sued, without waiting for the case to be tried.

In addition to the companies mentioned last month, the McGraw Tire & Rubber Co., East Palestine, Ohio, and the Kelly-Springfield Tire Co., Akron, Ohio, have filed complaints with the Interstate Commerce Commission on freight classifications for rubber tires on the Southern railroad lines.

The New Tread Tire Co., Louisville, Kentucky, has changed its name to International Rubber Sales Co. This company acts as distributor for the International Rubber Half-Sole tires in the State of Kentucky, southern Indiana and southern Illinois, and is establishing agencies throughout this territory.

A grand prize diploma has recently been awarded the Hendrie Rubber Co., of Torrance, California, by the international exposition judges at San Diego, California. This is the more remarkable in that the company started making tires only four years ago.

The Kelly-Springfield Tire Co., New York City, has been awarded damages to the amount of \$376,000 for infringement of the Grant patent on solid rubber tires, the internal wire carriage tire used on the lighter horse-drawn vehicles. The defendants were The B. F. Goodrich Co. and the Republic Rubber Co.

The Globe Tire Co., capitalized at \$1,000,000, will locate at Laporte, Indiana, occupying the old H. B. Glover plant. The company will make pneumatic tires.

The Dayton Rubber Manufacturing Co., Dayton, Ohio, has acquired several acres of land in the vicinity of the factory for the purpose of expanding its plant. It is reported that the company recently closed an order for \$1,000,000 worth of tires. The present officers are J. A. MacMillan, president; J. C. Hooven, vice-president, and C. E. Hooven, secretary and treasurer.

The General Tire & Rubber Co., Akron, Ohio, recently opened a branch at 1120 Michigan avenue, Chicago, Illinois. This is in charge of C. B. Adair. "General" tires are in active request and the company's daily output will shortly be increased to 800 tires. This company is also one of the most important producers of automobile accessories.

The Kelly-Field Co., New York City, formerly sales agent for the Lee Tire & Rubber Co., Conshohocken, Pennsylvania, has been purchased by the latter company from its owner, Harry Field. Mr. Field, whose exceptional ability is well known, will be retained in even closer connection with the Lee company, being placed in general charge of sales as head of the department that is to be organized to take the place of the Kelly-Field organization.

The Scanlon Auto Supply Co., Rochester, New York, now acts as exclusive distributor of the Amazon anti-blowout tire for the Amazon Tire & Rubber Co., Akron, Ohio, in the territory of Rochester and five surrounding counties.

Willard C. Campbell, Isaac C. Ames and Francis C. McCarty have been licensed as commissioners to open books of subscription to the capital stock of The Ames Tire Co. of Illinois, a proposed corporation whose organization has not been completed. This company will have a capitalization of \$10,000, consisting of 100 shares of the par value of \$100 each.

At the recent annual meeting of the Ten Broeck Tyre Co., Louisville, Kentucky, directors were elected as follows: H. L. Lewman, Fred Haupt, W. C. Lewman and F. E. Trumper. The board of directors elected the following officers: H. L. Lewman,

president; Fred Haupt, vice-president; W. N. Cox, treasurer, and W. C. Lewman, secretary and general manager. The report showed that the company had doubled its business in 1916, and considerable improvements and extensions were authorized.

The Zee-Zee Rubber Co., Yardville, New Jersey, has increased its capital stock from \$400,000 to \$1,000,000 to care for the increased demand for Zee-Zee tires and tubes. The latest addition to the mill of this company is practically completed and new machinery will shortly be installed, greatly adding to production capacity.

CLEVELAND ENGINEERS PLAN MANY RUBBER MILLS.

W. C. Owen & Co., engineers, 1900 Euclid avenue, Cleveland, Ohio, announce building operations for the following rubber companies:

Plans and specifications have been completed for a new rubber factory for the A. L. A. Tire Co., Detroit, Michigan, which will have a capacity of 400 tires per day. J. J. O'Shea, president, is now receiving bids for the construction of the building, which will be of reinforced concrete, fireproof, and completely equipped.

Plans are being prepared for The Boone Tire & Rubber Co., Sycamore, Illinois, to remodel the old plant of the Sycamore Tire Co. An addition will also be made to the present building, allowing for an immediate capacity of 300 tires per day and a future capacity of 600 tires per day. Bids are now being received on the equipment.

Complete equipment will be installed for a 500-tire plant for the International India Rubber Co., South Bend, Indiana, of which George W. Odell is general manager.

The new 300-tire plant of the Pearce Tire & Rubber Co., Ashtabula, Ohio, is practically finished, and the Owen company, which designed this building completely, is in the market for equipment.

The general contract for the first unit of the new plant of The East Palestine Rubber Co. has been awarded to Walker & Curley, Pittsburgh, Pennsylvania. The building will be 60 by 450 feet, of brick and steel construction, and the entire plant, when completed, will have a capacity of 300 tires per day. The officers of this company are: Everett Lyon, president; Abram Hartley, secretary, and B. C. Tunison, treasurer.

WHAT SIX TIRE SIZES HAVE DONE.

Although about 50 stock size tires are now manufactured, an interesting canvass recently made by the J. & D. Tire & Rubber Co., Charlotte, North Carolina, shows that only six sizes supplied 94 per cent of all cars built during the year 1916. These were 30 by 3, 30 by 3½, 32 by 3½, 33 by 4, 34 by 4 and 36 by 4½. This indicates that the S. A. E. leadership toward a standardized list of nine regular sizes, and an equal number of oversizes, was a move in the right direction. It also indicates that automobile manufacturers have caught the spirit of standardization to such a degree as for the moment to have wrested the leadership from their engineers, in this particular matter at least. The following table, showing the percentage of use of the 15 sizes most commonly employed during the past year, is of genuine interest:

Size.	Per Cent.
3 by 28	1.80
3 by 30	24.12
3½ by 30	29.15
3½ by 32	7.90
4 by 32	.25
4 by 33	10.10
4 by 34	20.01
4 by 36	.15
4½ by 34	1.55
4½ by 35	.44
4½ by 36	3.34
4½ by 37	.037
5 by 36	.075
5 by 37	.959
5 by 38	.007
	99.951

THE TIRE PRICE ADVANCE.

AS anticipated in the previous issue of THE INDIA RUBBER WORLD, the prevailing prices of tires and tubes with few exceptions were advanced from 2 to 20 per cent on January 1. As already explained in these columns, this was the inevitable result of the ever-increasing cost of labor, of compounding ingredients, and latterly of crude rubber itself. The table below gives the approximate percentages of the price advance of six leading firms for the several types of tires:

Ford Sizes.		Pneumatic.		Motor Cycle.		Bicycle Tires.		Solid or Truck.	
Cas-ings	Tubes	Cas-ings	Tubes	Cas-ings	Tubes	Cas-ings	Tubes		
10	5	15	10	15	10	0	0	10-12½	Firestone
15	0	15	0	15	10	0	0	10-12½	Fisk
5-20	10	5-20	10	10	10	0	0	10-12½	Goodrich
15	10	15	10	15	10	15	10	10	Goodyear
7½	0	12-12½	0	15	10	0	0	10	Kelly-S.
11-15	2-10	11-15	2-10	15	10	0	0	10	U. S.

THE PEARCE TIRE & RUBBER CO.

Favorable progress is being made at the plant of this firm in Ashtabula, Ohio, and it is expected that the factory will be finished and machinery installed by April 1. The location is at the foot of Benefit street, where the company has purchased 4¾ acres, about 1,000 feet of which adjoins the New York Central Railroad tracks. The two-story building will be of fire-proof, reinforced concrete construction, faced with brick, and will have 24,000 square feet of floor space. Individual Westinghouse motors will be used to generate power, and automobile tires and tubes in all sizes will be manufactured.

PLANT OF PEARCE TIRE & RUBBER CO.

At a recent meeting of the board of directors A. E. Pearce was elected president, J. L. Smith having resigned, and H. J. Atwood was made secretary-treasurer, in place of P. C. Remick, resigned. The present directors are A. E. Pearce, H. J. Atwood, F. L. Kerr and J. L. Smith, one vacancy being left on the board to be filled at a special stockholders' meeting on March 1 by an experienced Akron, Ohio, rubber man whose name will be announced at that time.

ASHTON W. CANEY ORGANIZES NEW RUBBER COMPANY.

The Titan Tire & Rubber Co., Inc., Batavia, New York, notice of whose incorporation appears elsewhere in this issue, was formed through the efforts of Ashton W. Caney, whose prominent connections with the Batavia Rubber Co. and the Sweet Tire & Rubber Co., of Batavia, have been previously recorded in THE INDIA RUBBER WORLD. The Titan company will make tires and rubber goods and do a general mercantile and contracting business. The present organization is temporary in character, and mention of the definitely formulated plans of this new concern will appear later.

Of value for daily reference in every rubber office.—'The Polyglot Rubber Trade Directory, 1916.'

THE MILEAGE OF THE 1917 TIRE PRODUCTION.

Arithmeticians, whose chief delight is to play with figures, may find a few minutes' enjoyment in checking up those that follow, which emphasize anew the tremendous proportions attained by the principal department of the rubber industry in the United States. Assuming that the American tire production for 1917 will be 20,000,000 as predicted in THE INDIA RUBBER WORLD of December 1, 1916, and considering 5,000 as the average mileage for each tire, the staggering total mileage necessary to wear out the year's output would be 100,000,000,000. A car would have to cover 25,000,000,000 miles in order to wear them out, a distance equivalent to 1,000,000 times the distance around the world, or over 269 times the distance from the earth to the sun. In other words, they would replace the tire wear of an automobile going at the rate of 50 miles an hour day and night for a period of 57,077 years.

MAKING TIRES ON BROADWAY.

In order to show the public exactly what is meant by the term "cord tire," The B. F. Goodrich Co., during the New York automobile show, brought on and set up in the display windows of its building at 1780 Broadway two complete machines used in the Akron, Ohio, factory for the construction of Silvertown Cord tires. Perhaps the nearest thing to human dexterity known to mechanics, they accomplish what no human hand could in maintaining an absolutely equal tension on the cord as it passes back and forth across the surface of the form, making the tire of uniform strength at all points. Workmen, clad in white, operated the machines slowly enough so that the spectator could see how each layer of rubber-impregnated cord is applied and follow the motions of the human-like system of arms and hands which complete their several functions with such mechanical regularity and precision. As a convincing advertisement this instructive window display was a complete success.

PREVENTING TIRE THEFTS.

Year by year the "fully equipped" automobile includes more devices for the comfort, safety and assurance of motorists. Automobiling has become so general that tires are almost as good as ready money; tire thefts have therefore increased greatly and have given accessory manufacturers another subject for the application of their utmost ingenuity. But this year marks the entrance of some form of protection against tire theft as a frequent part of the regular motor car equipment. Perhaps the cleverest of the several schemes seen at the New York automobile show is that by which an extra wire wheel with tire attached is securely locked to the rear deck by means of a stud through the wheel flange. No straps or chains are required in connection with this locking device.

GOODYEAR TO MAKE OWN FABRIC.

The Goodyear Tire & Rubber Co., Akron, Ohio, which has taken a large proportion of the output of the Killingly Manufacturing Co., of Killingly, Connecticut, has now secured control of that manufacturing plant. A new company has been incorporated with \$5,000,000 under the name of the Goodyear Cotton Mills, the incorporators being Francis Seiberling, Fred Miller and Harold Hutchins. The plant is a large one with steam and water power, and its present equipment of 17,500 ring and 1,200 twisting spindles, and 60 broad looms will be further increased. It is reported that the new company has decided to erect a large yarn mill and 100 tenement houses in Williamsville, Connecticut, in the immediate future, this mill to have a capacity of 100,000 pounds of tire yarn per week.

THE UNITED STATES RUBBER COMPANY'S RE-FINANCING PLAN.

THE refinancing of the United States Rubber Co. by the issue of \$60,000,000 bonds, which, it is expected, will be authorized by the stockholders at a meeting on the fourteenth of this month, is a move of more than ordinary interest in both rubber and financial circles.

These 5 per cent bonds maturing January 1, 1917 are to be secured upon the properties owned or controlled by the company by direct mortgage thereupon or by pledge of mortgage bonds of the companies owning or controlling the same, or by pledge under the mortgage of the United States Rubber Co., or under the mortgages securing the mortgage bonds so pledged, of shares of stock of the companies owning or controlling the same with a covenant not to permit mortgages thereupon. It is understood that the purpose is to provide for the payment of all maturing obligations of this great corporation with certain minor exceptions. It is intended that all existing bonds and liens upon the properties of the company or its subsidiaries will be paid on or before December 1, 1918, the exceptions being \$2,600,000 gold bonds of the Canadian Consolidated Rubber Co. maturing in 1946 and \$9,000,000 debentures of the General Rubber Co. due December 1, 1918. The latter will be left undisturbed for the present, as the company announces it has under consideration other plans for dealing with its important crude rubber interests. Of the \$60,000,000 bonds to be issued forthwith, \$24,697,148.07 is to be set aside to retire the following:

United States Rubber 6 per cent bonds due December 1, 1918.....	\$16,000,000.00
Eureka Fire Hose Manufacturing Co. 5 per cent bonds due December 1, 1918.....	970,000.00
Canadian Consolidated Rubber Co., Limited, 5 per cent debentures due December 1, 1918.....	2,500,000.00
Morgan & Wright 5 per cent debentures due December 1, 1918.....	5,000,000.00
Mechanical Rubber Co. 6 per cent first mortgage bonds due January 1, 1918.....	\$687,000.00
Less sinking fund deposited with trustee	459,851.93
	227,148.07
	<hr/> \$24,697,148.07

The remaining bonds presently to be issued are to provide for the funding of current indebtedness, for additional working capital, for discounts and premiums in connection with the above refunding and for other corporate purposes. Another \$10,000,000 of the bonds may be issued for working capital, and for development, and for other purposes, and out of the remaining bonds reservation is to be made to provide for the \$9,000,000 General Rubber Co. 5 per cent debentures due December 1, 1918, until otherwise provided for, and the \$2,600,000 Canadian Consolidated Co. bonds, due October 1, 1946. Any additional bonds, and any bonds not used for such refunding are to be reserved for capital expenditures made after January 1, 1917, for additions, betterment, improvements, or for new properties, at 75 per cent of cost.

The circular sent out by President Samuel P. Colt states that the net earnings of the company and its subsidiary companies available for interest during these years, as found by Messrs. Haskins & Sells, have been:

For the fiscal year ending December 31, 1914.....	\$10,690,988.48
For the fiscal year ending December 31, 1915.....	11,539,313.10
For the fiscal year ending December 31, 1916 (partly estimated)	12,500,000.00

The above net earnings are after deducting expenses of every nature, except interest, and including expenditures for repairs and renewals through which the plants are maintained in the

highest state of efficiency. The average losses from bad debts during these years have been less than 1/2 of 1 per cent of the total sales.

Further, the circular states that the consolidated financial position of the company, and its subsidiary companies, as of October 31, 1916, but after applying the proceeds of the sale of these \$60,000,000 new bonds, is appraised as follows:

Property, plant and equipment.....	\$54,850,204.33
Manufactured goods and material.....	48,791,238.61
Securities owned	1,731,870.29
Net current assets, consisting of cash and receivables, less payables.....	30,840,293.38
	<hr/> \$136,213,606.61

Undisturbed bonds:

Canadian Consolidated Rubber Co., Limited	\$2,600,000
General Rubber Co.....	9,000,000
	<hr/> 11,600,000.00
	<hr/> \$124,613,606.61

The underwriting was arranged by Kuhn, Loeb & Co., and it is understood that the American International Corporation is also interested in the transaction, which seems to presage the further acquisition of plantation acreage in the Far East to insure an adequate supply of crude rubber. Subscriptions were solicited on January 17 at 96 3/4 per cent, and were largely oversubscribed when the books closed on January 23 to such extent that only about 60 per cent of amounts subscribed for could be allotted.

In this connection it is reported as probable that W. S. Kies, vice-president of the American International Corporation; C. B. Seger, vice-president of the Union Pacific Railroad, and J. S. Alexander, president of the National Bank of Commerce of New York City, will be elected directors of the United States Rubber Co. at an early meeting.

RUBBER FOOTWEAR PRICES.

AS was anticipated in the January number of THE INDIA RUBBER WORLD, the rubber footwear manufacturers sent out new price-lists the first of the year showing a material increase in the net cost of these goods to wholesalers and retailers. The United States Rubber Co. made a few changes in its gross price-lists, and these were confined to the red and white goods manufactured by that company by pressure process. The discounts of former years have been reduced to this extent: Last year first-quality goods were bought at 25 and 5 per cent off, with a further 5 per cent for early orders. On second quality the terms were 25, 5 and 10 per cent, besides the usual 5 per cent for early orders.

This year's discounts are 15 per cent off on first quality, and 15 and 8 per cent on second quality. On the differential brands, namely, Woonsocket, Meyer, Rhode Island and Jersey there is an additional 5 per cent. The discount for early orders is now allowed until the first of June for jobbers, who can, if they wish, allow this same 5 per cent discount until the first of May to their customers.

It will be seen that this makes a very considerable increase in the net cost of goods both to the wholesalers and retailers. Such portions of the orders given in 1916 which were not filled on December 31 were to be considered cancelled unless re-ordered by the customers. It is stated that although the company's sales were 15 per cent larger than the previous year, a large proportion of the orders remained unfilled because of lack of capacity of the factories, and it is expected that the coming year's business will surpass that of last year by a large amount.

COPY OF INDEX TO "Rubber Machinery" will be sent free upon request.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

ON December 28, George E. Hall, general manager and vice-president of the Boston Woven Hose & Rubber Co., of Cambridge, Massachusetts, entertained the heads of the 45 departments of the factory and business offices, at a dinner given at the City Club in Boston. The utmost good fellowship prevailed and a number of humorous "stunts," followed by a motion picture show, provided entertainment. Five reels showed the rubber industry from gathering the latex in a Brazilian forest, through the various manufacturing processes in the factory of the company, to completion in the form of the various products which the firm manufactures. This was supplemented by several reels along other lines, presenting pictures of comedy and human interest.

The Boston Woven Hose & Rubber Co. recently announced that, beginning January 15, all employes who had completed two years of continuous service with the company would be presented with an insurance policy amounting to at least \$500 and providing for an increase in value for each additional year of service from the above date. The company, as a reward for long service, also distributed gold pieces to employes of ten or more years' standing. The coins ranged from \$5 to \$20.

Honors seem to come thick and fast to Thomas A. Forsyth, president of the Boston Belting Co. Last month it was chronicled in this column that he had been made an honorary member of the Sigma Delta Sigma Fraternity—the first person outside the dental profession to be admitted to that society in the last 50 years. That the dentists of this country appreciate Mr. Forsyth's broad philanthropy, in giving to this city the great dental infirmary, was further evidenced last month when over 500 dentists from all over the country tendered him a dinner, while members of the profession, not only in this country, but even as far away as

Japan, observed "Forsyth Day" in his honor. There were present the Governor of Massachusetts, the Mayor of Boston, the presidents of Harvard University and Tufts College, the president and the president-elect of the National Dental Association, the president of the Massachusetts Dental Association, Dr. Harvey W. Wiley, and many other distinguished men. Mayor Curley in his address announced that a street near the Boston Belting Co.'s factory had been renamed Forsyth street, and Dean Friesell, of the dental department

THE FORSYTH CUP.

of the University of Pittsburgh, reported that its trustees had voted to confer on Mr. Forsyth the degree of Doctor of Laws. But the feature of the evening was the presentation of a beautiful silver loving cup subscribed for by dentists all over the world. This massive cup, shown by an accompanying illustration, is of graceful design, depicting in high relief 18 figures of children in graceful postures, while around the rim runs an appropriate inscription. Mr. Forsyth accepted the cup with a brief and graceful expression of appreciation and the happiness which this gift, as

well as the work of the infirmary, would always give him. The affair was a fitting tribute to the man who has spent millions of dollars to alleviate suffering by the children of this city.

A fire starting in the churn room of Stowe & Woodward Co., Newton Upper Falls, Massachusetts, rubber manufacturers and proofers, practically demolished the entire spreading plant, with an approximate loss of \$20,000. Fortunately, the power plant, storehouse and hard rubber department were not damaged, and the company is now making plans to put up a cement building somewhat larger than the former wooden building and expects to be running again in two or three months. Meanwhile, orders in the spreading line are being cared for at the Campello, Massachusetts, factory of the company.

Another fire, which might have been much worse, was that at the Converse Rubber Shoe Co.'s plant in Malden on January 21, where a frame structure, used as a temporary storehouse, gave the firemen three hours of lively work, keeping the flames away from another building in which solvents were stored. The loss to the company was comparatively small.

Superintendents and foremen cannot impress too strongly upon workmen the danger attending the handling of gasoline, naphtha and similar solvents. Only last month two men in the employ of Bartels & Thelan Shoe Co., Chelsea, were sent to the storehouse to get some rubber cement. The storehouse was dark, and one of them held a match over the bung-hole of a cement barrel. The result was an explosion; both men were severely injured and several hundred employes rushed from the factory in disorder, returning, however, upon learning that there was no further danger. The fire department was called out, but the monetary loss was small.

An accident occurred last month in a dry-cleansing plant in Lewiston, Maine, where nails in a workmen's heel struck a spark which ignited gasoline vapor, and in an instant the whole establishment was ablaze and a loss of \$4,000 resulted. This is a phase of the danger from rubber solvents which it may be well to recall. Many factories nowadays have concrete floors, and friction from heel-nails is quite likely to create a spark, with disastrous results. The moral is for rubber employes to wear rubber heels.

The main shaft at the Boston Rubber Shoe Co.'s plant in Malden was fractured a few weeks ago, requiring a shutdown of two days in several of the departments. This shaft was 17 inches in diameter and was driven by a 1,200-horsepower engine. A number of emergency motors were brought into use, thus enabling some of the machinery to be run. The break happened at an unfortunate time when the factory was running to full capacity on orders, in many departments double shifts of workers being employed.

The Hood Rubber Co., East Watertown, has completed plans for the erection of a foundry and pattern shop on land contiguous to the factory. The new building will measure 80 by 160 feet, two stories high.

The prevailing high footwear prices and the growing demand for rubber-soled shoes, also the increasing call for rubberized fabrics, rubber and fiber compositions in the manufacture of footwear, were concisely explained by W. E. Barker, manager of sales of the United States Rubber Co., at a recent luncheon of the National Shoe Wholesalers' Association in Boston, when he stated that American stocks of manufactured footwear today

total \$15,000,000 less than a year ago, and \$8,000,000 less than two years ago. In this connection W. H. Palmer, of the United States Rubber Co., at the annual convention of the National Shoe Retailers' Association in Cincinnati, Ohio, not long ago, reviewed the remarkable growth of the rubber sole business and also stated that the shipments by his firm of canvas upper, rubber-soled footwear for the year ending August 31, 1907, amounted to 149,374 cases, but that since then the business has increased more than fourfold.

* * *

The J. W. Wood Elastic Web Co., of Stoughton, Massachusetts, is erecting the second large addition to its plant during the past year. The new building will be 60 by 125 feet, of especially heavy construction, two stories high, with walls of reinforced concrete, and when completed, the work which has been done at Brockton in the past will be taken care of in the new building.

* * *

Dr. Warren K. Lewis, professor of chemical engineering at the Massachusetts Institute of Technology, Cambridge, has been appointed consulting chemist for the Goodyear Tire & Rubber Co., Akron, Ohio. He will still hold his professorship at this great technical institution, taking trips to Akron as occasion may demand.

* * *

Francis H. Appleton, the well-known manufacturer of reclaimed rubber, was reelected Chief Rabban of Aleppo Temple, Mystic Shrine, in this city, last month. Captain Appleton stands very high in Masonic circles. He was also one of the committee to visit England a few years ago, to tender to King George the certificate of honorary membership in the Ancient and Honorable Artillery of this city.

* * *

Lester Leland, vice-president of the United States Rubber Co., was reelected a director of the American Trust Co. at its annual meeting. Mr. Leland resigned his position as director of the Second National Bank, the vacancy being filled by Matthew C. Brush, president of the Boston Elevated Railway.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

EMPLOYEES of the Firestone Tire & Rubber Co. are responding enthusiastically to the newly inaugurated stock distribution plan whereby it is possible to become a stockholder in the company. The plan provides for the distribution of one to ten shares of stock to each employee, according to term of service. It can be purchased at \$100 per share, although the present market value is about \$140. Easy payments can be made for five years, during which period the stock must remain on deposit with the company.

At the annual dinner to the 500 superintendents, foremen, department heads and their wives held recently in the Firestone clubhouse, President H. S. Firestone outlined the company's offer and its object. "We want to hold the interest of our employees," he said. "The only way to do that properly is to give them a real interest in the company. It is better for the company and better for the men. If you have a real interest in the work you do, there is nothing in the world that gives you more pleasure than your work, and at the same time you become much more efficient."

R. E. Lee, R. E. Glass, L. B. Walters and R. C. Lepper also spoke at the dinner, and J. W. Thomas, general superintendent, acted as toastmaster. Motion pictures and music furnished pleasing entertainment.

President Firestone recently purchased a beautiful winter home in southern Florida, where he and his family are to spend the latter part of the winter.

The books of The B. F. Goodrich Co. have been closed for the purpose of compiling the full annual report for the year 1916. The results are as follows, subject only to the verification of public accountants and auditors:

After making full provision for all maintenance charges, depreciation, bad and doubtful debts, and other items which it was deemed wise to take out of the year's earnings, the net profits for the period amount to approximately \$9,550,000.

This amount, added to the surplus carried over as at December 31, 1915, of \$10,580,000, shows undivided profits of approximately \$14,900,000 after deducting the four quarterly dividends of $1\frac{3}{4}$ per cent on the preferred and 4 per cent on the common stock outstanding, together with the following provisions: \$700,000 for the redemption of preferred stock; \$121,460 representing the reduction of preferred stock purchased from cost to par, and \$100,000 appropriated for pension fund.

At the regular quarterly meeting of the directors held on January 24 a dividend of $3\frac{1}{2}$ per cent was declared on the preferred stock, payable $1\frac{3}{4}$ per cent April 2, and $1\frac{3}{4}$ per cent July 2.

A quarterly dividend of 1 per cent was declared on the common stock, payable May 15, 1917.

The directors voted, subject to the approval of the stockholders at their annual meeting March 14, to retire 9,000 shares of preferred stock prior to July 1, 1917. This makes a total retirement of 36,000 shares covering the charter provision for retirement of preferred stock up to July 1, 1917.

The net earnings for 1916 were less than those of 1915, which is largely due to the fact that advances in selling prices have not kept pace with rapidly increasing costs. However, the directors consider the results satisfactory under the conditions which prevailed.

During the past month 50 representatives of the waterproof clothing department of The B. F. Goodrich Co. met at the home office for a week's convention. Formerly, mere utility governed the waterproof garment situation but, nowadays, cut and style and originality play as large a part in this type of clothing as in any other. J. W. Jones, sales manager of this division of the Goodrich company, stated that the finest artists and models obtainable are employed in creating new models from year to year in keeping with other styles in men's and boys', ladies' and misses' clothing.

W. O. Rutherford, general sales manager of the Goodrich company and a director of The Motor and Accessory Manufacturers, was one of the prominent visitors at the automobile show in New York City during the past month.

Henry C. Geer, formerly general foreman of the Goodrich company, was recently placed on the retired list, after 35 years' service, following a remarkable record of only three weeks' absence, caused by illness, in all that time. He is now taking a prolonged vacation at Miami, Florida. When Mr. Geer entered the employ of the Goodrich company, its products consisted of rubber rolls for wringers, solid rubber tires for high-wheeled bicycles, and rubber hose, while to-day the company manufactures over 10,000 different rubber articles.

* * *

Men from practically every quarter of the civilized globe take part in the making of Goodyear products, and an interesting organization formed by The Goodyear Tire & Rubber Co. to aid in the true Americanizing of these varied elements is the Goodyear Cosmopolitan Club, composed of workmen representing 20 different nationalities. The charter members are men of prominence and influence among the men of their respective nationalities and with the utmost enthusiasm for American institutions and ideals, and will undoubtedly be instrumental in promoting fraternal feeling.

The previously mentioned citizenship classes maintained by the Goodyear company for alien workmen are also a valuable aid

in furthering an intelligent conception of American principles of government and other matters calculated to increase the usefulness of these men in the land of their adoption. In this connection it is interesting to note the new division of the company's school which has been inaugurated for deaf mutes, about 200 of these "silent" workers now being employed at the Goodyear plant.

Charles Seiberling, son of C. W. Seiberling, vice-president of the Goodyear company, and L. G. Odell, of the crude rubber department, recently departed for India on an extended tour.

* * *

At the recent annual meeting of the General Tire & Rubber Co. the officers were reelected and the following directors named: M. O'Neil, W. F. O'Neil, W. E. Fouse, G. F. Burkhardt, J. A. Diebolt and T. F. O'Neil. M. O'Neil is president; W. F. O'Neil, vice-president and general manager; W. E. Fouse, secretary and Charles Herberich, treasurer. A quarterly dividend of $1\frac{3}{4}$ per cent was declared on the \$200,000 issue of preferred stock. The company has also \$300,000 outstanding in common stock and is building an addition to its factory in East Akron.

* * *

The annual report of the Portage Rubber Co. recently submitted to shareholders showed a net profit of \$232,000. This is approximately 16 per cent on the present outstanding stock and shows a net increase of 81 per cent over the previous year. B. J. Wildman, former Chicago manager, was elected secretary to succeed W. J. Anderson, who is no longer with the company.

* * *

The Mohawk Rubber Co. has increased its common capital stock from \$500,000 to \$1,000,000. The company retains the \$50,000 of preferred stock which it had, thereby securing a total capitalization of \$1,050,000. The new stock has not been placed on the market, but will be partially distributed among the stockholders as a stock dividend, and the balance held in the treasury temporarily. This increase was made necessary by recent additions to the factory and increased business.

* * *

The Akron Biltwell Tire & Rubber Co., notice of whose incorporation appears elsewhere in this issue, will shortly commence the erection of a factory in the eastern part of the city. The main building will be of brick construction, 60 by 150 feet, two stories high.

* * *

John W. Herron, formerly assistant to H. H. Henderson, succeeds the latter as manager of the Akron office of Henderson & Korn, crude rubber importers, Mr. Henderson going to the New York City office of the company.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE rubber factories throughout Rhode Island continue to be rushed to their capacity with business in all lines, with no indications of any immediate cessation either in orders or operations. The makers of tennis and other shoes are especially busy. Nearly all of the plants have been closed for a few days each for the taking of an inventory, but have resumed under a higher pressure than ever, frequent newspaper warnings that retail prices on rubber goods were to be advanced having resulted in exceptional demands.

One of the greatest handicaps that the rubber manufacturers in this vicinity have had to face during the past year and a half has been the scarcity of help of even mediocre ability, while expert rubber workers have been almost priceless. Even the payment of the highest scale of wages ever paid in Rhode Island rubber plants has failed to secure the desired number of operatives.

The O'Bannon Corporation, with extensive holdings in West Barrington and East Providence, has purchased the International Rubber Co.'s plant, also at West Barrington, and will change the firm name to the International Rubber Cloth Co. Richard LeBaron Bowen, general manager, announces extensive enlargement, and the employment of fully a hundred more operatives. The International Rubber Co. has been engaged for some time in making automobile tops, rubber coverings and other goods, employing approximately 125 persons. The O'Bannon Corporation also has a large plant at Phillipsdale, known as the Nonnabo Chemical Co., where cellulose products are made, and a second at West Barrington, where artificial leather is manufactured. The concern will employ approximately 1,500 persons in its three plants.

* * *

Another phase of the various suits against alleged infringement of the so-called Osburn patents for flexible electrical conduits was brought up before Judge Arthur L. Brown in the United States District Court for Rhode Island recently, with the hearing of the case of W. C. Robertson *et als* against the Tubular Woven Fabric Co., of Pawtucket.

According to the allegations made by the plaintiffs, the Tubular Woven Fabric Co. is now making a conduit which is an infringement of the Osburn patent, as was the original product of this concern, which it stopped manufacturing when it was adjudged guilty of infringement through previous proceedings. The plaintiffs have therefore now brought a supplementary bill to determine whether the new product of the defendants is also an infringement. Two days were required in the presentation of the arguments, during which numerous samples of the conduits manufactured by the two companies were brought into court for inspection. The matter was taken under advisement by Judge Brown.

* * *

The Millbury Rubber Co., Millbury, Massachusetts, has been incorporated under the laws of Massachusetts, with a capital stock of \$90,000, in which Worcester men are largely interested. The new concern will take over the plant of the Stoddard Rubber Co., Inc., and operations will begin in a few days.

The new company is authorized to issue \$30,000 in preferred stock and \$60,000 in common stock, practically all of which will be held in Worcester. The permanent officers of the corporation under the reorganization are as follows: DeForest E. Martin, president; Albert W. Blackmer, treasurer and clerk; DeForest E. Martin, Albert W. Blackmer, Warren F. Holden, Albert F. Richardson and Francis H. Dewey, Jr., directors. Automobile tires and other rubber goods will be manufactured on an extensive scale, new equipment being installed and additional employees taken on as rapidly as business conditions warrant.

* * *

The great success that has attended the introduction of specialized sand blast machines in rubber plants for use in automatically cleaning automobile truck tire rims, cutting off any barbs that may occur, and in reducing inequalities has caused an increasing demand during the past year. H. J. Astle & Co., Providence, has installed several in the United States, also in Canada, England, South America and elsewhere. At present two large machines are being constructed, one for the Russian-American India Rubber Co.'s plant at Trengolnik, Petrograd, Russia, and the other for the Canadian Consolidated Rubber Co., Limited, Kitchener, Ontario.

* * *

The Tamarack Co. has started the erection of a large addition to its Pawtucket plant to take care of heavy orders for the manufacture of automobile tire fabric.

The new building will be 110 by 193 feet, of mill construction, three stories and basement. It will increase the floor space by

80,000 square feet, and will give employment to 1,200 more men about the first of March.

* * *

Arthur Carr has been made general superintendent of the Revere Rubber Works, Providence. Although but little more than 30 years of age, Mr. Carr has been in the employ of this concern for several years, and foreman of at least half a dozen of the departments of the plant. He is now at the head of all departments, being assistant to factory manager W. H. Waite.

* * *

The Arcade Rubber Co., which has taken over the store of the Decker Rubber Co., 76 Weybosset street, Providence, is being conducted by the Direct Rubber Co., 47 Pine street, of which Elwyn C. Thayer is treasurer.

* * *

John M. Norris, who was employed for many years with the National India Rubber Co. at Bristol, and later as foreman in the calender department of the International Rubber Co. at West Barrington, died at the State hospital at Howard, January 17, after a long illness. He was 53 years of age and a native of Bristol, where he has a wife, two sons and a daughter.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

ONE of the most important happenings for a long time in the rubber field of Trenton was the formal reorganization this week of the Empire Rubber and Tire Co., with a capital of \$1,500,000 preferred and \$3,000,000 common stock. The new president, succeeding General C. Edward Murray, is J. E. Baum, president of the Supplee-Biddle Hardware Co., Philadelphia, Pennsylvania, and a director of the Corn Exchange Bank. General Murray still retains a substantial interest in the company, although he disposed of some of his stock at the time of the reorganization. His son, C. Edward Murray, Jr., is vice-president, and his other son, J. Cornell Murray, is treasurer of the company.

Other officers of the new company, not enumerated above, are: E. B. McKay and J. A. Perkins, vice-presidents; A. Boyd Cornell, secretary. The board of directors is made up of J. E. Baum, General C. Edward Murray, J. Cornell Murray, E. B. McKay and F. A. Forbes.

Mr. McKay was for many years Chicago manager of the Empire company. A. Boyd Cornell, the secretary, has also been long identified with the concern. Some of the new capitalists are said to be heavily interested in automobile manufacturing, and this of itself, it is thought, will aid in greater development of the Empire plant. It is expected that the present capacity will be about doubled before the end of the present year.

* * *

Justice Kalisch, of the New Jersey Supreme Court, has handed down an opinion reversing the decision of Judge Marshall, of the Mercer County Court, in the case of Arthur F. Foley, traveling salesman for the Home Rubber Co., who was drowned when the steamer "Lusitania" was torpedoed in May, 1915. Mrs. Foley brought suit for \$3,000 under the workmen's compensation act. An insurance company defended the suit and the Home Rubber Co. was not a party to the action. Judge Marshall decided against the widow.

Justice Kalisch, in reversing this decision, sets forth some legal facts which will doubtless be of interest to all employers of traveling men. Justice Kalisch says that Judge Marshall's determination of fact was apparently founded upon a misconception of the legal principle applicable to it. The trial judge, he states, appears to have disposed of the facts upon the mistaken notion that in order to hold a master responsible for an injury to his employe as a result of an accident, the accident must be one of which the actual negligence is the natural and proximate cause. It is clear from a plain reading of the statutes, Justice

Kalisch holds, that the question of negligence does not enter into the consideration at all where compensation is sought under section two of the act. It was advanced for the defendants that the torpedoing was something not reasonably to have been anticipated. The rubber company, Justice Kalisch holds, knew that Foley, its agent, was booked upon the "Lusitania" and it was legally bound to take notice that because of a condition of war between Germany and Great Britain, ships might be captured or sunk. Precedents show that if the vessel had been lost through collision, fire or storm, the mishap would have been construed as one arising out of Mr. Foley's employment. The fact that the ship was lost by an extraordinary peril does not make it less an accident arising out of employment. The case will now be placed on schedule for another trial.

* * *

A case of history faking which aroused interest throughout New Jersey and in which the late Frank A. Magowan, one-time rubber king, was the central figure, has just been rectified, much to the satisfaction of his friends. Many years ago Mr. Magowan gave unsparingly of time and money, and was one of the prime movers in a plan to have the Battle of Trenton commemorated by a suitable monument. Finally, after years of effort, Congress agreed to bear part of the expense. Mr. Magowan was appointed a member of the Battle Monument Association, composed of about a dozen prominent men, in charge of the erection of the monument and its care after its completion. No appointments were to be made to fill vacancies caused by death, and following the demise of the last member, the work devolved upon the State. After Mr. Magowan met with reverses some years ago and finally drifted low on the social and financial scale, his name was secretly chiseled from the bronze tablet in the monument and the name of another man substituted. The official picture of the Monument Association was also doctored so that the face and head of another man was placed where that of Mr. Magowan had been. Now, thanks to the work of his son and the efforts of a local newspaper, the wrong has been righted and both name and picture have been restored.

* * *

The Ajax Rubber Co. has increased its capital stock from \$5,000,000 to \$10,000,000.

* * *

W. J. B. Stokes, the rubber manufacturer, has been reelected a director of the Broad Street Bank.

* * *

The newly finished State museum was opened this week in the State House. One of the exhibits is from the United & Globe Rubber Manufacturing Cos. It shows rubber in process of manufacture from a crude state to a finished automobile tire. This firm is erecting a \$1,000 addition to its plant.

* * *

A dinner was recently given by the officers of the Thermoid Rubber Co. in honor of the branch managers of the concern who were in Trenton for an annual conference. Those present were: J. Oliver Stokes, president; W. J. B. Stokes, treasurer; Robert J. Stokes, secretary; Dale O. Pohlman, sales manager; Joseph Liston, Chicago, Illinois; George W. Whittemore, Boston, Massachusetts; L. T. Kuhl and J. W. Pohlman, Indianapolis, Indiana; J. N. Kirk, Jr., New York City; Harold F. Blanchard, Philadelphia, Pennsylvania.

A RUBBER SPONGE PEN-WIPER.

A suggestion for cleaning steel pens, said to be decidedly more efficacious than the ordinary pen-wiper, is to place a rubber sponge, wet with glycerin, in a glass holder, the sponge remaining moist and always ready for use. The ink is absorbed from the pen by contact with the glycerin, a thin layer of which adheres to the pen, preserving it and making it take the ink at once when dipped.

The India Rubber Trade in Great Britain.

By a Special Correspondent.

CONGESTION is general in the rubber trade at the present time in this country, and is especially affecting the fabric proofing industry, which is flooded with goods for rubberizing. The government has obtained cloth too quickly for proofers to handle it. Heavy twills for trench capes are monopolizing the activities of the proofing industry. It is stated that one firm alone is rubberizing from four to five thousand pieces of this fabric weekly and this rate of output promises to continue far into February.

RUBBER FOOTWEAR.

Recent snow storms found retailers quite short in supplies of rubber footwear; most were sold out the first two days of the "slushy" weather, despite the partial relief afforded by American supplies.

MECHANICAL GOODS.

Mechanical rubber goods continue in good demand, and all kinds of molded articles are being sought in large quantities. The scarcity and high cost of leather has greatly increased the demand for rubber and fabric belting. Large orders were recently booked for armored hose for government purposes and great quantities of trench hose are being taken by the armies in France, so that the rubber hose people have their hands full.

ERASERS.

Austrian erasers are being replaced by an American rubber composition which well answers the purpose but wears much faster than pure rubber. These American erasers are sold to dealers on cards of one or two dozens and retail at a half penny (1 cent) each.

DRUGGISTS' SUNDRIES.

The government is purchasing large quantities of fine rubber sheet and it is freely stated that far more could be used than can be produced.

Waterbottles are selling faster than the proverbial hot cakes; so are air cushions, especially those of cheap Japanese makes.

Business in rubber toys and similar materials is very brisk. Celluloid is scarce and a tough quality of china is being substituted for it by London doll manufacturers.

A large Christmas business was done in rubber-lined ties. Their great merit lies in the fact that the rubber prevents creasing, and the application of a hot iron rapidly restores the tie to something approaching its original freshness.

PATENT VULCANIZATION ACCELERATORS.

The use of any means for saving either time or labor is of vast importance to our rubber industry at the present time. The North British Rubber Co., Limited, of Edinburgh, recently applied in the Patents Court for Board of Trade license to use four German patents by the Bayer Co., of Germany, for an accelerating process in the vulcanization of rubber in which piperidine or its homologues are active elements. The Board of Trade has not yet decided the terms on which the license will be granted.

NORTH BRITISH RUBBER CO. EXTENSIONS.

The demand for this company's tires has been such since the outbreak of the war that it has been found necessary almost to double the extensive tire making plant. The present department has been working night and day without cessation, but has proved altogether inadequate to meet the rapidly increasing demand since the outbreak of the war.

RUBBER AND POTTERY.

A direction in which there may be scope for increased use of rubber is the direct printing of pottery in one or more colors. The great obstacle to printing pottery has been that

it cannot be flattened like a flexible sheet of paper. If it is to be printed upon directly, it must be with the aid of some flexible, durable material that can be made to take the same shape as the pottery, that can be spread out flat to receive a coat of color from a roller, and that will, when pressed on the ware, leave a print; all qualities which rubber possesses to a marked degree. But, unfortunately, rubber stamping does not produce high-class work, even on paper, while on pottery it is even less satisfactory, except perhaps in the case of gold stamping, which it makes very clear, provided the design be simple.

At a recent meeting of the English Ceramic Society, however, W. Sherratt described a new development which may lead to a revolution in methods of direct printing on pottery.

Mr. Sherratt claims that rubber can now be prepared which will print equal to copper plate printing, and that the way is, therefore, cleared for a direct printing machine. He also claims that a machine has been devised for holding the improved rubber, for applying a coat of color to it, for shaping it to the object and printing on the pottery, and for drawing it away again to receive more color. The mechanism of this almost human device is said to be very complicated.

The machine will print up to 60 dozen articles in an hour (not counting any time for stoppages), and can be driven by a small electric motor of 1 horse power. Samples of ware printed by this system were exhibited.

THE SITUATION IN SCANDINAVIA.

By Our Regular Correspondent.

CONDITIONS in Scandinavia to-day are in many ways very similar to those in the United States. The demands of the warring nations for practically everything we can produce have caused prices to rise rapidly and many persons have profited thereby. The purchasing power of our people was never so great as it is now, and the rubber trade and industry are profiting by the prevailing prosperity and comparative freedom from foreign competition.

True, the restrictions of the British Government on rubber shipments are bearing heavily on both manufacturers and consumers of rubber goods, but this has not prevented the industry from experiencing unprecedented prosperity and development in all of its branches. The population of Scandinavia has been greatly increased by German refugees, money is circulating as never before, and our rubber manufacturers are getting "their prices" for all the goods they can turn out. No rubber goods are being exported, the home markets alone are more than our manufacturers can supply.

RUBBER FOOTWEAR.

As prior to the war, footwear is the chief item of our rubber manufacturers, but other branches of the industry have grown immensely and the scarcity of raw materials alone has prevented even more extraordinary development.

Automobile tires, that formerly were practically all imported, are now being produced in quantities that are immense when compared with what were being produced prior to the war.

INSULATED WIRES AND CABLES.

The high cost and scarcity of coal that has been general in Scandinavia since the outbreak of the war has caused rapid development of the wonderful water power of our mountains. Electric power plants have rapidly increased, especially in Norway. The result of this is that the demand for insulated wires

and cables is greater than ever before. In fact, the demand is so large that, despite the large capacity of domestic factories, which have more than doubled their output, almost a million dollars' worth of electric cables were imported into Norway alone during the year 1916.

RUBBER FACTORIES.

Scandinavian rubber factories are now up to date in every sense, and very large, though, of course, we make no attempt to compare them with the gigantic rubber factories of America. Our plants have grown immensely both in capacity and in efficiency during the past two years, and when peace is reestablished, foreign manufacturers, who now complain of the difficulties in the way of international trade, will hardly find their Scandinavian business better than it is under present conditions. Their tire business, however, will probably be an exception to this rule, for the automobile tires, both solids and pneumatics, that are now being produced in Scandinavia leave much to be desired and must be greatly improved if they are to compete successfully with good foreign products. In other lines, however, our manufacturers will not have to fear foreign competition, for they have learned to satisfy practically all of our requirements, even under the difficult conditions now prevailing. With ample supplies of raw materials they will probably be able even to enter the export field themselves.

HEADS TRAINED ABROAD.

Most of the managers, chemists, superintendents, and also many of the salesmen employed by Scandinavian rubber factories are men who have gained most valuable experience in schools, factories and business in America, England, Germany and France. Since the outbreak of the war, numbers of Scandinavians, who held responsible positions in various foreign countries, have returned to their native lands and are applying the most approved modern methods in our rubber and cable factories.

BRITISH RESTRICTIONS.

Besides curtailing the development of our rubber industry, the British restrictions on rubber shipments, coupled with the shortage of ocean tonnage, have seriously interfered with the automobile business which is so closely related to the rubber industry.

Only a few cars are produced in Scandinavia; practically all are imported and, since the war, there has been an increasing demand which is supplied chiefly by American companies. American cars arrive here without tires and, before a set of tires can be obtained for one of them, an old set must be turned in, which means that some other car must be put out of commission, or a number of cars deprived of their spare tubes and casings. All tires imported here must pass through London, and the strictest kind of supervision is exercised by both British and Scandinavian authorities to prevent tires or, in fact, rubber in any form, from reaching Germany.

The attitude of the people towards these vexations varies from one country to another, according to interests involved. In Sweden, where German refugees are far more numerous than in Norway or Denmark, and where the bulk of the trade is with Germans and Germany, the feeling created is hostile to the British action. It is argued that the export embargoes all Scandinavian governments have placed on all goods containing rubber should be sufficient guaranty for England, and that, consequently, the British restrictions are not justified.

In Norway and in Denmark, the opinions, as well as the interests of the people, lead them to feel that what is best for England is, in the long run, best for them. Despite all the Scandinavian export embargoes, considerable rubber has been smuggled into Germany at very big profit, and it was in order to check this that Great Britain, in accord with the several Scandinavian countries, developed the system which is now an obstacle to the sale of American cars in Scandinavia, and by which no one can buy a new tire without turning in an old one.

A contemplated visit in the near future to all the rubber factories in Scandinavia will soon result in a series of letters devoted to the various plants in Norway, Sweden and Denmark.

THE LYONS SAMPLE FAIR.

The Sample Fair, which occurs annually in Lyons, France, will be held from March 1 to March 15. Last year this fair, which is the successor of the heretofore great Leipzig Fair (now closed to the world because of the war), had 1,342 different exhibitors, representing manufacturers of the following countries: France, Italy, Great Britain, Canada, Russia, Spain, Portugal and the Orient, and a very large attendance of wholesale buyers from all over the world.

At that fair not an American manufacturer made an exhibit. Business to the amount of \$10,000,000 was transacted, and over \$8,000,000 more was offered, but refused because of the inability of manufacturers to make deliveries. An American committee, headed by George B. Van Cleve, of New York, organized by Mr. Piexotto, president of the American Chamber of Commerce in Paris, and comprising presidents of the chambers of commerce of the principal cities in this country, is endeavoring to have American manufactures well represented at the coming fair, which will be visited by wholesale buyers from Europe, the Orient and South America. It is estimated that their orders will aggregate \$40,000,000 to \$50,000,000.

CORK RIVALS RUBBER FOR WATERPROOFING IN FRANCE.

The French government recently placed orders for hospital sheetings and similar articles manufactured by a new method of proofing materials with cork, which is said also to give satisfaction for featherweight garments. It is waterproof, a non-conductor of heat and unbreakable. A special machine produces very thin veneer of an even thickness from black cork. The veneer is placed in chemical baths in order to remove the resinous parts, which render cork a more or less brittle substance. After this treatment the cork veneer becomes quite flexible, and compares favorably in this respect with thin leather. In fact the sheets can be folded and bent without breaking.

By combining the cork sheets with any suitable cloth, preferably a thin and strong cloth of good color, an excellent waterproof material is obtained. An adhesive preparation is used to cement the cork to the cloth; or, if a stronger garment is desired, the cork sheets are placed between two layers of cloth.

Fabric prepared in this manner is said to have a decided advantage over ordinary waterproof materials, because it is porous, permitting ventilation where the ordinary waterproofing prevents it. Of course the cork is very light, and an aviator's coat made of this combination is said to be the lightest on the market.

THE RUBBER TRADE IN JAPAN.

By a Special Correspondent.

IMPORTS OF CRUDE RUBBER.

THE Japanese importation of crude rubber during the last year was estimated to be 3,903,552 pounds [\$1,715,796.50], and showed 1,595,771 pounds [\$642,479.50] increase over that of the previous year.

This increase is the result of the great demand for rubber goods, and the new factories organized to meet this demand, among them Futaba, Minatogawa and Ishiyakawa have their plants near Osaka. In Tokio eight new factories were established, and other old companies enlarged their capacities to help fill the shortage caused by the war.

As the number of manufacturers increases, the price of the manufactured goods goes down. For instance, a few years ago a pair of bicycle tires cost from \$2.50 to \$3, but now the price is only about 90 cents a pair.

Factories in Tokio or Osaka received orders for 60,000 pairs of

tires for exportation. Before the war tires for rickshaws for use in China and other eastern colonies, were imported from Germany, but for the last two years Japanese tires have taken the place of those of German make.

Certain companies in Japan had special orders from England for automobile tires, and it is estimated that they made ten times as many as they had expected. The manufacturers at present want more orders for exportation than for the home market, for the domestic price has been low for some time. Previously crude rubber was imported from Singapore, but after the prevention of exportation, most of the raw material came from Ceylon. This Ceylon rubber is said to be superior in quality to that of Singapore, but as the price is a great deal higher, and as it takes a longer time for transportation, the manufacturers prefer to import their material from Singapore, and in some way, despite the law, they have succeeded in obtaining material from there since last April.

Until the beginning of the war no rubber was imported from Hawaii, but when the exportation from Singapore was stopped, the manufacturers obtained some raw material from there. Now that rubber is again being imported from Singapore, the manufacturers get very little from Hawaii, although the rubber goods business depends largely on this small supply, and would be seriously injured if it were stopped, even temporarily.

The finer quality of rubber required for certain goods is imported from England. A few of the manufacturers get this finer material from the United States, but as it is a good deal more expensive than the English material, the majority of them prefer the English market.

THE EXPORTATION OF TIRES.

The exportation of tires for last year amounted to 2,486,569½ pounds [\$1,706,314.50], showing an increase of 1,630,177½ pounds [\$1,663,179.50] over that of the preceding year. Until the war began, European and American tires were used principally, but since then the Japanese manufacturers have had to supply them. At present orders from Russia are pouring in, and the export for Russia this year is far in advance of other years. The exportation of rickshaw tires makes up one-half of the whole amount. These are made mostly by the Dunlop, the Oriental Rubber, the Mitatsuchi and the Nippon rubber companies.

Automobile tires are manufactured mainly by the Kakinchi and the Dunlop companies. The sizes of these tires differ according to the countries from which the orders come. Sometimes the manufacturers have to use meters instead of inches, and on this account the work is rather complicated. The average sizes, though, vary between 28 by 3 and 35 by 5. Manufacturers are also receiving large orders for solid tires, and the demand for these, as well as for the others, is rapidly increasing.

ECONOMIC ADVANTAGES.

From an economic standpoint the Japanese unquestionably hold certain advantages in the rubber industry of the world. They are a frugal people, practicing every possible economy, so that wages and the cost of living are remarkably low. Women occupy about 75 per cent of the positions in labor, both in factories and agriculture. As employed at hand-made tires they receive from 12½ cents to 24 cents per day of 12 hours. The highest wage paid to male superintendents and foremen is 64 cents, whereas the average workman receives only 25 cents per day. This in large measure explains the suprisingly low prices at which rubber goods of Japanese manufacture are obtainable here.

PICTURESQUE JAPANESE ADVERTISING.

That Japanese manufacturers appreciate fully the power of attraction of illustrations in their advertising is indicated by the accompanying reproduction from a page in "The Gomu-Sekai," the Japanese rubber trade paper. This striking design heads the

advertisement of druggists' sundries of Skinjiro Muneta, 20, Nichome, Doshomachi, Higachiku, Osaka.

SIAM'S IMPORTS OF RUBBER GOODS.

ACCORDING to American consular advices, Siam's imports of rubber goods for the last three fiscal years ended March 31, 1916, have shown the following variation: 159,115 pounds, valued at \$119,507, for 1914; 143,506 pounds, valued at \$103,702 for 1915; and 157,931 pounds, valued at \$127,507, for 1916. The imports for 1916 included 58,565 pounds of automobile tires, valued at \$51,978; 13,380 pounds of cycle tires, valued at \$14,551; 41,323 pounds of other kinds of tires, valued at \$16,795; and 44,630 pounds of all other rubber manufactures valued at \$44,183.

SOURCES OF IMPORTS.

The sources of rubber goods imports for the fiscal year ended March 31, 1916, were: From the United Kingdom, automobile tires, \$39,902; cycle tires, \$4,941; other kinds of tires, \$12,771; and all other rubber manufactures, \$11,155. From United States, motor car tires, \$872; cycle tires, \$3; all other kinds of tires, \$134; and all other manufactures of rubber, \$1,002. From Italy, cycle tires, \$395. From Japan, tires, \$17; and all other rubber manufactures, \$2,584. From Singapore, automobile tires, \$39,902; cycle tires, \$9,011; all other kinds of tires, \$3,873; and all other rubber manufactures, \$27,791. From all other countries, \$1,651 worth of rubber manufactures other than tires.

Taking the totals of all rubber goods imported during the fiscal year ended March 31, 1916, it will be noted that \$80,591 worth is credited to Singapore, a British port of transshipment; \$40,226 to the United Kingdom; \$2,011 to the United States; and \$4,448 worth to all other countries.

TIRE MARKET.

The roads in and around Bangkok, the capital of Siam, are favorable to the use of rubber-tired vehicles, and the use of the automobile and bicycle is steadily increasing. The total number of motor cars on the register up to April 1, 1916, was 875. Rubber tires are used for horse-drawn vehicles, as well as for the rickshaws drawn by the Chinese coolies.

During past years American manufacturers apparently have not displayed any active interest in Siam's needs for rubber goods, but in 1916 an American concern established an agency for its automobile and other tires, and American salesmen are said to have taken fair orders for other kinds of rubber goods.

The import duty on all kinds of rubber goods is 3 per cent ad valorem.

BELGIAN CONGO RUBBER EXPORTS.

The latest available statistics of the foreign trade of the Belgian Congo are for the year 1915 and show that exports of crude rubber amounted to 4,428,945 pounds, against 4,892,166 pounds exported the previous year.

Rubber Planting Notes.

RUBBER TAXATION IN THE FEDERATED MALAY STATES.

ACCORDING to recent advices from the Far East, there is in Malaya considerable agitation with the object of adding still further to the export duty on crude rubber.

At the present time the export duty is 2½ per cent ad valorem. It is suggested that at the next Federal Council of the Federated Malay States a motion may be introduced to provide for an additional export duty of one Straits Settlements dollar per picul [\$0.567 per 133⅓ pounds] to be levied upon all crude rubber exported during the year 1917. In fact, there are rumors of a still higher tax being imposed.

STRAITS SETTLEMENTS RUBBER INDUSTRY AND TRADE.

The American Consul at Singapore, Straits Settlements, reports that the development of the rubber industry in the Malay Peninsula has seriously affected the cultivation of most of the other agricultural products of the country. The cultivation of rice, for instance, was first supplanted in large areas by cocoanuts and later by rubber. From the cultivation of rice the native was able to work out a bare livelihood, but with a small rubber plantation he has the possibility of becoming in a few years a comparatively rich man.

There were imported in 1915, 23,114 tons of crude rubber from the Malay States, 2,198 tons from the Netherlands Indies, and 709 tons from other countries. The figures in 1914 were 9,661 tons, 556 tons, and 274 tons; and 4,073 tons, 188 tons, and 189 tons in 1913.

The exports of crude rubber from the Straits Settlements in 1915 are given as 12,824 tons (value \$13,744,621) to the United Kingdom; 21,075 tons (value \$25,598,597) to the United States, and 4,383 tons (value \$1,776,367) to other countries. In 1914 they totaled 13,376 tons, 4,510 tons, and 2,220 tons, with 7,168 tons, 2,508 tons, and 731 tons, the corresponding figures in 1913.

INCREASED RUBBER EXPORTS FROM SUMATRA.

The American consul at Batavia, Java, reports that exports of plantation rubber from Belawan, Deli (Sumatra), for the first eight months of 1916 amounted to 19,947,704 pounds, compared with 8,300,817 pounds in the corresponding period of 1915. Shipments to the United States increased from 2,309,072 to 5,549,025 pounds. This indicates continued growth in the trade with the United States, which had previously leaped from 67,200 pounds in 1914 to 4,074,560 for the entire year 1916. The figures for eight months are:

Countries	1915.	1916.
United States pounds	2,369,072	5,549,025
Great Britain	4,517,429	3,863,088
Netherlands	948,158	31,592
Straits Settlements	466,158	1,503,999
Totals	8,300,817	10,947,704

DUTCH EAST INDIES RUBBER TRADE.

The latest complete official reports on the rubber trade and industry in the Netherlands East Indies now available are for the calendar year 1915.

As has already been stated in THE INDIA RUBBER WORLD, in consequence of the trouble experienced in shipping merchandise to the United States via the Netherlands at the beginning of the war, all goods from Sumatran ports to the United States in 1915 were shipped either via Java by direct steamer to New York, or via Singapore and Hong Kong to San Francisco and Seattle.

The direct monthly service to the east coast of the United States being found insufficient to meet the increasing demand

for cargo space, was changed to one of three weeks, and still all boats sailed with all the cargo they possibly could carry. Freight rates to New York had increased about 50 per cent by the close of the year, and shippers found that they could send their goods to American Atlantic ports via San Francisco and rail at less expense than by sending by direct steamer from Java to New York.

EXPORTS FROM JAVA.

Of the total crude rubber exports amounting to 14,262,235 pounds, 4,732,264 pounds went to the United Kingdom, 2,831,748 pounds to the Netherlands, 1,024,423 pounds to the Straits Settlements, and 11,000 pounds to France.

Exports of gutta percha amounted to 678,269 pounds; all went to the Netherlands, as did also the exports of gutta jelutong, which amounted to 1,584 pounds.

EXPORTS TO THE UNITED STATES.

Exports of crude rubber to the United States in 1915 amounted in value to \$5,918,570, against \$338,315 in 1914; those of gutta jelutong amounted to \$45,353, against \$4,969 the previous year, and exports of gutta percha were valued at \$31,533 against \$10,007 in 1914.

RUBBER CULTIVATION IN THE NETHERLANDS INDIES.

A report of the International Association for Rubber Cultivation in the Netherlands Indies estimates the total area under rubber in the islands of Sumatra and Java at 570,000 acres, about half of the total capital involved being English, the Dutch interest coming next, while France, Belgium and the United States are represented in the balance. The export of crude rubber from the Dutch possessions for 1915 is given at 18,765 metric tons, of which 11,307 tons came from Sumatra and 7,458 tons from Java. In 1914 the total export was 10,046 tons, of which 6,234 tons came from Sumatra and 3,812 tons from Java. This illustrates the rapid growth of the industry in recent years, and in the case of plantations on the east coast of Sumatra the development of the estates would appear to have been particularly rapid.

CEARA RUBBER FROM NIGERIA.

Reporting on two samples of *Manihot* rubber received from government plantations in Nigeria for analysis and tests, the British Imperial Institute states that the first sample had been prepared by a native from trees three years old, having an average girth of 15 inches at 3 feet from the ground. Sixty trees were tapped 14 times during a period of one month, the total yield of dry rubber being 118 ounces. The rubber was dark brown and in the form of thin, rough sheets. It was in good condition, containing only a small amount of impurities in the form of bark. Its physical properties were quite satisfactory.

The results of chemical examination were as follows:

Loss on washing (moisture and impurities)	Per cent..	5.3
Composition of dry washed rubber:		
Caoutchouc		83.1
Resin		5.3
Protein		9.9
Ash		1.7

The sample was valued at 2s. 1d. per pound in London, with fine hard Para at 2s. 6¾d. per pound, and dark-brown plantation Para crêpe at 2s. 4d. per pound.

The rubber, although derived from young trees, compared favorably in composition with many samples of Ceara rubber previously examined by the Imperial Institute.

The second sample had been obtained from 96 trees which were tapped 26 times during the months of May and October.

During the intervening four months the trees were allowed to rest. They were from three to four years old and varied in girth from 18 to 20 inches at 3 feet from the ground, the majority being about 20 inches. Half of the trees had been tapped during the previous year, but the remainder were being tapped for the first time.

The sample consisted of rough sheet rubber, in pieces measuring about 5 inches square. The color varied from pale to dark brown, but many of the pieces were whitish on the surface. The physical properties of the rubber were good.

A chemical examination gave the following results:

Loss on washing (moisture and impurities).....	Per cent..	8.0
Composition of dry washed rubber:		
Caoutchouc		84.7
Resin		6.3
Protein		7.7
Ash		1.3

The rubber was valued at 2s. 6d. per pound in London (April 3, 1916), with plantation Ceara crêpe at 3s. 2d. per pound and plantation Para crêpe at 3s. 2d. per pound.

This latter sample was also satisfactory in composition. In both cases the amounts of resin and protein were not excessive for *Manihot* rubber, but the loss on washing was rather high.

RUBBER PLANTING IN THE MADRAS REGION OF INDIA.

The Madras Presidency at the present time is the most productive rubber region of British India. The area under rubber cultivation in that Presidency is 12,922 acres, and the number of *Hevea* trees is estimated at 1,636,476. The only other important rubber-producing regions of India are Assam, with 4,681 acres and 137,430 trees, and Burma, with 29,544 acres and 4,011,399 trees. The yield of the Assam plantations is relatively small, but is increasing steadily. The output of crude rubber in Madras in 1913 was more than double that of Burma, where most of the trees have not yet reached a tappable age. Practically all *Hevea* is "stump-planted," stumps being obtained from nursery trees from 9 to 12 months old. At the average rate of development of plantation *Hevea* in India, trees become tappable about four years from the date of stump-planting.

The American consul at Madras reports that in 1915 the United States purchased crude rubber for the first time from India direct, the quantity purchased amounting in value to \$110,035. The exports from the Madras Presidency to all countries showed in the fiscal year 1915-16 an expansion of 50 per cent in quantity, while the value increased 31 per cent. The average value declined from \$99 to \$88 per hundredweight. Shipments to the United Kingdom and Ceylon increased from \$1,675,090 to \$2,065,018, and from \$688,448 to \$937,612, respectively.

The following table shows the quantities and values of exports, with average price per pound, for the last four fiscal years:

Year.	Quantity in Pounds.	Total Value in U. S. Currency.	Value Per Pound in U. S. Currency.
1912-13	888,800	\$1,323,139	\$0.08
1913-14	1,595,900	1,989,101	0.07
1914-15	2,388,600	2,367,714	0.06
1915-16	3,559,300	3,113,262	0.05

RUBBER THEFTS IN THE FAR EAST.

Far Eastern exchanges contain many items relating to thefts of both crude rubber and latex. These thefts appear to be increasing each day, but this is not surprising when one considers the tremendous growth of the rubber-producing industry in that part of the world. In Malaya the records show that the courts are imposing exemplary punishment on rubber thieves, and it appears that the government is seeking to devise a system that will effectively check rubber stealing.

Mr. Pearson's book "What I Saw in the Tropics" will interest every rubber man who aspires to know more about crude rubber production. Price, \$3.

MAURITIUS RUBBER IMPORTS.

Mauritius, the prosperous little British island of the South Indian Ocean, has about 382,740 inhabitants, of which 261,093 are Indians, who make up the laboring element; the balance of the population being composed of Mauritian descendants of the former French and Dutch settlers, and Britishers. The sugar industry is the economic and commercial mainstay of the colony; other products are aloe fiber, manioc, maize, tea, vanilla, coffee, fruits, vegetables, etc.

Official statistics for 1915 show that, besides wearing apparel containing rubber, Mauritius imported \$54,723 of rubber articles, against \$42,442 the previous year.

HEVEA PLANTING IN THE FIJI ISLANDS.

The latest available official reports regarding the rubber plantation industry in the Fiji Islands are for the year 1914.

Rubber planting is still in an experimental stage there. *Hevea* trees from seedlings planted in 1906 at a distance of 17 by 17 feet had attained in 1914 an average girth of 17.1 inches at 3 feet from the ground. Thirty trees tapped about 170 days (in all 4,970 tappings) yielded 22½ pounds of smoked biscuits and 6½ pounds of scrap. Seedlings planted in 1908 attained a girth of 11.4 inches and stumps planted the same year a girth of 11.1 inches; in each case at a height of 3 feet from the ground. In most cases the plots had suffered much from storms.

RUBBER IN UGANDA.

The *Hevea* rubber crop was next in importance to coffee on plantations in Uganda during the fiscal year, 1915-16, according to a report recently published by the Department of Agriculture of the Government of that British colony.

The area under rubber plantation was divided up as follows: 1,072 acres over five years old and 328 acres under five years. In addition to this 4,506 acres over two years old and 238 acres below that age were interplanted with coffee, making a total of 6,144 acres under *Hevea* on regular plantations. Besides these plantation areas, it was estimated that the natives had 1,062 acres under *Hevea* and 2,273 acres under Ceara (*Manihot*) rubber; while the several religious missions had 169 acres of *Hevea* and 121 acres of other rubber.

A comparatively small area had reached the tapping stage, but the exports were rising gradually, being 52,349 pounds in 1915-16 compared with 22,056 pounds in the previous fiscal year.

The output suffered but little from pests and diseases, the small shipments of plantation rubber made realized good prices, so that it is conservative to state that rubber promises to become of considerable importance in the agricultural development of Uganda.

THE RUBBER TRADE IN MALAYA.

By Our Regular Correspondent.

ALL talk in local rubber circles is chiefly concerned with the projected "American invasion." As mentioned in previous articles, American capitalists are taking a lively interest in the Malayan rubber industry, an interest which promises to develop very speedily into active participation in production, and this on a very big scale. Matters have already progressed so far as to justify mention in the realms of government. Speaking at a recent meeting of the federal council of Malaya, Sir Arthur Young, G. C. M. G., who, besides being governor of the Straits Settlements, is the high commissioner of the Federated Malay States, said: "With reference to what has been termed the American invasion I understand that the large company in question do not wish to have land alienated to them. They have no desire to lead to over-production. They want to purchase land already alienated, and, first of all, they wish to find out whether the planters want them to come here or not. It is for the planters to say. There is no law to stop land being sold to Americans."

It is only natural that when the news of this large company's proposed activities became noised abroad among the planting community it had rather a mixed reception. The first impulse was to resent an apparent intrusion on what might be termed "our own preserves," but second thoughts led to a change of view, and now it can be said with confidence that the United States' entry into the great industry of Malaya will be generally welcomed by all in any way connected with it. It is recognized that the putting of capital into a country, while furthering the ends of the capitalists, cannot fail also to increase the prosperity of the country concerned. I have heard it said that planter antagonism to the American invasion is based on fear of "American methods," but this surely is a childish view to take. If, say others, the Americans have anything to teach us in the art of profitably administering our properties, let us learn it all as quickly as possible, for these be days when we need to get the best possible results from all of our possessions. If our methods are as good as any that can be imported, they are not likely to be disturbed, for the newcomers are hardly likely to want change just for the sake of change.

As regards the risk of over-production, if quantities of new capital are introduced, there is no need to tell anyone connected with the trade that the demand for rubber is increasing by such leaps and bounds that any such fears need not be entertained for a moment. It is even possible that there may come again a period of such scarcity as was experienced some ten years ago. There are now trades to which rubber is so essential, and that in vast quantities, that those who have sunk capital in such businesses, feel the necessity of taking a direct interest in the production of the raw material. For one thing in particular they are naturally anxious not to be entirely at the mercy of the market—and the market price—in the matter of supplies. The present time, too, is considered particularly opportune for coming in for the simple reason that the bulk of rubber plantation capital is held in Great Britain, and as the war goes on it will be increasingly difficult to find the money to develop the large number of estates, which are still in need of development. With new British capital for the industry diminishing, there should certainly be companies willing to sell their properties or give part share in them rather than see them run to weed.
